Toxicity of Pb (NO3)2 to five species of algae was measured. Portions of unialgal cultures were inoculated into low salt medium and were used to test all species at 10, 20, and 30 ppm Pb. This medium approximated the salt concentrations of natural aquatic environments. Three different cell weights were used for each concentration of lead and for the control to determine a relationship between cell weight and toxicity. The concentration of lead causing a 50% reduction of C-14 fixation as compared to the control was called the ED-50. The ED-50 for three of the species tested (Anabaena, Chlamydomonas, and Navicula) was between 15 and 18 ppm Pb. A desmid, Cosmarium, had an ED-50 of 5 ppm. This species has a higher surface:volume ratio than the other species tested which accounts for its increased sensitivity. Throughout the experiments the fixation of C-14 increased with increasing Pb concentrations. (See also W73-12321) (Knapp-USGS)

ON THE WATER QUALITY OF LAKE BIWA--KO AND THE INHABITABILITY OF THE BIVALVE, CORBICULA SANDAI, IN THE SETA RIVER, (IN JAPANESE),
Shiga Univ., Otsu (Japan). Faculty of Education.
O. Itasaka, M. Sugita, Y. Okumura, and T. Hori.
Mem Fac Educ Shiga Univ Nat Sci. 20, p 18-34. 1970. Illus. English summary.
Identifiers: *Bivalves, *Corbicula-Sandai, Inhabitability, *Japan (Lake Biwa-Ko), Lakes, Minerals, Rivers, Water quality, Seta River (Japan).

The water quality of both Lake Biwa-ko and the Seta River was investigated 3 times during July to Sept. of 1970. Items for the observation were water temperature, pH, dissolved O2, KMnO4 consumption, total-N, NH3-N, NO2-N, NO3-N, SiO2, total-P, PO4-P and transparency. The present investigation showed that the southern part of the lake was transformed into a eutrophic state in a few years. The survey of bivalve distribution in the Seta River has been continued since 1960. The population density during the decade has decreased to about 0.1.--Copyright 1972, Biological Abstract, Inc.

HYDROGYNAMIC FLUX CONTROL FOR WASTE WATER APPLICATION OF HYPERFILTRATION SYSTEMS,
Oak Ridge National Lab., Tenn.
D. G. Thomas, and R. B. Gallaher.
Copy available from GPO Sup Doc as EP1.23/2: 73-228, $1.25; microfiche from NTIS as PB-222 005, $1.45. Environmental Protection Technology Series Report No EPA-R2-73-228, May 1973. 80 p, 28 fig, 10 tab, 22 ref. EPA Project 17020-FEV. 14-12-896.

Descriptors: Fouling, *Hydrodynamics, Control, Velocity, Filtration, Reverse osmosis, Waste water treatment.
Identifiers: Particulates, Flux control, Flux decline, Hyperfiltration.

The effect of hydrogynamics on flux decline of cellulose acetate hyperfiltration membranes was studied using primary effluent from the Oak Ridge East Sewage Plant as feed. The system contained multiple, annular-geometry housings which could be operated simultaneously at different velocities with the same feed. The range of fluxes studied was from 2 to 150 gal./ft2 day and axial velocities ranged from 3 to 30 ft/sec. System pressure was 600 psig. The results demonatrate that there is a threshold velocity above which flux decline is markedly smaller than at lower velocities. Visual inspection of the membranes after a test indicates that operation above the threshold velocity markedly reduces accumulation of solids during the first 200-300 hours of a test. In scouting studies addition of a flocculant appeared to markedly reduce the threshold velocity. During the initial 200-300 hours of those tests with primary sewage effluent as feed and in which the axial velocity was above the threshold velocity, the flux decline parameter, b, (b ± - (delta log flux)/ (delta log time)) was directly proportional to the six-tenths power of the flux and inversely proportional to the square root of the velocity. ANAEROBIC-AEROBIC TREATMENT OF TEXTILE WASTES WITH ACTIVATED CARBON,
Palisades Industries, Inc., Peace Dale, R.I.
C. P. C. Poon, and P. P. Virgadamo.
Copy available from GPO Sup Doc as EP1.23/2: 73-248, $2.85, microfiche from NTIS as PB-221

985, $1.45. Environmental Protection Technology Series Report No EPA-R2-73-248, May 1973. EPA Project 12090 EQO.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Activated carbon, Adsorption, *Biochemical oxygen demand, *Chemical oxygen demand, Pilot plants, Industrial wastes.
Identifiers: *Total organic carbon.

The operation of an anaerobic-aerobic bio-oxidation treatment system utilizing activated carbon was studied for 24 months at Palisades Industries, Peace Dale, Rhode Island. Biological oxidation and conversion of soluble organic waste constituents took place in the aerated basin operated as a mixed dispersed growth reactor without return sludge. Washed out solids from the aeration basin were filtered by a parallel set of activated carbon columns. The entrapped solids were then hydrolized when these columns were regenerated in place anaerobically. A second parallel set of carbon columns provided for additional removal of solids and soluble organics. However, the biological regeneration in these columns was carried out aerobically. Both the laboratory and the large scale piolot plant experiments revealed (1) good color removal; (2) oxidation of organic chemicals fed to the system; (3) major reduction in BOD and COD in the waste effluent stream; and (4) continued biological regeneration of the activated carbon; and (5) high degree of removal of suspended solids without conventional equipment. This study has demonstrated that waste streams from a typical cloth dyeing and finishing operation can be effectively treated using activated carbon coupled with biological regeneration. The advantages to this system are a result of the catalytic effect rendered by the activated carbon on difficult to degrade organic molecules and the small space requirements in respect to conventional treatment systems for an equivalent degree of treatment. ORANGE COUNTY WATER DISTRICT'S WATER FACTORY 21,
Orange County Water District, Santa Ana, Calif.
J. R. Cofer.
J Irrig Drain Div, Am Soc Civ Eng, Vol 98, No IR4, p 553-567, Dec 1972. 7 fig, 3 tab.

Descriptors: *Water reuse, *Desalination, *Groundwater recharge, Waste water treatment, Water treatment, Sanitary engineering, Water management (Applied), Desalination plants, Desalination processes, Environmental effects, Injection wells, Groundwater, Costs, *California.
Identifiers: Orange County (Calif), Vertical tube unit, Waste water use, Multistage flash distillation, Salt water barriers.

An advanced design fresh water factory is being constructed in Orange County, California. The factory consists of waste water reclamation plant and sea water desalting module to supply fresh water to a 30 mgd sea water barrier ground water basin replenishment system. The paper describes the advanced waste water reclamation plant and sea water desalting plant being implemented by the Orange County Water District, and the utilization of the product water from the 2 plants in the ground water injection program. The waste water reclamation process includes: lime coagulation, ammonia stripping, recarbonation, mixed media filtration, activated carbon adsorption, chlorination, and blending. The sea water desalting plant will use the vertical tube evaporation multistage flash process. Use of waste heat from the desalting plant in the reclamation process, and the resolution of adverse environmental impacts are analyzed; long-range implications of the fresh water factory in the management of the ground water basin are postulated. MANURE SLURRY IRRIGATION SYSTEM RECEIVING LOT RUNOFF,
Tennessee Univ., Knoxville. Dept. of Agricultural Engineering.
J. I. Sewell.
Paper presented at 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, Paper no. 72-443, 13 p, 7 fig, 5 ref.

Descriptors: *Pollution abatement, Runoff, Groundwater, *Slurries, Irrigation systems, *Cattle, Farm wastes, Waste disposal, Management, Feed lots.

Plans for facilities and system design for a manure slurry irrigation system are presented. This system consisting of a storage tank, chopper-agitator-pump unit, flush pits, irrigation pipe and a large sprinkle performed durably in testing and offered possibilities for improved efficiency in manure management. It created a minimum of pollution problems. The operational plans and system costs are outlined. (Fomby-East Central)

USE OF DUCKWEED FOR WATER TREATMENT AND ANIMAL FEED,
Louisiana State Univ., Baton Rouge. School of Forestry and Wildlife Management.
D. D. Culley, Jr., and E. A. Epps.
Journal Water Pollution Control Federation, Vol 45, No 2, p 337-347, February, 1973. 1 fig, 5 tab, 28 ref.

Descriptors: *Farm wastes, Waste water treatment, Farm lagoons, Nutrient removal, Feeds, Livestock.
Identifiers: *Duckweed, Lemnaceae.

This scientific study was established to search for aquatic plants suitable for nutrient reduction in animal waste lagoons and for utilization in animal feeds. Criteria for evaluating the aquatic plants are given. Chemical composition of plants from the family lemnaceae are shown in tables based on eight test sites. Duckweed shows great potential, but minor problems include toxic buildup and excess water content. (Marquard-East Central)

HOUSED CONFINEMENT - AN ANSWER FOR FEEDING IN NORTHERN CALIFORNIA,
E. W. Manthey.
Feedlot Management, Vol 14, No 2, p 10-16, February, 1972. 6 photos, 1 fig.

Descriptors: *Feed lots, *Waste disposal, *Farm wastes, California, Confinement pens, Cattle.
Identifiers: Cow toilet.

Physical facilities are described and pictured for a housed feedlot that takes advantage of northern California's market and feed supply and overcomes the problem of the wet season. Construction time/cost are cut by new methods of casting concrete slotted floors in place. The pit beneath the lot is scraped continuously by a cable driven blade and disposed of on 160 acre fields by sprinkle irrigation. Rain runoff and overflow of troughs are piped to a pond. (Marquard-East Central)
W73-11770

THE OPCCO DRYER.

Agricultural Engineering, Vol 53, No 6, p 16-17, June, 1972. 2 fig.

Descriptors: *Recycling, Drying, Fertilizers, *Farm wastes, *Waste treatment, Poultry, Feeds.

A solid waste management system, developed and patented by Harvey Wenger and manufactured by Organic Pollution Control Corp., has been placed on several large poultry farms to turn poultry litter into fertilizer or into a feed additive for livestock. Michigan State University's Dr. Howard Zindel and other experts feel that the dryer, used so far primarily with poultry manure, can successfully handle all forms of animal wastes plus packing house offal, vegetable and fruit peel and pulp, and municipal sewage. Requiring an area of about 20-40 feet, the 40 ton per day unit operates on either natural or LP gas. Plans for developing other power supplies are being studied. The drying process is described and a schematic of the flow path is shown. The process is not inexpensive, but it does supply a solution to the waste problem. (Wetherill-East Central)

BEEF CATTLE FEEDLOT RUNOFF, SOLIDS TRANSPORT AND SETTLING CHARACTERISTICS,
Nebraska Univ., Lincoln.
C. B. Gilbertson, J. A. Nienaber, T. M. McCalla, J. R. Ellis, and W. R. Woods.
Transactions of the ASAF (American Society of Agriculture Engineers), Vol 15, No 6, p 1132-1134, 1972, 6 fig, 8 ref. Support in part by EPA.

Descriptors: *Feed lots, Runoff, Continuous flow, *Farm wastes, Cattle, *Waste water treatment.
Identifiers: *Solids removal systems, Batch system.

Removing settleable solids from beef cattle feedlot runoff requires a working knowledge of the relationships between precipitation, runoff, solids, transport, and settling of the transported solids. The authors give physical descriptions of the working area and develop estimating equations which can be used to assist in design of solids removal systems in geographic areas with similar climatic and feedlot conditions. Two systems, a 'batch system', and a 'continuous flow' system, were constructed. In laboratory tests (Imhoff cone tests), about 40% of the total solids transported (by weight) settled in 16 to 18 minutes at zero velocity of flow. Calculated bulk density of settleable solids was 6.71 lb. per cu. ft. with a standard deviation of 3.69 lb. per cu. ft. It was recommended that an open channel should be equipped with barriers to restrict runoff flow to near zero velocity to remove sufficient solids to maintain a satisfactory condition within the holding pond. (Wetherill-East Central)
W73-11774

PERFORMANCE OF BEEF ANIMALS AS AFFECTED BY CROWDING AND THERMAL ENVIRONMENT DURING A FALL-WINTER PERIOD,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
G. W. A. Mahoney, A. F. Butchbaker, and J. I. Fryrear.
Paper presented at 65th Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, Paper No, 72-426, 18 p, 5 fig, 1 tab, 6 ref.

Descriptors: Production, Cattle, Windbreaks, *Oxidation lagoons, *Waste water treatment, *Farm wastes, Productivity, Feeds.
Identifiers: Crowding, Slotted floors, Weight gain.

Results of feed trials made in fall-winter periods of 1969-1972 are reported. The objectives of these trials were: (1) Compare production and feed consumption for 3 levels of crowding, (2) Compare production and feed consumption rates for cattle on slotted floors with wind breaks and shades with cattle in open cattle pens, (3) Determine performance of a cattle waste oxidation ditch for fall-winter operation in the Southwest. Corresponding results were: (1) Maximum gains and feed efficiency were obtained at approximately 20-22 square feet per animal. (2) Weight gain of cattle on slotted floors was not significantly greater than those in open pens, (3) Cold weather freezing indicated that enclosure of oxidation ditches might be necessary for their effective use in the Southwest. (Marquard-East Central)
W73-11776

OBSERVATIONS OF DAIRY MANURE HANDLING SYSTEMS,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
D. W. Bates.
Paper presented at 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, Paper No 72-413, 3 p.

Descriptors: *Waste disposal, *Waste storage, *Farm wastes, Waste treatment, Cattle, Dairy industry.
Identifiers: Stall barn, Stacking system, Bedding, Solid alleys, Slatted alleys, Liquid manure systems.

Because of the need to reduce labor in handling manure, the cost of bedding, and regulations dealing with the handling and disposition of animal manure, old manure disposal methods are being replaced by new. Various systems for the daily hauling will depend somewhat on whether the farmer has a stall barn or free-stall barn. Slatted or solid alleys, automatic scrapers, and a new manure pump which forces manure from a collection point in the barn through a pipe to an external manure pit for storage and later removal are discussed. Storage capacity is an important facet for dairymen, particularly in the colder regions of the country. Advantages of figuring construction costs prior to building, and disadvantages of 'adding on' are discussed. (Dudley-East Central)
W73-11777

ANOTHER POSSIBLE PROCESS FOR MANURE.

Calf News, Vol 11, No 1, p 38, January, 1973.

Descriptors: Feedlots, Farm wastes, *Waste treatment, Fertilizers, Ammonia.

A theory has been developed for the processing of manure which could produce 1,000 tons of ammonia per day from the manure deposits of around 600,000 cattle. This theory proposes that the manure be partially oxidized in the presence of the correct amount of air so that a synthetic gas is produced in the correct ratios to be used for ammonia production. By this process, the manure would be converted into an easily transported fertilizer which then would go back to the land to insure high crop yields. This process may also prove an answer to the problem of cattle feedlot pollution. (Anderson-East Central)
W73-11780

A LOVELY NEW SCENT FOR MANURE.
Calf News, Vol 9, No 10, p 4. October, 1971.

Descriptors: *Air pollution, *Sagebrush, *Farm wastes, Odor, Water pollution control.

A method of reducing manure odor with a sage brush feed additive has been discovered. This additive, which causes continuous production of volatile oils in manure and urine, seems to improve the health of the cattle with no detectable change in the taste of the beef. Plans for future research include spraying of feedlots with sage oils. The oils can be synthetically produced, but there is an abundance of natural sage. The product is not yet commercially available. (Fomby-East Central)
W73-11783

FIVE FEEDING SYSTEMS COMPARED.
Feedlot Management. p 34-37, January, 1971. 8 fig.

Descriptors: *Feed lots, Performance, Runoff, *Farm wastes, Cattle, Confinement pens.
Identifiers: Animal density, Open lot, Open shed, Cold barn, Warm barn.

Preliminary results are given on the influence of various housing systems on beef cattle and the effect of animal density on feedlot performance. It is indicated that housed confinement should be used to capacity and maintained year round for maximum benefits. Housed confinement tends to control illness and high density does not seem to jeopardize health or feed efficiency. Advantages and disadvantages are given for each type of housing studied. The five types of housing are open lot, open shed, manure pack shed, cold barn and warm barn. All five systems are designed to contain all animal wastes. (East Central)
W73-11784

FEEDERS HEAR WOES OF CONFINEMENT START.

Beef, p 16-17. July, 1971.

Descriptors: Ammonia, Feed lots, Waste storage, *Farm wastes, Oxidation, Proteins, Iowa, *Oxidation lagoons, Waste water treatment, Livestock.

Problems of an oxidation ditch at Iowa State University are described. Because the start-up period was during the winter, ammonia foam resulted. Later, equipment malfunctions, protein foam, and freezing of sewage created problems. How each problem was met, is described. (Marquard-East Central)
W73-11787

FEED 'EM TRASH, CUT POLLUTION.
Beef, p 12. July, 1971.

Descriptors: Cellulose, Brush control, *Farm wastes, *Recycling, Proteins, *Feed lots, Texas, Feeds.

Texas Tech researchers have devised a process that takes paper, manure, brush, or any substance with cellulose and converts it to protein and sugar. The product can be used for animal feed and possibly in the future for human consumption. (Marquard-East Central)

SEWAGE TREATMENT SYSTEM,
Missouri Engineering Corp., Rolla. (assignee)
R. A. Lemberger, and J. L. Gilmore.
U.S. Patent No 3,724,664, 6 p, 9 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 178, April 3, 1973.

Descriptors: *Patents, Equipment, *Sewage treatment, *Aeration, *Waste water treatment, *Water quality control, *Water pollution control, *Pollution abatement.
Identifiers: Settlement, Water pollution prevention.

This system consists of the following items: a below-ground tank for receiving sewage; an effluent sprinkler above ground; a pump with a discharge end; a connection between the pump and sprinkler; and a connection between the tank end and the discharge end of the pump. The tank is divided into a settlement chamber and an aeration chamber. The pump is situated within the aeration chamber. Safety float switches are advantageously placed. A control valve is of a two position character; in one position, effluent is recirculated within the aeration chamber, and in the other position, effluent is discharged through the sprinkler for dispersion. The operation of the control valve and pump is governed by a timer. (Sinha-OEIS)

APPARATUS AND SYSTEM FOR REMOVAL OF LATEX FROM WASTE WATER,
Clarkson Industries, Inc., New York. (assignee)
W. H. Scott, Jr.
U. S. Patent No 3,726,794, 4 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 909, No 2, p 683, April 10, 1973.

Descriptors: *Patents, Equipment, *Waste water treatment, *Chemical reactions, Sludges, *Pollution abatement, *Industrial wastes, *Water quality control, *Water pollution control.
Identifiers: *Chemical treatment, Latex.

Waste water containing latex is led into a mixing compartment where treating chemicals are also deposited. The mixture is moved to a settling tank and then disposed in a polishing tank where other chemicals are added to the mixture. The settled sludge is removed by an endless conveyor. The chemicals to be used are not identified. Details are given on the control and pumping systems. (Sinha-OEIS)
W73-11874

WASTE WATER TREATMENT SYSTEM,
E. T. Armstrong.
U.S. Patent No 3,730,881, 12 p, 12 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 910, No 1, P 289, May 1, 1973.

Descriptors: *Patents, *Waste water treatment, *Sedimentation, Trickling filters, *Activated sludge, *Disinfection, Aerobic conditions, *Biological treatment, *Pollution abatement, *Water quality control, *Water pollution control, Ozone.
Identifiers: Flotation separation, *Water pollution prevention.

This system includes a primary sedimentation tank, a primary bioprocessing tank, and a primary disinfection tank, all of which operate with the influent under aerobic conditions. Means are provided to receive raw waste at the input to the pri-

mary sedimentation tank and pass it throughout the system to the output of the disinfection tank. Explanations are given on the use of microorganisms in waste treatment, the settling or sedimentation process, flotation separation. roughing (trickling filter), bioprocessing second stage activated sludge, system optimization and the characteristic load, the disinfection system, force main injection and on system integration. Structural improvements in settling reduce velocity, inhibit boundary layer separation and act to suppress mixing of the sewage. In the bioprocessing operations, the key is to improve efficiency of the liquid-gas exchange to achieve better oxygen contact. The liquid-gas exchange feature utilizes a high momentum exchange under turbulent flow conditions in a hydraulic pressure gradient. (Sinha-OEIS)
W73-11878

INTERNAL PRECIPITATION OF PHOSPHATE IN SETTLING ZONE,
Biospherics, Inc., Rockville, Md. (assignee)
G. V. Levin, and G. J. Topol.
U.S. Patent No 3,730,882, 3 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 910, No 1, p 289, May 1, 1973.

Descriptors: *Patents, *Sewage treatment, *Biochemical oxygen demand, *Phosphate, Nutrient removal, Microorganisms, *Aeration, *Biological treatment, *Pollution abatement, Activated sludge, *Water pollution control, *Water quality control, *Water resources.
Identifiers: *Water pollution prevention.

A process is described for treating raw or treated sewage to obtain a substantial phosphate-free effluent which is to be disposed in natural water resources. Influent sewage is mixed with activated sludge to provide a mixed liquor. The mixed liquor is passed to an aeration zone to reduce its BOD content. The microorganisms present in that zone take up the phosphate. In the settling zone, phosphate-enriched sludge settles into the anaerobic layer and the phosphate-free effluent is removed from above the layer of sludge. A phosphate precipitant is added to the sludge holding soluble phosphate in the liquid phase thereof to precipitate the water soluble phosphate. There results a mixture of precipitated phosphate particles, sludge organisms that have given up intracellular phosphate and a phosphate-depleted aqueous phase. This mixture is recycled for mixing with influent sewage. One example is cited. (Sinha-OEIS)

SEWAGE DISPOSAL METHOD,
L.A.A. Lefrancois.
U.S. Patent No 3,730,883, 3 p, 1 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 910, No 1, p 289, May 1, 1973.

Descriptors: *Patents, *Waste water treatment, *Agriculture, *Food processing industry, *Fermentation, *Microorganisms, *Aeration, *Pollution abatement, *Water quality control, *Water pollution control.
Identifiers: *Water pollution prevention.

Waste liquid is introduced continuously into a fermentation apparatus in order to preserve throughout the liquid mass a homogeneity of the solid, liquid, and gaseous fractions, and to ensure a maximum dispersion of the microorganisms. Air is blown continuously into the apparatus in order to further ensure the dispersion of the microorganisms. The liquid more or less loaded with organic substances, such as activated sludge, is drawn off continuously from the fermentation apparatus to maintain a constant mass of treated liquid in the apparatus. (Sinha-OEIS)

METHOD AND APPARATUS FOR DETERMINING OXYGEN CONSUMPTION RATE IN SEWAGE,
Robertshaw Controls Co., Richmond, Va. (assignee)
R. D. Mikesell.
U.S. Patent No 3,731,522, 4 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 463, May 8, 1973.

Descriptors: *Patents, *Sewage treatment, *Dissolved oxygen, Bacteria, *Waste water treatment, *Oxygenation, Equipment, *Pollution abatement, *Water quality control, *Water pollution control.
Identifiers: *Water pollution prevention.

The continuous respirometer provides an indication of the rate at which oxygen is being consumed by the bacterial population in the sewage. A means for sensing the amount of oxygen in the fluid entering the container is provided as well as a means for sensing the amount of oxygen exhausted at the outlet. A pump is provided for circulating the sewage through the closed container at a constant flow rate so that the amount of dissolved oxygen in the sewage may be determined. The respirometer may be adapted for use in natural water bodies. (Sinha-OEIS)
W73-11883

LIQUID FILTER,
T. M. Walters.
U.S. Patent No 3,731,814, 7 p, 15 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 538, May 8, 1973.

Descriptors: *Patents, Filters, *Filtration, Equipment, *Water treatment, *Pollution abatement, *Water pollution control, *Water quality control.
Identifiers: *Water pollution prevention.

The filter uses one or more drum-like inner chambers in which both the cylindrical surface and the flat circular surfaces of an inner chamber are provided with filter screens. The interior of the drum-like inner chamber is provided with washer arms adjacent to all filtration screens in such manner that relative motion of the arms to the drum causes the washer arms to squeeze out or scoop up the liquid within the drum and push this liquid outward through the screens. Trial and error experiments determine the proper rotational speed for the chosen surface area of the screen and the size of the screen mesh. (Sinha-OEIS)

SUBMERGED FILTER-HORIZONTAL FLOW MODE,
Research Corp., New York. (assignee)
J. W. Klock.
U.S. Patent No 3,732,160, 5 p, 3 fig, 5 ref; Official Gazette of the United State Patent Office, Vol 910, No 2, p 621, May 8, 1973.

Descriptors: *Patents, *Waste water treatment, *Filtration, Oxygen, *Aerobic conditions, Equipment, *Pollution abatement, *Sedimentation, *Gravity, Separation techniques, *Water quality control, *Water pollution control.
Identifiers: *Water pollution prevention, *Biochemical treatment.

Waste-containing liquor is biochemically treated in a tank or cell by continuously recirculating it through a filter media which is submerged in the liquor while continuously withdrawing a small portion of the liquor. A pressurized column of oxygen-containing gas entrains and lifts the liquid waste through an unobstructed tube and recirculates it horizontally through the filter media. During the lifting process oxygen from the fluid permeates the waste in order to ensure active aerobic metabolism. The tank may be arranged in series with other similar tanks utilizing horizontal flow through the filter media, or one or more of such tanks may be arranged in combination with one or more tanks having vertical flow through the filter media. In the horizontal mode, the waste is in contact with the culture while moving horizontally through the filter media, thus including waste separation by gravity sedimentation in addition to impact removal. MANAGEMENT OF RECYCLED WASTE--PROCESS WATER PONDS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Engineering Science.
C. E. Renn.
Copy available from GPO Sup Doc as EP1.23/2:73-223, $0.85; microfiche from NTIS as PB-222 060, $1.45. Environmental Protection Technology Series Report EPA-R2-73-223, May 1973. 49 p, 5 fig, 3 tab, 5 ref. EPA Project WPD 117.

Descriptors: *Water reuse, *Biological treatment, *Water purification, *Aerated lagoons, Waste assimilative capacity, Industrial wastes, Waste water treatment, Industries.

Successful operation is described of a storage pond used to collect treated waste waters and runoff for recycle to manufacturing operations under conditions of drought and severe water shortages. Treated sewage and cafeteria wastes are stored in an air sparger mixed pond and are returned to the manufacturing plant to provide water for evaporative cooling and a variety of production processes. By applying long term storage, air sparger agitation, and controlled stratification during the summer, it has been possible to increase the effectiveness of limited well supplies from six to fifteen times. The efficiency of the pond depends in larger part upon biological processes that go on in the comparatively shallow areas of the system. These act to capture phosphorus and to stabilize algal organics generated in the pond itself. (EPA)
W73-11889

NITROGEN REMOVAL FROM WASTE WATER BY BREAKPOINT CHLORINATION,
Environmental Protection Agency, Washington, D.C. (assignee)
T. A. Pressley, and D. F. Bishop, Jr.
U.S. Patent No 3,732,164, 7 p, 4 fig, 2 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 622, May 8, 1973.

Descriptors: *Patents, *Waste water treatment, *Nutrient removal, Nitrogen, *Chlorination, Ammonia, *Domestic wastes, *Sewage treatment, Chemical reactions, *Pollution abatement, *Water quality control, *Water pollution control.

A method is described for the removal of bound nitrogen from waste water by the use of breakpoint chlorination. (1) Feeding a stream of waste water having an NH3 - N content of about 8 - 30mg./l. to a mixer-reactor; (2) Feed a stream of chlorine material, selected from the group consisting of an alkali metal hypochlorite and free chlorine, to the mixer-reactor in an amount of about 65 - 300 mg./l. of chlorine to provide a ratio of Cl:NH3 of about 8-10:1; (3) Maintain the pH within the mixer-reactor at a value of about 5.8 to 9.5; (4) Thoroughly mix the streams in the mixer-reactor immediately upon the entrance of the streams to the mixer-reactor so as to provide the pH value of about 5.8 to 9.5 uniformly throughout the reactor and to insure a uniform breakpoint chlorination reaction. (Sinha-OEIS)
W73-11890

ACTIVATED SLUDGE SEWAGE TREATMENT PROCESS AND SYSTEM,
Air Products and Chemicals, Inc., Allentown, Pa. (assignee)
M. L. Spector, R. D. Jones, and C. S. McDowell.
U.S. Patent No 3,733,264, 5 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 910, No 3, p 901, May 15, 1973.

Descriptors: *Patents, *Sewage treatment, *Activated sludge, Aeration, Oxygen, *Pollution abatement, *Water pollution control, *Water quality control, Biochemical oxygen demand.
Identifiers: *Atmospheric air.

This process consists of the following steps: biodegradable waste influent and activated sludge form a mixed liquor which is introduced into a first covered aeration zone; oxygen-rich aeration gas is introduced into this aeration zone; the partially BOD reduced mixed liquor is passed into a subsequent covered aeration zone; a second aeration gas composed of atmospheric air is introduced into the subsequent aeration zone in which the oxygen content is held below 35% by volume until the BOD is reduced to a predetermined level. The system is designed so that between 15 and 95% of the oxygen utilized by the mixed liquor is used in the first aeration zone and the remainder in the second zone. (Sinha-OEIS)
W73-11892

PROCESS FOR COAGULATING AND AGGLOMERATING PARTICULATE MATERIAL WITHIN A LIQUID MEDIA,
J. W. Gooch.
U.S. Patent No 3,733,269, 4 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 910, No 3, p 903, May 15, 1973.

Descriptors: *Patents, *Water treatment, Chemical reactions, *Coagulation, *Centrifugation, Hydrogen sulfide, Organic wastes, Suspended solids, *Waste water treatment, *Filtration, *Water pollution control, *Water purification, Ammonia, Halogens, Carbon dioxide, Ozone, *Industrial wastes, *Food processing industry, *Pulp and paper industry, *Pollution sources, *Pollution abatement, *Water quality control.
Identifiers: *Chemical treatment, Agglomeration, Decanting, Sulfur dioxide.

A reagent solution is released and dispersed within a waste stream in the form of a microscopically gaseous phase which is adsorbed on the surfaces of the suspended solids and organic waste materials to produce surface characteristics which induce agglomeration and coagulation of the solids. These may be removed by decanting, filtration, or centrifugation. Preferred reagents include ammonia, hydrogen sulfide, halogen compounds, carbon dioxide, sulfure dioxide and ozone. Temperatures from 80 to 700C produce suitable results. Seven examples are cited. (Sinha-OEIS)
W73-11894

METHOD AND APPARATUS FOR ECOLOGICAL RECYCLING OF WASTE PRODUCTS TO PRODUCE FERTILIZER AND GARDEN PLANT NUTRIENTS,
C. H. Carothers.
U.S. Patent No 3,728,254, 6 p, 10 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 1054, April 17, 1973.

Descriptors: *Patents, *Waste treatment, *Waste water treatment, *Aeration, Equipment, Nutrient removal, *Domestic wastes, *Activated sludge, *Pollution abatement, *Water quality control, Water pollution control, Fertilizers, Nutrients, Waste disposal.
Identifiers: Settlement, *Water pollution prevention.

Urban waste is disposed through the utilization of activated sludge, sanitary sewage treatment plants. Solid wastes are comminuted and then introduced into a flowstream passing through sanitary sewage lines being led into a treatment plant. The combined effluent is introduced into conventional aeration tanks which have been modified to provide supplemental aeration. The combined liquor is then removed to a settling tank. A portion of the activated sludge which settles out is returned to the aeration tank to serve as an aeration catalyst, the remainder is removed for processing to convert it for use as a plant food. The final effluent is substantially nutrient free water which may be discharged without damage to environmental water resources. (Sinha-OEIS)
W73-11895

DOMESTIC SEWAGE TREATMENT PLANT,
Sanitary Disposal Systems, Inc., Wheat Ridge, Colo. (assignee)
J. S. Stone.
U.S. Patent No 3,731,812, 9 p, 7 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 538, May 8, 1973.

Descriptors: *Patents, *Waste water treatment, *Domestic wastes, *Sewage treatment, *Tertiary treatment, *Filtration, Filters, *Aeration, *Aerobic treatment, Pollution abatement, Dissolved oxygen, *Water pollution control, *Water quality control.

A tertiary treatment domestic sewage treatment plant effects particle size reduction by hydraulic action, utilizes extended aeration and adiabatic cooling of the surface of the treating bath to enhance oxygen absorption and is provided with a living filter. The filter differs significantly from the conventional trickling filter in that the flow is reversed, the flow passages are considerably smaller and it is completely submerged. The filter is a living mass, composed of aerobic saprophytic bacteria, fungi, algae, protozoa, crustaceae, rotifera and worms. This mass thrives as a natural ecological succession with a controlled environment. Hydraulic displacement from below furnishes food as finely divided suspended, colloidal and dissolved solids. Continuous aeration from below furnishes dissolved oxygen to assure a completely aerobic process. (Sinha-OEIS)
W73-11897

LIQUID FILTERING APPARATUS,
I. Pistiner.
U.S. Patent No 3,722,682, 5 p, 6 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 967, March 27, 1973.

Descriptors: *Patents, *Waste water treatment, *Liquid wastes, *Filtration, Filters, *Water treatment, *Water purification, *Pollution abatement, *Water quality control, *Water pollution control.

A self contained liquid filtering apparatus is described. A filtering chamber is provided at the top of an elongated frame structure. This frame structure supports also toggle actuated devices for opening and closing end gates at the open ends of the filtering chamber in order to permit the advancing of a filtering sheet that is taken from a roll supported upon the frame and is drawn by a motorized roller through the end openings of the filtering chamber upon the end gates being lifted by toggle devices. An evacuating apparatus is provided within the frame structure for removing the liquid from the filtering chamber prior to the opening of the end gates and the advancing of the filtering paper from its roll and adapted to return the liquid to the filtering chamber when the new filter area has been provided. The filtered liquid removed from the filtering chamber may be collected in a tank and returned to the filtering chamber so as to be refiltered. Fluid cylinder devices are used for the actuation of the toggle gate operating mechanisms. For the evacuating cylinder device appropriate valves are used in the liquid pipelines to control the flow of the liquid into and out of the filtering chamber. (Sinha-OEIS)
W73-11898

RADIOACTIVE WASTE MANAGEMENT AT HANFORD,
Atlantic Richfield Hanford Co., Richland, Wash.
G. R. Kiel.
Available from NTIS, Springfield, Va., as ARH-SA-113; $4.00 in paper copy, $1.45 in microfiche. Report ARH-SA-113, 1972. 12 p. AEC-AT (45-1)-2130.

Descriptors: *Nuclear wastes, *Waste storage, *Waste disposal, *Washington, Columbia River, Soil properties, Absorption, Ion exchange, Ponding, Waste water disposal, Underground waste disposal, Public health, Seepage, Leakage, Linings, Monitoring.

Efforts are being made to eliminate discharge of radioactivity to soil at Hanford. In the past low-level-liquid waste (process cooling water and laundry waste) was retained in ponds such that the radioisotopes were sorbed by soil beneath the pond. Intermediate-level-liquid waste from chemical reprocessing was largely recycled, but a small part was discharged to long, narrow trenches that were filled with gravel and backfilled with soil. Input was discontinued when ground-water sampling indicated saturation of the soil sorptive capacity. Pending conversion to solid form, high-level waste was stored in underground tanks with leak-detection facilities. (Bopp-ORNL)
W73-11915

SOLIDIFICATION OF MEDIUM ACTIVITY LIQUID RESIDUES WITH BITUMEN (SOLIDIFICTION PAR LE BITUME DE RESIDUS LIQUIDES DE MOYENNE ACTIVITE),
Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
G. Lefillatre, L. Rodi, J. Champeau, R. Hullo, and L. Pecout.
Available from NTIS, Springfield, Va., as CEA-R-4378; $5.45 per copy, $1.45 microfiche. Report CEA-R-4378, Feb. 1973. 90 p, 53 fig, 18 tab, 8 ref.

Descriptors: *Nuclear wastes, *Leaching, *Public health, *Waste treatment, Treatment facilities, Radioactive waste disposal, Feasibility studies, Asphalt, Chemical precipitation, Diatomaceous earth, Laboratory tests, Pilot plants, Radioactivity effects, Burning, Strontium radioisotopes, Methodology.
Identifiers: Cesium radioisotopes.

Several nuclear fuel reprocessing wastes including ion exchange resins and diatomaceous earth were incorporated into asphalt matrixes in pilot-plant studies. Product leachability was reduced by prior coprecipitation with barium sulfate and nickel ferro-cyanide. Asphaltization of coprecipitates from various waste types reduced leachability 10-100 fold. Further treatment of the product by direct-distillation coating with a 6-mm layer of asphalt reduced leachability from about 0.1% after 2 years of immersion in water to zero after 3 years of immersion. Products of low leachability were produced by using aniomic or non-ionic asphalt emulsions or molten asphalt, but a cationic adhesive agent was unfavorable with one waste type. Segregation of the products were studied at elevated temperature, and flammability and radiation stability were tested. (Bopp-ORNL)
W73-11922

AN INVESTIGATION OF TRITIUM DECONTAMINATION,
Florida Univ., Gainesville.
J. A. Wethington, Jr.
Available from NTIS, Springfield, Va., as ORO-4201-2; $4 in paper copy, $1.45 in microfiche. Re-

port ORO-4201-2, 1972. 28 p, 8 tab, 25 ref. AEC AT-(40-1)-4201.

Descriptors: *Tritium, *Isotope studies, *Water pollution treatment, *Catalysts, Water properties, Nuclear wastes, Feasibility studies.

Catalysts for the interchange of the tritium in HTO with methane were tested in connection with potential applications in decontamination of waste water from nuclear or thermonuclear powerplants. In the absence of a catalyst, there was no interchange at 300 C and 3000 psig. Pt on alumina was subject to poisoning, but Rh on alumina was not. Wilkinson's catalyst and certain soluble Pt compounds were considered outstanding. It appeared that certain natural rocks may have catalytic activity, but not two rock samples from the Rio Blanco test site for nuclear stimulation of gas wells. (Bopp-ORNL)

UPPER TRINITY RIVER BASIN COMPREHENSIVE SEWERAGE PLAN, VOLUME III, MANAGEMENT AND FINANCE PROGRAM.
Peat, Marwick, Mitchell and Co., Dallas, Tex.

Descriptors: *Sewerage, *Management, *Financing, *Regional Development, Texas, Administration, Comprehensive planning, Manpower, Personnel, Regulation, Bond issues, Loans, Grants, Investment, Sewage districts.
Identifiers: Upper Trinity River Basin (Texas), *Dallas-Fort Worth (Texas).

A management and financial plan for a regional comprehensive sewerage plan for Upper Trinity River Basin was developed following an engineering study of the area. The engineering report found that total population in this area (the Fort Worth-Dallas, Texas area) was about 2.7 million and is estimated to increase to 7.8 million by 2020. It was reported that about 53 sewage treatment plants operate in the metropolitan Fort Worth-Dallas region. It was recommended that 6 regional plants be constructed in the metropolitan area, that 47 plants be eliminated and that additional plants be constructed outside the metropolitan region. No definite cost data were developed by the previous studies. In this study, organizational and financial arrangements from other parts of the country are examined and recommended systems for the region are described. State and federal agencies would set water treatment standards. Joint systems at the local level are recommended for the operation of the treatment plants controlled by the regional North Central Texas Council of Governments. This organization would establish policy and provide for coordination of water resource development. No new governmental agency would need to be developed. Initial cost would be about $269 million by 1975, increasing to $577 million by the year 2020. Suggested financing includes: (1) municipal revenue bonds, (2) federal grants and (3) state grants. (Poertner)
W73-12010

A WATER AND SEWER PLAN: CLARKE COUNTY, GEORGIA.
Mayes, Sudderth and Etheredge, Inc., Atlanta, Ga.

Northeast Georgia Area Planning and Development Commission, Athens, April 1969. 89 p, 12 fig, 8 tab.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Regional development, Sewers, Water supply development, Data collections, Financing, Georgia, Optimum development plans, Financial feasibility, Forecasting.
Identifiers: *Clarke County (Georgia).

A comprehensive water and sewer plan for Clarke County was developed as part of an area-wide water and sewer plan prepared for the northeast Georgia Area Planning and development Commission. The primary purpose was to develop recommendations for providing water supply and sewer systems to rural areas of the County and incorporated communities under 5,500 population. A large part of Clarke County is considered urban and has been excluded from the study. This leaves only the rural fringe and the community of Winterville, which has 500 residents. Clarke County is located in northeast Georgia, about 70 miles east of Atlanta. Rainfall averages 48 inches per year and average Fahrenheit temperatures range from 46 in December to 79.5 in July with a yearly average of 62 degrees. The total 1960 population was 45,363 and is expected to grow to about 97,000 by 1990. The City of Athens recorded a 1960 population of 31,355 and is the largest urban community. Future population increases are expected mainly in the Athens area and rural areas near Athens. The county has adequate surface water supplies in rivers, but there are no lakes in the County although a reservoir occupying from 12,500 to 25,000 acres has been proposed. Domestic water supplies are obtained from wells and the City of Athens has extended water mains along most of the major and secondary thoroughfares into most parts of the County. The City participates in the cost of installing sewage collection and treatment systems and assumes operation and maintenance of such facilities. Although the water supply system will probably be sufficient for future development, a regional sewerage system plan is recommended. (Poertner)
W73-12013

A WATER AND SEWER PLAN: BARROW COUNTY, GEORGIA.
Mayes, Sudderth and Etheredge, Inc., Atlanta, Ga.

Northeast Georgia Area Planning and Development Commission, Athens, June 1969. 130 p, 26 fig, 8 tab.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Regional development, Sewers, Water supply development, Data collections, Financing, Georgia, Optimum development plans, Financial feasibility, Forecasting.
Identifiers: *Barrow County (Georgia).

A water and sewer plan for Barrow County was prepared as part of a comprehensive water and sewer plan for the Northeast Georgia Area Planning and Development Commission. Financed by the Farmers Home Administration of the USDA, this study focused on rural areas and communities under 5,500 population. Total county population in 1966 was 15,000 and there are five communities with populations between 300 and 5,500 persons. By 1990, the population of the County is expected to increase to between 18,300 and 21,600 persons. Average rainfall is about 44 inches a year, and Fahrenheit temperatures average 44 degrees in the winter and 77 degrees in the summer. Water supplies seem adequate. The Mulberry River is the primary source of municipal water and water wells serve farms in the County. The major water system in the County is located in the City of Winder in the middle of Barrow County. This city, with a 1970 estimated population of 7,500, provides water to the next four largest communities in the County--south, west and east of Winder. Only minor expansion of water delivery service to be recommended for the larger communities and no recommendations are made for the rural areas and small communities. Only one community under 5,500 population has a municipal sewage treatment system. Providing sewerage systems by 1990 is recommended for three other communities, but no recommendations are made for smaller communities or rural areas. (Poertner)

URBAN SYSTEMS ENGINEERING DEMONSTRATION PROGRAM. VOLUME I: GOALS, OBJECTIVES, AND STANDARDS FOR WATERWORKS, SANITARY SEWERAGE, SOLID WASTE MANAGEMENT, STORM DRAINAGE AND FLOOD PLAIN MANAGEMENT,
Diversified Consultants, Inc., Jackson, Miss.
J. A. Elliot, R. L. Waters, and A. D. Desmarais.
Available from the National Technical Information Service as PB-212 429. Gulf Regional Planning Commission, Gulfport, Mississippi, 1972. 181 p, 27 fig, 15 tab.

Descriptors: *Comprehensive planning, *Sewerage, *Sewers, *Solid wastes, *Flood plains, *Urban drainage, *Water works, Mississippi, Standards, Forecasting, Management, Storm water, Data collection, Surveys.

The Gulf Regional Planning Commission's primary goal, in its Urban Systems Engineering Program, is to establish simultaneous criteria, data and evaluation of existing and future anticipated requirements for (1) water supply, (2) sanitary sewerage, (3) solid waste management, (4) storm drainage, and (5) flood plain management. The four-county region of Hancock, Harrison, Jackson, and Pearl River Counties, Mississippi, will develop both short range and long term development plans to meet the needs of the region, integrating the needs to a realistic frame for financial implementation to provide the most efficient means of system improvement, operation, maintenance and management. Regional development policies will be formulated to: (1) control urban growth, (2) prevent fragmentation and duplication of utility systems, (3) encourage economy of development, (4) prevent the overdesign, underdesign or early obsolescence of public utilities, and (5) generally protect the health, safety and welfare of area residents. Regional development of utilities on the basis on natural instead of political boundaries will be encouraged. General policy statements and discussion of goals, objectives and for each area of concern are covered. (Poertner)
W73-12016

URBAN SYSTEMS ENGINEERING DEMONSTRATION PROGRAM. VOLUME II: AREA-WIDE WATER AND SANITARY SEWERAGE SYSTEMS,
Diversified Consultants, Inc., Jackson, Miss.
J. A. Elliot, R. L. Waters, and A. D. Desmarais.
Available from the National Technical Information Service as PB-212 430, $31.50 in paper copy, $1.45 in microfiche. Gulf Regional Planning Commission, Gulfport, Mississppi, 1972. 590 p, 101 fig, 111 tab.

Descriptors: *Comprehensive planning, *Sewerage, *Sewers, *Water works, *Data collections, Surveys, Mississippi, Water demand, Water supply, Sewage treatment, Forecasting.

Volume II of this four-volume publication presents an inventory of existing and planned waterworks and sanitary sewerage systems in a four-county (Hancock, Harrison, Jackson and Pearl River) region in Mississippi. It is part of a comprehensive study of the present and future water supply, wastewater treatment, solid waste management, storm drainage and flood plain management requirements for the Gulf Regional Planning Commission. The total planning area is about 2,600 square miles with a 1970 population of 268,000 of which 74 percent is urbanized. Total water consumption is 100 mgd. The major source of water supply is ground water. The shallow aquifers are endangered by possible sea water intrusion. Other pollution problems are present as evidenced by action taken by the United States Environmental Protection Agency in classifying some of the area's water as unsatisfactory for interstate use. Industrial complexes are large water users; two such complexes in Jackson County alone account for the consumption of 55 mgd. Water works and sewerage systems presently in use, and others that are foreseen in the area, are described. (Poertner) (See also W73-12016)
W73-12017

TREATMENT OF PHENOLIC AIRCRAFT PAINT STRIPPING WASTEWATER,
Air Force Weapons Lab., Kirtland AFB, N. Mex.
R. H. Kroop.
Available from NTIS, Springfield, Va 22151 as AD-756-925 Price $3.00 printed copy; $1.45 microfiche. Technical Report No AFWL-TR-72-181, January 1973. 98 p, 33 fig, 15 tab, 37 ref, 3 append.

Descriptors: *Waste water treatment, *Phenols, *Paints, *Activated carbon, Industrial wastes, Biochemical oxygen demand.
Identifiers: Paint stripping.

The optimum treatment process for treating large volumes of phenolic paint stripping waste water was determined. Three processes were selected and tested to determine their effectiveness for the removal of the major contaminants in the waste water. These processes were oxidation with ozone, oxidation with potassium permanganate, and adsorption with granular activated carbon. Granular activated carbon adsorption provided the best removal of the organic contaminants and was also the least expensive. Phenol concentration was reduced from 3000 mg/l to less than 2 mg/l in 60 minutes of contact time. The adsorptive capacity for phenols was 0.404 gm phenols/gm of activated carbon and for chemical oxygen demand, 1.79 gm of COD/gm of activated carbon. (Knapp-USGS)
W73-12037

STUDY - WATER AND SEWER FACILITIES - MOBILE COUNTY.
Converse (J. B.) and Co., Inc., Mobile, Ala.

Prepared for South Alabama Regional Planning Commission, June, 1969. 85 p, 13 fig, 12 tab. HUD Ala. P-32 (G).

Descriptors: *Planning, *Water supply, *Sewerage, Projections, Financing, Cooperation, Costs, Alabama.
Identifiers: Inventories, Mobile County (Alabama), Utility system expansion.

Basically a town by town study of water and sanitary sewer facilities in Mobile County, this study focuses on an inventory of existing facilities and their adequacy and on needed expansions to these systems to 1990 and their associated costs. The future expansions are based on population and land use projections of the South Alabama Regional Planning Commission. Also included in the individual studies are tables of specific proposed improvements with their priority and estimated costs and maps showing the location of the systems. The most significant section deals with the city of Mobile. Mobile and its suburbs have been proceeding separately in their expansion programs and it is recommended that there be more cooperation and less duplication of facilities in the metropolitan area. POTOMAC ESTUARY WASTEWATER TREATMENT PLANTS SURVEY.
Environmental Protection Agency, Annapolis, Md. Annapolis Field Office.

1970 Data Report No 27, 1973. 8 p.

Descriptors: *Water quality, *Water analysis, *Potomac River, *Estuaries, *Chemical analysis, Sampling, Analytical techniques, Nutrients, Carbon, Sewage effluents, Pollutant identification, Water pollution sources.
Identifiers: *Potomac estuary.

In order to obtain more information regarding wastewater characteristics, a 24-hour composite effluent sample from 21 Potomac Estuary sewage treatment plants for a 4-day period, April 12-15, 1970, and a 24-hour sample for September 15, 1970, were obtained. Nutrient as well as carbon analyses were made upon delivery of samples to the Annapolis Field Office. Analytical methods and results are presented for the following parameters: total phosphorus, inorganic phosphorus, total Kjeldahl nitrogrn, nitrate + nitrite, ammonia, total organic carbon, and total carbon. (Woodard-USGS)

CONTINUOUS PILOT PLANT STUDY OF RECYCLING OF FILTER BACKWASH WATER,
Calspan Corp., Buffalo, N.Y. Environmental Systems Dept.
L. Wang, P. E. Pallo, B. J. Schwartz, and B. T. Kown.
Journal of the American Water Waters Association, p 355-358, May 1973. 1 fig, 7 tab, 8 ref.

Descriptors: *Waste water treatment, *Water quality control, *Filters, Coagulation, Filtration, Recycling, Water purification, Chemical precipitation, Turbidity, Sludge treatment.

This article summarizes the results of a pilot plant study on the effects of backwash-water recycling on the filter operation and the plant effluent quality. In this type of operation, the wash water is mixed with raw water near the plant intake at a uniform rate. It is then subjected to the same treatment as the raw water--prechlorination, alum coagulation followed by settling and filtration and post chlorination. Under the condition used in the pilot plant operation, the following advantages of the recycling were observed: an increase in the settling rate of the basin sludge, a decrease in filter head loss, a decrease in pollution caused by discharging filter backwash water into a stream, and recovery and reuse of filter backwash water for the water supply. The disadvantage of the system is that the quantity of alum required may have to be increased slightly. In sum, the recycling method described is feasible and promising and warrants further investigation in a real water plant. (McKnight-Florida)

SEWER AND WATER UTILITY REPORT,
Auburn Planning Board, Maine.
R. F. Cahill.
(1973). 10 p, 4 fig.

Descriptors: *Planning, *Sewage, *Water supply, Land use, *Maine.
Identifiers: Utility extensions, Auburn (Maine), Androscoggin River.

A short planning prospectus is presented for water and sewerage system extension for a small city (approximately 25,000). Some background information on the existing systems, the recent push to clean up the Androscoggin River, and the use of Lake Auburn for water supply, and general areas for water and sewer main extensions including additions to outlying industrial areas are discussed. Water main extensions should be limited to areas that will also be served by sewers in order to prevent septic tank problems. A key feature in the expansion of the sewerage system is a new treatment plant being constructed jointly by Auburn and Lewiston, since the construction of a joint facility proved to be more economically feasible than would a separate system for each city. Proposed extension maps are included. (Elfers-North Carolina)
W73-12236

SEWERAGE SYSTEMS REPORT: SOMERSET COUNTY, N.J.
Somerset County Planning Board, N.J.

March, 1972. 71 p, 2 maps, 1 append.

Descriptors: *Sewerage, Treatment facilities, Planning, Coordination, Land use, *New Jersey.
Identifiers: *Somerset County (New Jersey), Inventories, Sewerage authorities, Middlesex County (New Jersey), Raritan River.

An inventory is presented of existing sanitary sewerage facilities in Somerset County; it covers twenty-one cities and townships within the county and three regional sewerage authorities. Each sewerage system in the county is discussed in some detail and various tables are included which cover such features as level of treatment, wastewater flow, types of wastes handled, and length of sewer lines. The county has a long history of providing sanitary sewers and using coordinated systems and planning. This is partly the case because of the great need for wastewater disposal caused by the high levels of urbanization and industrialization in parts of the county. The Somerset County Master Plan for land use calls for large areas of the county to remain in low density development and this will be closely related to the future provision and location of sanitary sewers. Farms, Grasslands, Deserts, Waste water treatment, Irrigation, Sludge, *Sludge disposal, Sanitary engineering.
Identifiers: *Land disposal.

As an alternative to other advanced waste treatment systems, land disposal of treated sewage and sludge shows a great deal of promise. Many municipal, state, and federal agencies are either experimenting with or planning projects for sewage and sludge disposal on forest, cropland, or wasteland. Land disposal is based on the living filter concept--letting nature recycle nutrients and water beneficially on land rather than detrimentally through streams and lakes. Land disposal is characterized by spray irrigation or application of sewage effluent or sludge slurry in predetermined rates and amounts. The key to maximum use of the soil filter is water management and movement. Clogging or standing water will deter the filter and cause runoff. The ability of soil to handle nitrogen is the primary limiting factor for land disposal of sludge; phosphorus is involved as a second limiting factor. Several hydrogeologic factors that must be considered when selecting sites for land disposal are discussed. (USBR)

5E. Ultimate Disposal of Wastes

FINAL DISPOSAL OF EFFLUENT BRINES FROM INLAND DESALTING PLANTS,
Dow Chemical Co., Freeport Tex.
J. R. Booth, Jr., B. P. Shepherd, and W. F. McIlhenny.
Available from the National Technical Information Service as PB-218 432, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water, Research and Development Progress Report No 817, May 1972. 181 p, 37 fig, 13 tab, 40 ref. 14-30-2830.

Descriptors: *Brine disposal, *Desalination, *Deep wells, *Reverse osmosis, Crystallization, Environmental effects, Effluents, *Ultimate disposal.
Identifiers: Disposal methods, Subsurface injection, Site stockpile, Typical sites, Pipeline disposal, Solar ponds.

Methods of final disposal of inland desalination plant effluent brines were investigated. Within legal, ecological and environmental constraints, and using a representative range of brackish water compositions, geographical distribution, geological formations and other such factors, a technical and economic evaluation of all practical methods of final disposal was made using a systems approach. This was illustrated by six case studies. Generalized cost ranges for the component subsystems were prepared for use in approximating systems costs and identifying the least-cost disposal method for use with other specific cases. The study showed that: (1) subsurface injection of waste brines is generally less costly than other methods of final disposal; (2) discharge of waste brines into the sea preceded by pipelining more than 70 miles is not economically sound; (3) electrodialysis is the most economical method of concentrating the effluent brine to 20 percent total dissolved solids at 4.0-MGD product water rate, while solar evaporation is the most economical at the 0.4-MGD rate and solar evaporation is the most economical method of reducing a 20 percent brine to bulk dry solids. THE GREAT MANURE DILEMMA,
J. Gerstner.
The Furrow, p 1-2, September/October, 1970.

Descriptors: *Waste disposal, Waste treatment, Recycling, *Farm wastes, Livestock.

Disposing of animal wastes cheaply and without pollution is fast becoming one of agriculture's knottiest problems. United States livestock produce about two billion tons of liquid and solid wastes per year, enough to fill a square mile 10 feet high every day. Complicating the state of overproduction is the development of cheap commercial fertilizer. The large differences in livestock operations make one ultimate solution to manure handling doubtful, if not impossible. The characteristics of manure change with the type of animal, feed, and climate. The requirements for practical disposal vary with the operation's size, location, and amount of land available. Some methods being developed are: feeding processed manure to livestock, burying effluent, spreading and deodorizing it, and selling it. The animal waste problem is likely to prove less technical than economic. (Wetherill-East Central)
W73-11773

FEED RECYCLING SHOWING PROMISE.
Calf News, Vol 11, No 1, p 28-29, 52, January 1973.

Descriptors: Feed lots, *Farm wastes, *Recycling, *Feeds, Equipment, California, Feeds.

This is a progress report on the Feed Recycling Company, a company selling equipment that takes manure from feedlots and converts it into feeds. The equipment is capable of converting a ton of manure into sugars, fibers, and 400 pounds of protein. Initial cost for the unit is $180,000 and operating costs are five dollars a ton. The end product is worth thirteen cents a pound, which could mean returns up to $600,000 a year for wastes from a feedlot. Feeding tests for the feed are now being run at a California research station. (Marquard-East Central)

SUBSURFACE INDUSTRIAL WASTE WATER INJECTION IN ILLINOIS,
Ohio River Valley Sanitation Commission, Cincinnati. Committee on Subsurface Industrial Waste Water Injection.
D. L. Warner.
Available from NTIS, Springfield, Va 22151 as PB-214 269 Price $3.00 printed copy; $1.45 microfiche. Illinois Institute for Environmental Quality Document No. 72-2, February 1972. 133p, 8 fig, 11 tab, 7 ref, 5 append.

Descriptors: *Waste disposal wells, *Injection wells, *Illinois, Regulation, Legal aspects, Underground waste disposal, Waste water disposal, Industrial wastes.

Five waste-disposal wells have been drilled in Illinois. Four of these are operating. The justification for use of industrial waste water injection is that only limited alternatives are available for certain types of waste waters. The major areas of technologic concern in evaluating the feasibility of waste water injection are the geology and subsurface hydrology of the region and the well site, and the character and volume of the waste water. All of Illinois is underlain by sedimentary rocks, and in much of the State geologic conditions are suitable for waste water injection. The absence of suitable injection horizons in northern Illinois and complex geologic conditions in southern Illinois limit the potential for waste water injection in those areas. The presence of inadequately plugged abandoned oil and gas wells restricts the use of the shallower zones within the Illinois basin. It is recommended that the roles of the various State agencies in regulation of waste water injection be well defined, and a pattern for interagency action is delineated. The Environmental Protection Agency should have the principal regulatory responsibility with the Department of Mines and Minerals, the Geological Survey, the Water Survey, and the Health Department also participating. (Knapp-USGS)

URBAN SYSTEMS ENGINEERING DEMONSTRATION PROGRAM. VOLUME III: AREA-WIDE SOLID WASTE MANAGEMENT,
Diversified Consultants, Inc., Jackson, Miss.
J. A. Elliott, R. L. Waters, and A. D. Desmarais.
Available from the National Technical Information Service as PB-212 431. Gulf Regional Planning Commission, Gulfport, Mississippi, 1972. 253 p, 12 fig, 61 tab.

Descriptors: *Solid wastes, *Comprehensive planning, *Municipal wastes, Regional analysis, Forecasting, Data collections, Surveys.

Solid waste management for the Gulf Regional Planning Commission jurisdiction is reported as part of a comprehensive study of problems of waterworks, sanitary sewerage, solid waste management, storm drainage and flood plain management. Three basic areas of concern are outlined in the study. In this first section an inventory and analysis is made of existing solid waste disposal facilities, evaluated with respect to their ability to serve existing and projected needs. The second section is divided into two sub-sections; the first dealing with the regional concept of solid waste management, the second dealing with guidelines for local management of solid wastes. The third area of concern is a solid waste disposal plan which deals with forecasts of future quantities of solid waste, recommended location and size of proposed landfill areas and a recommended plan of implementation. Four goals recommended for proper handling of solid wastes are: (1) the establishment of regional authorities to handle solid waste management for a short term solution, (2) utilization of state funds to operate regional solid waste management systems for the long term solutions, (3) realignment of the economy and industry to recycle and reuse material resources, and (4) incorporation of reuse and recycling into the initial design of products. These goals should be implemented on a national level as well as on the local level. (Poertner) (See also W73-12016)

SURVEY OF INDUSTRIAL WASTE INJECTION WELLS: VOLUME I,
Missouri Univ., Rolla. Dept. of Geological Engineering.
D. L. Warner.
Available from NTIS, Springfield, Va. 22151 as AD-756 641, Price $9.00 printed copy; $1.45 microfiche. Final Technical Report, June 1972. 675 p. USGS 14-01-001-12280.

Descriptors: *Waste disposal wells, *Disposal, *Injection wells, Alabama, California, Colorado, Florida, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Industrial wastes.

This report consists of 246 forms describing individual wastewater injection wells that have been inventoried. A table lists the 22 states in which wells are known to exist and the number of wells inventoried. The forms are grouped by state and arranged approximately chronologically within each state. All wells that have been constructed for injection of industrial wastewaters into saline water aquifers were included. In addition to operative wells, some of the wells in the survey have never been operated; others have been operated, but are now inactive or abandoned. Oilfield brine injection wells are not included, nor are wells used exclusively for injection of sewage effluent. Volume 1 contains information for Alabama, California, Colorado, Florida, Illinois, Indiana, Iowa, Kansas, Kentucky, and Louisiana. (Knapp-USGS)

DISPOSITION OF SPOIL ON THE DUMP SITE,
Rhode Island Univ., Kingston.
S. B. Saila, and S. D. Pratt.
In: Dredge Spoil Disposal in Rhode Island Sound, Rhode Island University Marine Technical Report No 2, Kingston, p 7-14, 1972. 18 fig.

Descriptors: *Dredging, *Desilting, *Waste disposal, *Sounds, *Bathymetry, Contrours, Sediment distribution, Distributions patterns, Sediment transport, Channel improvement, Navigation, Estuaries.
Identifiers: *Rhode Island Sound, Providence River (R I), Dredging spoils.

Between December 1967 and September 1970 a total of 8.2 million cubic yards of dredge spoil from the Providence River was deposited on an offshore site in Rhode Island Sound. In October 1970 divers made direct observations of topographic features, animal life, and sediment variability in the area of active dumping in order to obtain information to properly interpret bathymetric records and grab samples from the area. Within the limits of the precision of bathymetric surveys, the volume of spoil on the disposal area was the same as that reported dumped; no large-scale loss had taken place during or after the dumping operation. The presence of a layer of incohesive silt/clay on the spoil surface during the summer indicated a nonerosive physical environment during that period. The combined effect of dumping pattern, sediment properties, and hydrographic variables has produced a low cone of spoil approximately 1 mile in diameter, indicating that the 1-square-mile assigned dumping area was of adequate size. (See also W73-09142) (Woodard-USGS)

SEDIMENTS OF THE DREDGING AND DISPOSAL AREAS,
Rhode Island Univ., Kingston.
S. D. Pratt.
In: Dredge Spoil Disposal in Rhode Island Sound, Rhode Island University Marine Technical Report No 2, Kingston, p 15-18, 1972. 2 fig.

Descriptors: *Dredging, *Desilting, *Waste disposal, *Sediment distribution, *Sounds, Sediment transport, Correlation analysis, Sediments, Shellfish, Channel improvement, Navigation, Estuaries.
Identifiers: *Rhode Island Sound, Providence River (R I), Dredging spoils.

Between December 1967 and September 1970 a total of 8.2 million cubic yards of dredge spoil from the Providence River was deposited on an offshore site in Rhode Island Sound. The sediments encountered in this study are described to provide a basis for distinguishing spoil materials from natural sediments, predicting the stability of the spoil under the hydrographic conditions of Rhode Island Sound, and studying animal-sediment relationships. Although much of the spoil had a smaller median-grain size and a higher percentage of organic matter than the natural sediments in the dumping area, these were not always distinguising characteristics. Poor sorting and the presence of the shells of estuarine mollusks were more reliable indicators. The presence of clay, pebbles, plant detritus, oil globules, and gray or black color also identified spoil. (See also W73-09142) (Woodard-USGS)
W73-12319

CHARACTERISTICS OF THE PHYSICAL ENVIRONMENT,
Rhode Island Univ., Kingston.
T. T. Polgar.
In: Dredge Spoil Disposal in Rhode Island Sound, Rhode Island University Marine Technical Report No 2, Kingston, p 19-26, 1972. 5 fig.

Descriptors: *Dredging, *Desilting, *Waste disposal, *Sounds, *Sediment distribution, Currents (Water), Sediment transport, Distribution patterns, Seasonal, Measurement, Current meters, Data collections, Beaches, Channel improvement, Estuaries.
Identifiers: *Rhode Island Sound, Providence River (R I), Dredging spoils.

Between December 1967 and September 1970 a total of 8.2 million cubic yards of dredge spoil from the Providence River was deposited on an offshore site in Rhode Island Sound. Examination of the current and wave regimes of the physical environment in the dump site area provides some useful conclusions regarding the disposition of dumped sediments. Currents in the dump site region are dominated by the semi-diurnal tide. Instantaneous bottom currents rarely exceed 0.3 knots, whereas the net tidal transport velocity is no greater than 0.1 knots. Currents alone are not effective in resuspending sediments. During a significant portion of the year waves in the area could develop bottom velocities sufficient for the resuspension (erosion) of unconsolidated sediments. The mode of deposition and mechanical characteristics of dredged materials apparently results in an erosion-resistant deposition. The dumped material cannot be considered unconsolidated, and theoretical predictions based on the behavior of unconsolidated sediments are not applicable. Beaches in the region will probably remain free of dredge spoil traces from the dump site. (See also W73-09142) (Woodard-USGS)

METHOD OF PURIFYING WATER,
Aktiebolaget Atomenergi, Stockholm (Sweden). (assignee)
S. H. Ahrland, B. G. F. Carleson, and J. S. Lindhe.
U.S. Patent No. 3,730,886, 3 p, 2 ref; Official Gazette of the United States Patent Office, Vol 910, No 1, p 290, May 1, 1973.

Descriptors: *Patents, *Water purification, *Phosphates, Zirconium, *Water treatment, Cooling water, Nuclear reactors.

The primary object is to effect a method of purifying water which can be used for water having a high temperature and which results in water having an extremely low percentage of foreign anions and cations and having a pH value near 8, preferably 6 - 8. The water is treated with zirconium phosphate and then with zirconium hydroxide which removes the phosphate ions. The hydroxide is precipitated with ammonia and the precipitated zirconium hydroxide is then treated with a water solution of ammonia. (Sinha-OEIS)

WATER PURIFICATION,
Texaco, Inc., New York. (assignee)
H. V. Hess, and F. E. Guptill, Jr.
U.S. Patent No 3,731,801, 4 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 535, May 8, 1973.

Descriptors: *Patents, *Demineralization, *Water purification, *Water treatment, Brackish water, Sea water, *Desalination, Scaling, Corrosion, Minerals, Hardness (Water), *Water quality control.

Mineral constituents whose solubility varies inversely with temperature are removed. The water temperature is raised by direct contact with a preheated stream of liquid hydrocarbon oil to a temperature which is sufficient to precipitate the minerals but below the temperature at which the hot oil will extract water, and at a pressure sufficient to keep the oil and water in the liquid phase. The precipitated minerals may be mechanically separated. The oil and water phases separate in one decanter, and the minerals tend to settle as a gelatinous floc at the bottom of the decanter from which the floc may be drawn off. In a second decanter, separation of oil and water again takes place and the remaining minerals settle to the bottom. When the minerals and oil have been removed, the purified water is ready for use. ENTOMOLOGICAL SPECIAL STUDY NO. 44--013-72/73, LABORATORY EVALUATION OF RESIDUES MAINTAINED IN WATER TREATED WITH POLYETHYLENE FORMULATIONS OF CHLORPYRIFOS, DECEMBER 1971-APRIL 1972,
Army Environmental Hygiene Agency, Edgewood Arsenal, Md.
M. A. Lawson.
Available from NTIS, Springfield, Va. 22151, as AD-755 517, Price $3.00 printed copy; $1.45 microfiche. Report, 1972. 10 p, 4 fig, 3 ref, 2 append.

Descriptors: *Water pollution control, *Pesticides, *Water chemistry, *Chemical reactions, Laboratory tests, Pesticide residues, Plastics, Water treatment, Entomology, Insect control.
Identifiers: *Chlorpyrifos, Chlorinated polyethylene.

Laboratory evaluations were conducted for 16 weeks to compare, under static conditions, residue levels maintained in water treated with three chlorinated polyethylene pellet formulations of chlorpyrifos (0,0-diethyl 0- (3,5,6-trichloro-2-pyridyl) phosphorothioate). All pellets were cylindrical in shape and had a specific gravity > 1.0. Each formulation was evaluated at dosages of 0.25, 0.5 ppm in one gallon glass jars containing three liters of distilled water. Treatments and controls were replicated three times. Water samples were removed from the jars weekly, partitioned with hexane, and subjected to electron capture gas chromatographic analysis to determine chlorpyrifos residues. Data were subjected to three-way analysis of variance to determine effects of formulation, dosage, week after treatment, and the interactions thereof, on residues maintained in the water. Peak residue levels occurred within seven to ten weeks after treatment for all formulations at each dosage. A gradually decreasing trend in residues began after ten weeks for all formulations. Higher dosages resulted in significantly higher residue levels during each week of the study. There were no significant differences among the three formulations in the amount of residues maintained in the water during the 16-week test. (Woodard-USGS)

VIRUS IN WATER: II. EVALUATION OF MEMBRANE CARTRIDGE FILTERS FOR RECOVERING LOW MULTIPLICITIES OF POLIOVIRUS FROM WATER,
Gulf Coast Water Hygiene Lab., Dauphin Island, Ala.
W. F. Hill, Jr., E. W. Akin, W. H. Benton, and T. G. Metcalf.
Appl Microbiol. Vol 23, No 5, p 880-888. 1972. Illus.
Identifiers: *Filters (Membrane cartridge), Multiplicities, *Poliovirus, Virus, *Water treatment.

The efficiency of a Millitube MF cartridge filter, a membrane filter, for recovery of poliovirus from 100-gal volumes of both fresh (tap) and estuarine water was determined. In the high multiplicity of virus input-output experiments, recovery of 97% or greater of input virus was achieved in both types of water when the final concentration of divalent cation as Mg2+ was 1200 microgram/ml and the pH was 4.5. Virus was effectively eluted from the membrane cartridge with 5 times nutrient broth in 0.05 M carbonate-bicarbonate buffer at pH 9.0. Four elutions of 250 ml each were used. In the low multiplicity of virus input-output experiments under the same cationic and pH conditions, up to 67% of the input virus was recovered when the virus was further concentrated from the eluates by the aqueous polymer 2-phase separation technique. The volume reduction was 126,000-190,000 to 1. The use of the combined techniques, i.e., membrane adsorption followed by aqueous polymer 2-phase separation, provided a highly sensitive, simple, and remarkably reliable sequential methodology for the quantitative recovery of poliovirus occurring at multiplicities as low as 1 to 2 plaque-forming units/5 gal of water.--Copyright 1972, Biological Abstracts, Inc.
W73-12187

PREVENTING FILAMENTOUS SCALE IN WELL WATER,
Sayreville Water Works, N.J.
A. Piatek.
Water and Wastes Engineering, Vol 4, No 12, p 54-55, December 1967, 9 ref.

Descriptors: *Water treatment, *Groundwater, *Iron bacteria, *Wells, *Corrosion, Phosphates.
Identifiers: Pumping efficiency, Sulfamic acid.

Growths of iron bacteria plugged an 8-in. line and well casings. A system of chemical treatment has been found effective in preventing the formation of filamentous scale and also apparently reducing the level of corrosion. The well is surged with a solution of calgon (100 lb. per 50 gal. of water); then 5 lb of HTH (calcium hypochlorite) (dissolved in 5 gal. water) is added, and surged to mix. 15 gal Anthium Dioxcide (Chlorine dioxide) is added, the total mixture is surged for 2 hrs. (15 min. on and 15 min. off), then allowed to stand overnight. The well content is pumped into the 3,000-ft. 8-in.-diameter line to the treatment plant then (after standing overnight) flushed back to waste. An inhibited sulfamic acid is introduced to the well and another backflush is performed. Treatment every two months is required to maintain pumping efficiency. (Bean-AWWARF)
W73-12188

CONTINUOUS ION EXCHANGE SOFTENING,
Permutit Co., Paramus, N.J.
G. Alexander.
Water and Wastes Engineering, Vol 6, No 1, p 28-29, January 1969. 2 fig.

Descriptors: *Water treatment, Water quality, *Water softening, Hardness (Water), *Ion exchange, *Resins.
Identifiers: *Countercurrent ion exchange.

Continuous countercurrent ion exchange for water softening is applicable to both water and waste water treatment. The equipment in the system has been developed to provide efficient and simple operation in softening municipal water supplies. The Permutit CCIX system for this application is described. During the softening cycle, the raw water flows upward and the resin moves downward in a countercurrent direction. When the water and the resin are in contact, magnesium and calcium ions are exchanged for sodium ions on the resin. Normally when the resin becomes partially exhausted it does not remove all the calcium and magnesium ions and there is a leakage of some hardness through the resin. In the continuous countercurrent system, however, the last resin to contact the water is always the most completely regenerated; therefore minimum leakage occurs. Removal of exhausted resin from the bottom of the vessel and replacement with fully regenerated resin at the top maintains this highly efficient softening cycle. (Bean-AWWARF)

ADSORPTION AND FILTRATION WITH GRANULAR ACTIVATED CARBON,
Calgon Corp., Pittsburgh, Pa.
D. G. Hager.
Water and Wastes Engineering, Vol 6, No 8, p 39-43, August 1969. 6 fig, 2 tab, 7 ref.

Descriptors: *Water treatment, *Activated carbon, Efficiencies, Adsorption, Filtration, Performance, Carbon filters.
Identifiers: *Carbon reactivation.

Granular activated carbon beds, coupled with periodic reactivation of the carbon, offer removal efficiency with both theoretical and practical advantages. In the treatment of water and wastes, granular carbon demonstrates utility for simultaneous adsorption, filtration, and removal of excess oxidants. The application of granular activated carbon to potable water treatment is described and performance results in municipal water installations in England, Germany and the United States are reviewed. METROPOLITAN WATER INTELLIGENCE SYSTEMS - COMPLETION REPORT, PHASE II,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
N. S. Grigg, J. W. Labadie, G. L. Smith, D. W. Hill, and B. H. Bradford.
Available from the National Technical Information Service as PB-221 992, $6.00 in paper copy, $1.45 in microfiche. Water Resource Systems Program Completion Report, June 1973, 155 p, 20 fig, 61 ref, 1 append. OWRR-C-3105 (No 3685) (1). 14-31-0001-3685.

Descriptors: *Control systems, *Sewers, *Storm runoff, *Overflow, *Optimization, Water pollution control, Storage, Reservoir operation, Mathematical models, Dynamic programming, Automatic control, *Combined sewers.
Identifiers: *Mathematical programming, Optimal control theory, Control logic.

The results of Phase II of the project 'Metropolitan Water Intelligence Systems' (MWIS) are reported. The special type of MWIS considered is the fully automated control system for combined sewer systems. Technical data are presented on computer and control equipment, on the formulation, on the control strategy problem and on optimization techniques for developing control logic. The Real-Time Automation and Control System (RTACS) Model is presented as a simulation model which can be used off-line to develop control logic. The hydrologic, hydraulic and control models needed in either an RTACS or an RTACS Model are discussed. The socio-political problems associated with implementing a MWIS are related to similar problems experienced in implementing any information system or automation effort. The problems facing local decision makers who must comply with shifting standards under heavy time, technological, financial and political constraints are related to their personal objectives. Proposals are advanced for social modeling techniques which could help in MWIS implementation.

REGISTRATION IS REQUIRED AS GOVERNMENT MOVES TO CONTROL WATER POLLUTION FROM LARGE FEEDLOTS,
J. Richter.
Beef, p 20. July, 1971.

Descriptors: *Feed lots, *Waste disposal, Farm wastes, Legal aspects, Water pollution control.
Identifiers: *Registration.

As of July 1, 1971, feedlots with over 1,000 head must apply for permits to discharge effluents into waterways. Smaller units, those that don't discharge from a single point source, or those that are in states of tougher control do not have to register. Agencies involved are the EPA and the Army Corp of Engineers working with the Refuse Act of 1899. (Marquard-East Central)
W73-11786

ENGINEER SAYS FEEDERS CAN HANDLE MOST POLLUTION CONTROL PRACTICES.

Beef, p 15. July, 1971.

Descriptors: *Feed lots, Runoff, *Farm wastes, Water pollution control, Nebraska.

75% of feedlot pollution problems can be controlled by the individual. Small operators can receive help from the Soil Conservation Service while large operators must go to engineers to solve the other 25%. Nine suggestions are offered for control of runoff. (Marquard-East Central)
W73-11788

EROSION PREVENTION DURING HIGHWAY CONSTRUCTION BY THE USE OF SPRAYED ON CHEMICALS,
Virginia Highway Research Council, Charlottesville.
D. C. Wyant, W. C. Sherwood, and H. N. Walker.
Available from NTIS, Springfield, Va 22151 as PB-213 207, Price $3.00 printed copy, $1.45 microfiche. Report 72-R1, July 31, 1972. 37 p, 4 fig, 11 plate, 15 tab, 18 ref, append.

Descriptors: *Erosion control, *Bank protection, *Coatings, *Roadbanks, Virginia, Soil erosion, Slope protection, Coal tar coatings, Plastics.

The erosion inhibiting potential of nine commercial plastic chemicals was evaluated. All chemicals were also compared with the conventional method of straw tacked with an asphalt emulsion, and with untreated soil. In Virginia there are three principal physiographic provinces. The soils in each province are significantly different in composition and erodibility. In each area two highway slopes with a vertical height of 15 to 20 feet and a slope of approximately 2:1 were selected to be tested. The same chemicals were not the most effective in all areas. Also, no chemical performed better than the conventional method in any area. Some of the chemicals in some soils even promoted erosion. In the Ridge and Valley physiographic province, Petroset SB and Soil Gard were the most effective. For the soils in the Piedmont physiographic province, none of the chemicals performed well. In the sandy soils of the Coastal Plain physiographic province, Petroset SB and straight asphalt emulsion were very effective. Both are more expensive than, but about equal in effectiveness to, the conventional straw-asphalt method. (Knapp-USGS)

C. Damberger.
U.S. Patent No 3,726,406, 4 p, 9 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 909, No 2, p 593, April 10, 1973.

Descriptors: *Patents, Skimming, Equipment, *Oil spills, *Oil pollution, *Pollution abatement, *Water quality control, *Water pollution control.
Identifiers: Oil booms, *Water pollution prevention.

The oil slick is drawn into the skimmer by a cable water fence gathered by boat equipment and drawn toward the skimmer body. The fence is made up of a series of floatable blocks that connect by pin opening and locking devices. The skimmer may be a hopper or funnel shaped body closed at its bottom end and open at its top. Hot water is directed against the underside of the oil slick to make the oil pass more readily over a float and into the skimmer body. The hot water hose is connected to a vacuum pump. The heated oily water is delivered to a separator from which the separated oil is moved to a storage tank. The apparatus may be adapted for use about an oil derrick or oil tanker to contain lost oil. (Sinha-OEIS)
W73-11873

METHOD AND APPARATUS FOR SEPARATING WATER FROM A MIXTURE OF A GRANULAR MATERIAL AND WATER,
Maschinenfabrik Buackau R. Wolf A.G., Munich (West Germany). (assignee)
K. Pause, and H. Buzga.
U.S. Patent No 3,730,343, 7 p, 4 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 910, No 1, p 161, May 1, 1973.

Descriptors: *Patents, *Water treatment, *Centrifugation, Granules, *Evaporation, Equipment, Separation techniques, *Water quality control.
Identifiers: Centrifuges.

A centrifuge is described for separating water from a mixture of granular material and water. Water not retained by the granular material is separated by flowing through a screen by the action of gravity. Within the centrifuge there are zigzag-shaped radial channels and slanted screens. Water which adheres to the granular material is evaporated by streams of air blowing into the outer end of the zigzag-shaped channel and into a discharge duct for transporting the granular material while evaporation of remaining water continues. (Sinha-OEIS)
W73-11875

SKIMMING SYSTEM,
C. H. Prewitt.
U.S. Patent No 3,730,346, 5 p, 10 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 910, No 1, p 162, May 1, 1973.

Descriptors: *Patents, *Oil pollution, *Oil spills, Skimming, *Pollution abatement, *Water pollution control, *Water quality control, Separation techniques, Equipment.
Identifiers: *Water pollution prevention.

This system consists of an oil skimming unit, which is self-propelled but tethered to the mother craft, and has flexible conduits to transfer fluid to the mother craft where it is separated. The skimmer has an elongated trough extending laterally of the path along which the unit is propelled. The trough has forward and aft horizontal edges lying in the same horizontal plane to avoid creating a bow wave condition and allow the floating fluid to be drawn into the trough across both foreward and aft edges. A submersible pump coupled to the skimming unit permits the conduct of fluid to the mother craft by positive pressure rather than suction. The output of the pump is controlled. An automatic adjustment of fluid volume prevents the unit from floating too high or sinking too low by virtue of the weight of the fluid contained in the trough supplementing the pumping rate adjustment. (Sinha-OEIS)
W73-11876

OIL CONTAINMENT BOOM,
Reynolds Submarine Services Corp., Miami, Fla. (assignee)
A. L. Markel, and J. R. R. Harter.
U. S. Patent No 3,731,491, 3 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 455, May 8, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution control, *Water quality control, Equipment, *Pollution abatement.
Identifiers: Oil containment, *Water pollution prevention.

An oil containment boom is formed into an elongated strip of corrugated metal by securing together sections of corrugated sheet metal in end-to-end fashion. The corrugations in the aluminum sheet material are oriented vertically to provide floating flexibility in both the vertical and horizontal planes. Weights may be attached to the corrugated metal strip to vary the freeboard height of the floating boom. For use in rough sea conditions, small light weight stabilizer or outrigger floats may be bolted to the boom to provide further reserve flotation and a righting moment arm to each side of the boom. The stabilizer or outrigger floats may attached at regular intervals such as 6 foot intervals. (Sinha-OEIS)
W73-11882

METHOD FOR REMOVING OIL AND DEBRIS FROM WATER,
Standard Oil Co., Chicago, Ill. (assignee)
J. F. Grutsch, and R. C. Mallatt.
U.S. Patent No 3,732,161, 2 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 621, May 8, 1973.

Descriptors: *Patents, *Flotsam, *Oil spill, *Oil pollution, Equipment, *Filtration, *Pollution abatement, Filters, *Water quality control, *Water pollution control, Slime.
Identifiers: Polyurethane, *Water pollution prevention.

Buckets are attached to an endless chain which moves through a closed loop path. The buckets catch debris and as they rise on the loop they dump the debris or oil into a holding bin. The endless chain is made up a series of interconnected foraminous chambers holding a regenerable porous filter material such as polyurethane. Preferably the filter material will have an outer large pore section and an inner small pore section. As the chain moves the filter material absorbs surface and subsurface oil from the water passing through the filter material. The filter material is regenerated by squeezing the filter material to release the oil into a container or holding bin. (Sinha-OEIS)
W73-11886

METHOD OF REMOVING OIL SPILLS FROM WATER,
Texaco, Inc., New York. (assignee)
F. C. McCoy, H. V. Hess, and R. L. Sung.
U.S. Patent No 3,732,162, 3 p, 1 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 622, May 8, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Asphalt, *Coagulation, *Pollution abatement, *Water quality control, *Water pollution control.
Identifiers: Petroleum wax.

A coagulant such as asphalt having a melting point above about 250F, and mixtures of asphalt and petroleum waxes with hydrophilic anticaking agents are used to absorb oil floating on water. The coagulant may be sprayed while in the molten state onto the oil spill where it will solidify and flux with the oil. The resulting semi-solid mass which has a lesser density than water will float until removed. (Sinha-OEIS)
W73-11891

FLOATING DEBRIS RECOVERY APPARATUS,
R. R. Tipton.
U.S. Patent No 3,731,813, 4 p, 12 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 910, No 2, p 538, May 8, 1973.

Descriptors: *Patents, Flotsam, *Oil spills, *Oil pollution, Skimming, Equipment, *Pollution abatement, *Water quality control, *Water pollution control.

A marine vessel is equipped with a holding basin into which flotsam or oil is moved by a rotating skimmer with a floating wier along the edge of the basin used to separate the floating liquid debris from the surface of the water and allow it to flow into a collection tank. A conveyor is used to remove the solid debris from the holding basin. (Sinha-OEIS)

THE PROBLEM OF PHOSPHORUS IN NEW YORK'S WATERS.
New York State Dept. of Environmental Conservation, Albany.

February 1973. 23 p, 28 ref.

Descriptors: *Phosphates, *Water pollution sources, *Eutrophication, *Detergents, *New York, Legislation, Water pollution, Municipal wastes, Sewage treatment, Waste water treatment, Nutrients, Nutrient removal, Reviews.

A major cause of accelerated eutrophication of lakes in New York State is the enrichment of lake water with phosphorus from detergents. Studies have shown household detergents to be the source of about half of the phosphorus content in municipal waste water discharges. Recognizing this problem, the New York State Legislature adopted laws to limit the phosphate content of household cleaning products to 8.7 percent by January 1, 1972 and to trace levels by June 1, 1973. It is also the policy of the State to reduce phosphorus in waste water discharges through the use of tertiary sewage treatment, because this will remove the phosphates contributed by detergents and other sources as well. However, implementation of tertiary treatment will take a minimum of ten years, and many lake communities do not have sewers or central treatment plants. The banning of phosphates causes problems, however. Flame-retardent fabric often loses its ability to remain fire-resistant when washed in low phosphate or no-phosphate detergent. Further research into other methods of fire proofing should eventually result in fire-treatment methods that are not adversely affected by phosphate-free detergents. Dishwasher detergents, which constitute only 3 percent of all phosphate in detergents, are presently ineffective without phosphates. Substitutes for phosphates can also be toxic to humans and need to be studied before put into wide use. Modifications may be needed in New York State law to cope with these difficulties. A survey found that 15 states and 54 cities and counties have taken legislative action to cope with detergent phosphates. (Poertner)

MISSOURI WATER QUALITY STANDARDS SUMMARY.
Missouri Clean Water Commission, Jefferson City.

Available from NTIS, Springfield, Va 22151 as PB-214 087, Price $3.00 printed copy; $1.45 microfiche. Environmental Protection Agency--Missouri Clean Water Commission Publication, May 1972. 39 p, 7 fig.

Descriptors: *Water quality standards, *Missouri, *Water pollution control, *Interstate rivers, *Water Quality Act, Pollution abatement, Water quality control, Regulation, Waste disposal, Industrial wastes, Municipal wastes.

In the Water Quality Act of 1965, Congress authorized the establishment of water quality standards for interstate (including coastal) waters. Water quality standards approved by both the Federal Government and the State of Missouri are presented. The standards consist of three major components: designation of the uses which interstate waters are to serve, specification of narrative and numerical criteria to protect and enhance water quality, and specification of a plan of implementation and enforcement, which includes treatment and control requirements for municipal, industrial and other wastes discharged to or affecting interstate waters. The standards are enforceable under the State water pollution control statutes and the Federal Water Pollution Control Act. (Woodard-USGS)
W73-12034

WATER SUPPLY AND SEWERAGE PLANNING IN CENTRAL MERRIMACK VALLEY REGION: PHASE ONE.
Metcalf and Eddy, Inc., Boston, Mass.

Prepared for Central Merrimack Valley Regional Planning District, September 1970. 32 p, 1 fig, 6 tab, 1 append. HUD Mass. P-67.

Descriptors: *Planning, *Water supply, *Sewerage, Pollution abatement, Massachusetts.
Identifiers: *Merrimack River Basin, Utility systems expansion, Inventories, Lawrence (Mass), Newbury (Mass), West Newbury (Mass), Newburyport (Mass), Andover (Mass), Methuen (Mass), North Andover (Mass).

This very general planning study of water supply and sewerage needs for fifteen cities and towns in the Central Merrimack Valley is oriented toward describing planning situations and strategies rather than specific projects. The three basic parts of the report are (1) a discussion of the use of the streams in the Merrimack basin for both water supply and wastewater disposal; (2) a water supply systems inventory and planning strategy; and (3) a sewerage systems inventory and planning strategy. With regard to water supply the cities tend to fall into three categories: those where the future supply is reaching a critical stage, e.g. Lawrence and Newburyport; those with adequate supplies and possible responsibilities to supply neighboring urban areas; and those that can rely on local

groundwater supplies. In relation to sewerage, four cities are planning a sub-regional treatment plant and interceptor sewer system, four others are under state orders to improve their level of wastewater treatment, and the remaining urban areas have no treatment. (Elfers-North Carolina)

WATER SUPPLY VOLUME OF TECHNICAL APPENDIX FOR REGIONAL UTILITIES STUDY.
Minges (James S.) and Associates, Inc., Farmington, Conn.

Prepared for Capitol Region Planning Agency, Hartford, Connecticut, 1969. 140 p, 9 fig, 6 maps, 27 ref, glossary. UPA-CONN. P-78 (G).

Descriptors: *Water supply, *Water supply development, *Water demand, *Water management (Applied), Planning, Groundwater, Surface Water Availability, Projections, Land use, Connecticut.
Identifiers: Service areas, Hartford (Connecticut), Water compensation requirements.

This appendix contains the detailed background data related to water supply and used to formulate plans and programs presented in the Regional Utilities Study. Basically a working document, it serves to illustrate the planning process involved in the formulation of the final water supply plans for the metropolitan area of Hartford, Connecticut. The data and planning information fall under several categories: (1) background data on population, land use, and planning procedures; (2) water supply inventory data such as existing sources of water, existing supply systems, and water quality analysis; (3) the future demand for water by service areas; (4) alternative water supply plan elements such as groundwater and surface water sources; and (5) program elements for implementation including staging and costs. THE TECHNOLOGY OF SOLID WASTE MANAGEMENT--IMPLICATIONS FOR STATE POLICY.
California Assembly General Research Committee, Sacramento. Assembly Science and Technology Advisory Council.

Available from National Technical Information Service, U.S. Dep't. of Commerce, as PB-205 240. July 1971. 38 p, 1 fig.

Descriptors: *Solid wastes, *California, *Environmental effects, *Waste treatment, *Waste disposal, Water quality control, Disposal, Reasonable use, Governments, Comprehensive planning, Recycling, Landfills.

This panel on Solid Waste Management was charged with the task of reviewing present technological issues and with identifying constraints and opportunities for improved methods of solid waste disposal in California. The panel clarified the objectives of improved solid waste practices in California and outlined an expanded role for state government in the field of solid waste management. The major contribution is emphasis on the need for a systems approach to solid waste management and an examination of economic and social factors which are of fundamental importance in the application of improved technology. Many of the recommendations set forth general directions for state policy and action. Three major areas of concern in the management of solid waste are environmental degradation resulting from waste disposal and extraction of raw materials, accelerating costs to local government for waste handling and disposal, and resource depletion as non-renewable resources are discarded as waste and lost for future use. (Mockler-Florida)
W73-12193

REGULATION RELATING TO MONITORING AND REPORTING WASTEWATER DISCHARGES AND THEIR EFFECT UPON RECEIVING WATERS.
North Carolina Dept. of Natural and Economic Resources, Raleigh.

1973. 40 P.

Descriptors: *North Carolina, *Waste disposal, *Waste identification, *Water pollution sources, Legislation, Water pollution control, Waste treatment, Environmental sanitation, Regulation, Monitoring, Sewage effluents, Treatment facilities, Waste treatment, Sampling, Influent streams, Effluents, Permits.
Identifiers: *Administrative regulations.

This is a proposed regulation relating to monitoring and reporting of wastewater discharges and their effect upon receiving waters by the North Carolina Board of Waters and Air Resources. The regulation provides that the owner or person in charge of every water pollution control facility which receives a wastewater influent from more than one source shall report to the Department the name of every industrial establishment contributing wastes containing toxic materials. Every person subject to the regulation shall be required to maintain an approved monitoring system. In addition, biological monitoring may be required when necessary to determine whether uses of larger bodies of water are being or will be impaired by discharges sufficient in volume or character, to adversely affect the natural biota of the water involved. Penalties for violation of the regulation are provided and the regulation contains a severability clause. Charts, graphs, and applicable definitions are included. All applications for permits shall be accompanied by a proposal for a complying monitoring and reporting system. (Mockler-Florida)

REPORT ON PUBLIC HEARINGS ON THE ADOPTION OF PROPOSED REGULATIONS FOR THE PURPOSE OF IMPLEMENTING THE WATER AND AIR QUALITY REPORTING ACT OF 1971.
North Carolina Dept. of Natural and Economic Resources, Raleigh.

Board of Water and Air Resources Report, February 1, 1973. 247 p.

Descriptors: *North Carolina, *Legislation, *Monitoring, *Water quality control, *Pollutant identification, Pollution abatement, Water pollution sources, Law enforcement, Air pollution, Water pollution control, Wastes, Waste identification, Waste water (Pollution), Water conservation, Legal aspects.
Identifiers: *North Carolina Water and Air Quality Reporting Act of 1971, Administrative regulations.

The purpose of the hearing was to allow the public an opportunity to express its views on proposed regulations implementing the North Carolina Water and Air Quality Reporting Act of 1971. The Act requires first, the filing of reports with the Board of Water and Air Resources covering the discharge of wastes and air contaminants to the waters and outdoor atmosphere and second, the establishing and maintaining of approved systems for monitoring the quantity and quality of such discharges and their effects upon the air and water resources of the state. Statements were made by interested individuals, corporations, municipalities and governmental agencies. (Reed-Florida)

SAFE DRINKING WATER.

Supp. Hearings--Subcomm. on Public Health and Environment--Comm. on Interstate and Foreign Commerce, U.S. House of Representatives. 92d Cong, 2d Sess, June 7, 8, 1972. 198 p, 1 chart.

Descriptors: *Legislation, *Water supply, *Public health, *Potable waters, Water sources, Environmental sanitation, Water treatment, Water purification, Domestic water, Water quality, Groundwater resources, Underground waste disposal, Governmental interrelations, Water quality standards.
Identifiers: *Congressional hearings, Administrative regulations.

H.R. 14899 would amend the Public Health Service Act and the Federal Food, Drug, and

Cosmetic Act to assure that the public is provided with safe drinking water. This legislation would provide for the establishment by the federal government of certain standards pertaining to drinking water and its sources as well as federal assistance to state agencies and other authorities for development of improved methods for the treatment and purification of water. A requirement that federal standards be developed for recreational waters was deleted from the proposal. The proposal requires development by states of programs which contain minimum requirements to control underground injection of waste which may result in the contamination of a source of drinking water. Primary responsibility for the development and operation of the program is placed on the state and only if a state fails to develop and enforce its own program will the federal government step in. Currently, few states regulate the quality of underground waters; thus, this bill would plug a potential loophole by regulating underground waste disposal. (Mockler-Florida)

CIVIL LIABILITY FOR OIL POLLUTION,
A. Black.
Houston Law Review, Vol 10, No 2, p 394-425, January 1973. 201 ref.

Descriptors: *Oil pollution, *Water Quality Act, *International law, *Oceans, *Treaties, Water quality standards, Legal aspects, Liability, Water pollution sources, Oil wastes, Oil spills, Economics, United Nations, Governmental interrelations, Law of the sea, International commission.
Identifiers: Absolute liability.

Recent efforts to cope with the burgeoning contamination of the world's seas and shores from oil are examined. The historical background of international treaties relating to oil pollution is discussed. Two United Nations treaties dealing with civil liability and recovery for oil pollution damage are analyzed. The treaties are compared with related provisions of the Water Quality Improvement Act of 1970, a recent federal response to the need for environmental protection. Reconcilation of conflicting provisions of the treaties and the federal statute is recommended so that they will operate harmoniously and effectively. The United States should establish a revolving fund composed of the contributions of those who receive oil in order to meet more fairly and efficiently the need for additional compensation for oil pollution damage. It is emphasized that oil pollution of the seas represents an urgent concern of the international community. (Mockler-Florida)
W73-12213

THE FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972: EFFECTIVE CONTROLS AT LAST,
J. Lipman.
Brooklyn Law Review, Vol 39, No 2, p 403-425, Fall 1972. 187 ref.

Descriptors: *Rivers and Harbors Act, *Permits, *Legislation, *Water pollution control, *Federal Water Pollution Control Act, Legal aspects, Water quality standards, Waste treatment, Water pollution treatment, Water pollution sources, Governmental interrelations, State jurisdiction, Penalties (Legal), Judicial decisions.
Identifiers: *Refuse Act, *Effluent limitations, Citizen suits.

In the fall of 1972, in response to the obvious inadequacies of federal water pollution control laws, the House and the Senate each passed water pollution control bills which amended and expanded the 1899 Refuse Act and the Federal Water Pollution Control Act. The objectives of both the proposed bills and the final legislation are to restore and maintain the chemical, physical, and biological integrity of the Nations's waters. The legislation requires the application of the best practicable water pollution control technology by July 1, 1977, and the best available technology with cost considerations by 1983. This note describes the Refuse Act of 1899, the now defunct Refuse Act Permit Program and compares the 1972 Amendments to the 1899 Act. Special emphasis is placed on comparing the respective permit programs and citizen suits under the two Acts. Although the 1972 law could still be improved, it remedies most of the deficiencies of the old Federal Water Pollution Control Act and the 1899 Refuse Act. One suggested improvement would be placing strong emphasis on tax incentives for installing pollution control devices to help control pollution at the source. (Mockler-Florida)

DEVELOPMENT OF A STATE WATER--PLANNING MODEL, PART IV, DATA PREPARATION,
Montana State Univ., Bozeman. Water Resources Research Center.
T. Williams, D. Boyd, and R. Brustkern.
Available from the National Technical Information Service as PB-222 011, $3.00 in paper copy, $1.45 in microfiche. Report No 34, January 1973. 192 p, 13 append. OWRR-B-029-MONT (6).

Descriptors: *Water resources planning, *Planning, *Data processing, *Model studies, *Data collections.

Development of the state water planning model has been described in earlier reports (See W71-10641, W72-10435, and W73-05578). The model is a system of mathematical expressions and equations, programmed for solution on a digital computer. To use the model, it is necessary to supply as input, data of various kinds. The earlier reports have distinguished between 'primary' and 'secondary' data. Primary parameters are those for which historical records have been kept and which are available in the literature. Typical are precipitation, reservoir storage and stream discharge. Secondary parameters are those for which no records are presently available, and for which values must be estimated or generated through the model itself. Typical secondary parameters are groundwater discharge, infiltration, and consumptive use. This report describes the data compilation procedures and explains how basin average or 'lumped' values were obtained. It also documents the data which have been stored on the bank (See also W73-11709) (Holje, Montana).
W73-11708

DEVELOPMENT OF A STATE WATER--PLANNING MODEL, PART V, DATA BANK OPERATORS MANUAL,
Montana State Univ., Bozeman. Water Resources Research Center.
D. I. Stanfield, Sr., and W. H. Moore.
Available from the National Technical Information Service as PB-222 012, $3.00 in paper copy, $1.45 in microfiche. Report No 35, Jan. 1973. 87 p, 6 append. OWRR B-029-MONT (7).

Descriptors: *Water resources planning, *Model studies, *Data collections, *Computers, Montana, Computer programs.

The water resources data-bank was developed for the Water Resources Division of the Department of Natural Resources, Helena, Montana, in cooperation with the Department of Civil Engineering, Montana State University, Bozeman. Complete details are provided of the data bank as it now exists. All pertinent information is set forth including actual data resident in the bank,

completed programming specifications for data not yet available, a complete set of all associated programs written for the system, all data formats, and a discussion of the random access feature and keying formats. Also included is a special section dedicated to those system features implemented only on the XEROX SIGMA 7 machine and not on the IBM 360/40. A detailed analysis is presented of the DATA-BANK UPDATE program from a programming point of view. This will enable system analysts to make further additions to the system without in-depth referrals to the originating source. (See also W73-11708) (Holje, Montana).

MANAGEMENT SCIENCE, ECONOMICS AND ENVIRONMENTAL SCIENCE,
Resources for the Future, Inc., Washington, D.C.
A. V. Kneese.
Management Science, Journal of the Institute of Management Sciences, Vol 19, No 10, p 1122-1137, June 1973. 1 fig, 18 ref.

Descriptors: *Management, *Economics, *Environment, *Political aspects, *Ecology, Atmosphere, Optimization, Mathematical models, Water resources, Regions, Simulation analysis, Governments, Constraints, Cost-benefit analysis, Pollution abatement, Linear programming.
Identifiers: *Russel-Spofford model, *Residuals management, *Microeconomics, *Environmental quality.

Microeconomics and management science are closely related in terms of the tools they employ; both treat as a central question the matter of how one optimizes for an objective, in a static or a dynamic setting, given constraints upon the resources available to achieve it. Economics differs primarily in that it studies the performance of entire economic systems and major subsystems. Management science models can be expanded to examine environmental policy and the design of institutions for environmental management. This is illustrated by a quantitative model which incorporates as submodels natural atmospheric and ecological systems and the political structure of alternative forms of representative government. This model, the Russel-Spofford regional residuals management model, utilizes linear programming; furthermore, its components include environmental models (physical, chemical, and biological) which describe the fate of various residuals after their discharge into the natural environmental systems, and a set of receptor-damage functions relating the concentration of residuals in the environment and the impact on living things to the resulting damages. Evaluation and the objective function, theory of collective choice, and politicizing the Russel-Spofford model are discussed. (Bell-Cornell)

IMPLICATIONS OF A SYSTEMS APPROACH TO OCEANOGRAPHY,
Washington Univ., Seattle. Dept. of Oceanography.
J. J. Walsh.
Science, Vol 176, No 4038, p 969-975, June 2, 1972. 3 fig, 1 tab, 79 ref.

Descriptors: *Oceanography, *Biomes, *Systems analysis, Computers, Model studies, Simulation analysis, Marine plants, Marine biology, Marine fish, Marine animals, Data collections.
Identifiers: *Marine ecosystems, *Marine biomes.

A detailed survey of the use of systems analysis for modeling marine ecosystems is presented. Contemporary data acquisition and computer systems on ships enable oceanographers to examine data on a large number of variables while at sea. This ability to rapidly examine the changing parameters of a marine ecosystem, through either continuous monitoring or cooperative experiments aboard ship, has led oceanographers to consider undertaking holistic studies of marine exosystems. Sufficient data on the distribution of system variables can be processed fast enough for individual oceanographers to interact at sea rather than years later, to plan group experiments while in the study area, and to begin to use simulation models as tools for the synthesis of incoming data. (Bell-Cornell)

POPULATION AND POLLUTION IN THE UNITED STATES,
Resources for the Future, Inc., Washington, D.C.
R. G. Ridker.
Science, Vol 176, No 4039, p 1085-1090, June 9, 1973. 3 ref.

Descriptors: *Pollution abatement, *Population, *Wastes, *Model studies, *Environment, Water quality, Economics, Technology, Institutions, Systems analysis.

Man-made pollution arises as a consequence of flows of materials such as metals, fuels, and foodstuffs through the economy. Presented is a model describing the principal links between environmental pollution on the one side and population and per capita incomes on the other. Pollution is measured in points emitted per year. The proportion of unrecyclable wastes to the level of economic activity is considered, as well as damages caused by the concentration of pollution. Three kinds of damages are: (1) harm to economically valuable goods and services, such as fish killed by DDT; (2) human mortality; and (3) a wide variety of losses resulting from physical changes in the environment. Considered next are the major factors that could cause significant changes in these parameters. Discussed are: Changes in the geographic distribution of population, in the amount and composition of consumption, and in technology and institutions. It is concluded that no single cause is sufficient to explain this country's environmental problems. A slowdown in the rate of population growth is advocated to give the American people more time, time to allow for massive changes in attitudes and behavior patterns necessary for improving the quality of the environment. (Bell-Cornell)

DETERMINING THE BEST SIZES OF THE OPEN CUT CANALS USED IN HYDROAMELIORATIONS,
U. Berar, V. Ionescu, and D. Somnea.
Economic Computation and Economic Cybernetics Studies and Research, No 4, p 99-106, 1972. 3 fig, 2 tab, 7 ref.

Descriptors: *Canals, *Dimensions, *Hydraulics, Optimization, Estimating, Equations, Mathematical models, Irrigation water, Excess water (Soils), Water flow, Size, Systems analysis.
Identifiers: *Open cut canals, *Hydroameliorations, Froude's number, Water depth.

The dimensioning of open cut canals used for bringing irrigation water or for evacuating excess waters in the case of draining systems is a constant consideration on the part of many researchers because of the laborious necessary computing method. Many methods (envisaging graphs, tables, slide rules, etc.,) exist for the dimensioning of these structures, but generally they are difficult to use. A mathematical model is proposed which should solve the problem of the dimensioning of the irrigation canals in a number of cases. Results are presented in the form of tables. (Bell-Cornell)

NATURAL RESOURCE INFORMATION SYSTEM, VOLUMES I AND II.
Boeing Computer Services, Inc., Seattle, Wash.

Available from NTIS, Springfield, Va 22151 Vol. 1 p PB-211-381 Vol II as PB-211 382 Price $3.00 printed copy each; $1.45 microfiche, each. April 28, 1972. 102 p, 20 fig, 10 tab, 10 ref. NASA Task No. 160-75-04-12-10.

Descriptors: *Land management, *Remote sensing, *Aerial photography, *Data processing, Computer programs, Systems analysis, Input-output analysis, Information retrieval, Planning, Watershed management, Satellites (Artificial).
Identifiers: *Natural resources data processing.

The Bureau of Indian Affairs (BIA) and the Bureau of Land Management (BLM) are managing approximately 20% of the United States land area, some 475 million acres. Recognizing the need for development of a computer based information system which would handle remote sensing as well as conventional mapping data, BIA and BLM contracted with Boeing Computer Services for the design and construction of a prototype natural resources information system. The primary objective was the design of a computer based system which would store, process, and display data of maximum usefulness to land management decision making. The system was to include graphic input and display, and the use of remote sensing as a data source; it was to be useful at multiple management levels. The report is presented in two volumes. Volume I summarizes program activities and provides a brief description of the Natural Resources Information System. Volume II pro-

vides computer system operating procedures and instructions. (WoodardoUSGS)

WATER RESOURCES DATA IN ALABAMA,
Auburn Univ., Alabama. Dept. of Civil Engineering.
C. H. Harrison.
Available from NTIS, Springfield, Va. 22151 as PB-213 850 Price $3.00 printed copy; $1.45 microfich. Contract Report for Alabama Development Office, February 1972. 88 p, 1 fig, 8 tab, 74 ref. WRP 71-1.

Descriptors: *Data collections, *Alabama, *Data processing, *Hydrologic data, Computers, Planning, Water resources development, State governments.

Needs for water resources data in Alabama are compared with available data sources. The greatest deficiency is in the area of surface water quality data. Very little of the water pollution control and management data requested by the Federal Environmental Protection Agency are available in Alabama. The principle recommendations for data management are: increased utilization of computer services now offered by the U.S. Geological Survey, collection of more streamflow and water quality data during periods of low flow, employment of three programmer-engineers to aid in water resources planning and management, and consideration of the needs of the Department of Conservation in the collection of water resources data. A central computerized water resources data bank for Alabama is not recommended. (Knapp-USGS)

In: Proceedings (Vol I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 16-30, (1972) 3 fig, 4 tab, 21 ref.

Descriptors: *Environmental control, *Methodology, *Mathematical models, Water resources, Decision making, Monitoring, Design, Probability, Distribution, Filters, Volcanoes, Systems analysis, *Risks.
Identifiers: *Environmental systems, *Bayesian design methods, Kalman-Bucy filtering techniques, Rare occurrences theory.

In order to achieve effective environmental control, it is necessary to develop methodologies for dealing with uncertainty. A rational design method allows engineers to find the best solution, given all the available (but uncertain) information. A mathematical model is interpreted as a formalism for expressing uncertainty and implementing Bayesian design methods. The nature of uncertainty in models and data of environmental systems is examined, and a framework for dealing with uncertainty in environmental systems is established; in particular, concepts of Bayesian design and estimation theory are reviewed and redefined relative to environmental systems. The general theory is translated into a useful tool for coping with uncertainty in environmental systems using Kalman-Bucy type filtering techniques. Applications and examples include design of monitoring systems, adaptive decision making for control model identification and parameter estimations. The theory of rare occurrences is applied to volcanic eruptions to illustrate the importance of rare occurrence distributions in environmental systems. Conclusions include: 1) Uncertainty in environmental systems can be treated quantitatively and effectively; 2) Bayesian design is a rational approach, providing the necessary theoretical framework; and 3) the general theory can be translated into effective problem solving tools having application in design and management. TECHNOLOGICAL UNCERTAINTY IN THE ECONOMIC EVALUATION OF NEW WATER RESOURCES,
Hawaii Univ., Honolulu. Coll. of Business Administration.
N. A. El-Ramly.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resources Systems, University of Arizona, Tucson, December 11-14, 1972. p 48-63, (1972). 1 fig, 6 ref.

Descriptors: Technology, *Water resources, *Economics, *Evaluation, Performance, Costs, *Decision making, Analytical techniques, Alternative planning, Mathemtaical models, Systems analysis, *Risks.
Identifiers: New systems, Confidence levels, Subjectivity (Judgment).

Presently, the accumulated operational data about new water resources (i.e., water reuse, desalting, cloud seeding) are inadequate for objective estimation of the probability distributions of their performance characteristics. Presented is a conceptual framework for taking into account, in economic evaluations, the varying degrees of confidence professed in prospective technological possibilities. To show how technological uncertainties may be evaluated, an investment concept--uncertainty cost of new systems--is introduced and analyzed. The subjectivity of uncertainty is discussed, and a conceptual representation of the effect of information upon confidence level is developed. A simple analytical model describing the decision problem of choice between two alternatives with different levels of confidence in achieving anticipated performances is suggested. This model can be used to arrive at decisions in specific cases provided that the uncertainty cost can be estimated. Finally, the conceptual framework is applied to interpret some general trends, and to provide objective explanations for decisions in specific cases. Although attention is focused on explaining the manner in which the proposed methods of analysis can be used in the economic evaluation of new water resources, nevertheless the conceptual framework is equally valid to any situation where competing systems with different degrees of uncertainty are involved. INFORMATION TRANSFER VIA REGRESSION IN MARKOVIAN WORLDS,
IBM Watson Research Center, Yorktown Heights, N.Y.
J. R. Wallis, and N. C. Matalas.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 410-447, (1972). 2 fig, 18 tab, 11 ref.

Descriptors: Hydrology, *Monte Carlo methods, *Stochastic processes, Water demand, Hydrologic data, Networks, Analytical techniques, Probability, Decision making, *Risks.
Identifiers: *Information transfer, *Data programs.

The uncertainity in the transferrability of information via regression is examined. Monte Carlo experiments used to assess the risks inherent in deciding whether or not estimates of correlation

coefficients exceed critical values for information transfer are discussed. By Monte Carlo technique, it is found that the information content of the mean is rather insensitive to values of the serial correlation coefficient experienced in hydrology. Similarly with respect to the variance, the information content is more sensitive to serial correlation, particularly for positive values. The use of sample estimates of serial and cross correlation introduces uncertainity as to whether or not information is transferrable between sites. In terms of the prior distribution for the population values of serial and cross correlation, the probability of making the correct decision regarding the transfer of information on the bases of the sample estimates of serial and cross correlation has been defined over the complete sample space. This probability apparently is not extremely sensitive to the assumed prior distributions nor to the length of sequence. Sensitivity increases as the values on which the priors are concentrated approach the decision for the transfer of information as defined by the population serial and cross correlations. 6B. Evaluation Process

A CASE STUDY IN INTERSTATE RESOURCE MANAGEMENT: THE CALIFORNIA-NEVADA WATER CONTROVERSY, 1865-1955,
California Univ., Davis. Dept. of History.
W. T. Jackson, and D. J. Pisani.
Available from the National Technical Information Service as PB-222 028, $4.50 in paper copy, $1.45 in microfiche. Water Resources Center, University of California Davis, Contribution No 142, May 1973. 51 p. OWRR A-046-CAL (1). UCAL-WRC-W-380.

Descriptors: *Interstate, *Water allocation (Policy), *Lake Tahoe, *History, California, Nevada, Competing uses.
Identifiers: California-Nevada Interstate Water Conference.

A historical summary and evaluation are presented of the controversy between Northern California and Nevada over capture, storage, and distribution of the water supply originating in the Sierra Nevada mountains between the two states. The water controversy is described from the perspective of formal interstate efforts to satisfy those interests and find an equitable way of dividing 'surplus' water between the two states. The majority of the report is concerned with interstate efforts to resolve differences over water allocation, uses, and management from 1931 to 1955. Although significant, the California-Nevada Interstate Water Conference played a relatively ineffective role during this period.
W73-11705

AN INTERACTIVE ANALYSIS OF NATURAL RESOURCE ALLOCATION IN A CONTEMPORARY ESTUARINE ECOSYSTEM,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
A. L. Sullivan.
Available from the National Technical Information Service as PB-222 003, $3.00 in paper copy, $1.45 in microfiche. Technical Report 66, May 1973. 18 p, 1 fig, 6 ref. OWRR-A-023-NY (1). 14-01-0001-1852 and 3032.

Descriptors: *Ecosystems, *Estuarine environment, *Long term planning, *Planning, *Resource allocation, *Water values, Beaches, Boating, Coastal marshes, Dredging, Estuarine fisheries, Fishing, Land development, Landfills, Marine fisheries, Model studies, Resource mix, Shellfish, Water pollution effects, Water resources.
Identifiers: Long Island (New York).

Using the bicounty Nassau-Suffolk region of Long Island as a case study, it was found that the natural resources and resource-use processes of the estuarine zone could be conceptually related in a 'system'. This ecosystem and its interrelationships were specifically displayed in a matrix form so that planning analysis for management decisions could be accomplished. Visually, the twenty-one important processes occurring in the physical, biological, resource-use (market) and socio-economic sectors of the system have been related. The effect of an increase in any one process on all of the others has been indicated in a directional sense as causing an increase, decrease, no effect or countervailing effect. The implication of these effects for planning future activities has been discussed. Emphasized in this study are: fish and shellfish, sand and gravel, waterfront land for housing and commercial development, dredging, erosion, recreational activities including boating, fishing, and swimming, park development, pesticide application and waste discharge. In addition to indicating the probable consequences on all other processes of planning decisions to increase a certain activity, the matrix also provides information about causes. If a result (e.g., loss of aesthetic quality in the estuarine zone) is deemed undesirable, citizen decision makers can be shown graphically those activities or processes causing the undesirable situation.

Descriptors: *Flood forecasting, *Precipitation (Atmospheric), *Storms, *Storm runoff, *Rainfall-runoff relationships, Surface runoff, Overland flow, Discharge (Water), Peak discharge, Water yield, Water loss, Water levels, Subsurface flow, Antecedent moisture content, Moisture availability, Small watersheds, Tributaries, Mountains, Equations.
Identifiers: *Ukraine, *Dniester River, Travel time, Nomograms.

Conditions of formation of outstanding storm floods are analyzed for 4 right-bank tributaries of the Dniester River (Bystritsa, Lomnitsa, Svicha, and Stryy), and a method is proposed for calculating channel inflow from storms and for forecasting maximum flood levels. The depth of storm floods is determined mainly by antecedent moisture conditions of the basin and by amount and intensity of precipitation. Catastrophic storm floods result whenever sufficiently intense rains (10 or 20 mm/hr or greater) occur on a water-saturated ground surface for a 4-6 hr period or more. Moisture conditions of a basin are considered to be critical whenever the basin moisture index is 200 mm or more or the coefficient of relative moisture availability is not less than one. Peak flow on mountain streams of the Dniester basin is derived mainly from high rates of surface runoff. Average values of surface and subsurface flow are 67 mm and 57 mm, respectively, which are 54% and 46% of the entire flood volume. The maximum daily subsurface flow is about 40 mm. An average of about 30% of the total volume of subsurface flow reaches the channel during the first days of the storm period. (See also W73-11825) (Josefson-USGS)

REPORT OF HYDROELECTRIC SUBPROJECT,
Idaho Univ., Moscow. Dept. of Electrical Engineering.
P. Mann.
Available from the National Technical Information Service as PB-222 059, $3.00 in paper copy, $1.45 in microfiche. University of Idaho, Moscow, Water Resources Research Institute, Scenic Rivers Study, Report No 6, 1973, 60 p, 2 fig, 23 tab. OWRR B-014-IDA (15). 14-31-001-3074.

Descriptors: *Hydroelectric power, *Benefits, Idaho, *Water resources development, Alternative water use, Pacific Northwest U.S.
Identifiers: Salmon River (Idaho).

The Salmon River is considered as a single-purpose hydroelectric energy resource from its mouth to North Fork, Idaho, (the 'Study River' portion of the river). This stretch is supported by one storage project on the upper river to represent upriver development in general. Total obtainable storage from the 7 project complex is more than adequate to regulate an average year flow to a winter power peaking pattern judged to be compatible with a mature Pacific Northwest hydrothermal system. The peaking capacity of the ultimate system approaches 8,000,000 kilowatts and average power output is 1,552,000 kw. The system is considered to be developed in three stages over a 30 year time span. Net cumulative benefits over the first 50 years of operation total 3.7 to 5 billion dollars. Annual benefits exceed $100,000,000 per year from the completed system and are expected to continue for the second 50 years of the project life. Net equivalent fossil fuel resource saving over the first 50 year term exceeds 300,000,000 tons of coal and over the 100 year term would constitute 1/2500 of the total estimated mineable U.S. coal reserves.

WATER AND SEWER FACILITY PLAN FOR ADAMS COUNTY, COLORADO.
Oblinger-Smith Corp., Denver, Colo.

Prepared for the Colorado Division of Planning, 1972. 51 p, 14 tab, 11 maps.

Descriptors: *Planning, *Water supply, *Sewerage, Natural resources, Projections, Rural areas, Colorado.
Identifiers: *Adams County (Colorado), Small utility systems.

This general planning study is intended as a comprehensive plan for development of municipal or public water and sewer systems to satisfy both present and future needs. Urban areas of the County near Denver are not included. The study focuses on the small towns of Bennett and Strasburg and recommends the development of additional wells, the extension of the water distribution systems, improved water and wastewater treatment, and the extension of sewer mains. Background information is presented on the county as a whole. This includes natural resources, especially soils, economic and population analyses, land use projections, community facility inventories, and several maps of the county. (Elfers-North Carolina)

WATER POLICIES FOR THE FUTURE.
National Water Commission, Arlington, Va.

Available from GPO, Washington, DC 20402, Price $9.30. Final Report to the President and to the Congress of the United States, Washington, DC, June 1973. 579 p, 8 fig, 51 tab, 4 append.

Descriptors: *Planning, *Water resources development, *Water policy, *National Water Commission, Federal government, Legislation, Social aspects, Water management (Applied).

The National Water Commission's conclusions and recommendations are presented on the policies which it believes the Nation should adopt. The adequacy of basic data to support evaluation, planning, and decisionmaking in water resources varies considerably. It is strongest with respect to the quantitative aspects. The areas of greatest need are in the water quality, environmental, socioeconomic, and water-use aspects, including improvement in the program of reporting flood damages. The presently diversified water resource research effort (i.e., mission agency research and grant agency research) has generally served the Nation well. To assure continued success, steps should be taken to develop a closer tie between planning and research in order to reinforce the value and relevance of each. If the Nation is to aggressively explore the research and development of new technologies in water resources and related fields, it is important that an agency or office charged with this mission be established. A PROPOSAL FOR A MODEL RIVER PROJECT CONCERNING 'RIVERFRONT BEAUTIFICATION AND UTILIZATION IN METROPOLITAN AREAS.'
Omaha-Council Bluffs Riverfront Development Committee, Nebr.

May 20, 1971. 16 p, 14 fig, 3 append.

Descriptors: *Planning, *Recreation, Scenic highways, *Parks, Environmental effects, *Nebraska, *Missouri River.
Identifiers: *Riverfront beautification, Omaha (Neb), Council Bluffs (Neb).

American cities have generally neglected the potential beauty of their rivers. A four point program is presented to beautify and redevelop the riverfront area along the Missouri River in Omaha and Council Bluffs. The program calls for two 54 mile scenic, riverside parkways one one each side of the river; the development of a linear park encompassing the parkways and including water-oriented facilities and trails; the careful planning of future development near the river area such as new towns, office parks, and entertainment facilities; and a comprehensive effort to control pollution, conserve wildlife habitat, and generally improve the natural environment. Implementation of the program is envisioned via a pilot project or 'model river' approach. Federal, state, and local agencies are expected to be involved with the Corps of Engineers being the main coordinating agency. (Elfers-North Carolina)

WATER FOR ALABAMA--IDENTIFICATION OF OBJECTIVES,
Geological Survey of Alabama, University.
H. C. Barksdale.
Available from NTIS, Springfield, Va 22151 as PB-213 715 Price $3.00 printed copy; $1.45 microfiche. Administrative report, December 1969 (revised May 1970). 57 p.

Descriptors: *Water resources development, *Alabama, *Groundwater, *Surface waters, Management, Watershed management, Data collections, Hydrologic data, Project planning, Economics, Water supply, Water demand, Water quality control, Sediment control, Flood control, Urban hydrology, Hydrogeology, Streamflow.

The fundamental and the major subsidiary objectives of the current water-resources planning activity in Alabama are presented. The fundamental objective--to assure the development of the water resources of the state in the interest of all its people--is obvious and requires little elaboration. The subsidiary objectives are necessary steps toward the achievement of the fundamental objective. Each of them is discussed at some length to clearly present its scope and intent. The most pressing need for water-resources knowledge is for data on water use. Other additional knowledge needed is largely in the form of pointed additions to the existing backlog of hydrologic and economic data. The more important of these are: quantitative knowledge of the interrelations between groundwater and surface water in areas where problems may be developing as in the Huntsville and Mobile areas; quantitative knowledge of the potential yield of groundwater sources; and an expansion and intensification of the systems for collecting the time-resource data needed for management decisions. WITHDRAWAL OF WATER BY INDUSTRY IN ILLINOIS, 1970-1971,
Illinois State Water Survey, Urbana.
D. H. Schnepper, J. C. Neill, and R. L. Evans.
Circular 115, 1973. 17 p, 5 fig, 7 tab, 6 ref.

Descriptors: *Withdrawal, *Illinois, *Industrial water, Water utilization, Water reuse, Reclaimed water, Cooling water, Industrial plants.

During 1970-71 in Illinois, 11,020 million gallons per day of water was withdrawn by industry. Surface waters supplied 10,709 mgd; groundwater sources provided 311 mgd. The largest withdrawal, 80% of the total, was by steam electric powerplants and the second largest withdrawal was by the primary metals industry. As the result of reuse and conservation, water withdrawal by industry in Illinois has remained fairly stable during the past decade, despite increases in productivity. (Knapp-USGS)

Descriptors: *Crayfish, *Rice, *Louisiana, *Fish farming, Farm ponds, Fish harvest, Rotations, Productivity.
Identifiers: *Crayfish farming.

Most of the U.S. crayfish industry is limited to Louisiana, and until a few years ago, was found almost exclusively in south Louisiana. Even with this limitation well over 10 million pounds, valued at some $5 million, is harvested annually, and close to 35 crayfish processing plants have been licensed by the Louisiana Board of Health. Crayfish farming began over 25 years ago. Crayfish are currently being farmed in three types of ponds: rice-field ponds, wooded ponds, and open ponds. In rice-field ponds crayfish are rotated with the rice. The general procedure followed by the rice farmers is to remove water from the rice field about two weeks before harvesting. This permits drying of the field to facilitate harvest. When drying begins, crayfish burrow. The second growth of rice and grasses, along with rice straw, provides food for the crayfish. Open ponds are often constructed solely for crayfish farming. In July the ponds are drained, mainly as a means of predator control since racoons and wading birds may make serious inroads on the crayfish. In September or October, the ponds are flooded to release them. Crayfish cultured in ponds are harvested in the same manner as in the wild. Both lift nets and funnel traps of chickenwire are used. Ponds with good production yield from 200 pounds to as high as 800 pounds of crayfish per acre. The price generally averages 25 cents a pound. The future of the crayfish industry looks promising and ponds devoted to crayfish farming are increasing. (Knapp-USGS)

INVENTORY AND ANALYSIS OF EXISTING WATER AND SEWER SYSTEMS AND LONG RANGE WATER AND SEWER PLANS, NATCHEZ, MISSISSIPPI,
Jordan, Kaiser and Sessions, Natchez, Miss.
A. R. Winter.
Available from the National Technical Information Service as PB-212 390, $4.25 paper copy, $0.95 in microfiche. Jordan, Kaiser and Sessions,

Consulting Civil Engineers, Natchez, Mississippi, May 1972. 25 p, 13 fig.

Descriptors: *Data collections, *Water works, *Water supply development, *Sewers, Sewerage, Urban drainage, Planning, Water supply, Sewage treatment, Sewage disposal, Mississippi, Water resources, Water distribution (Applied), Water demand, Water pollution, Water pollution control.
Identifiers: *Natchez (Miss).

An inventory and analysis of present water and sewerage systems was made for the Natchez, Mississippi Metropolitan Area and, based on this information, improvements are suggested. Although the Natchez area has an abundant quantity of water in surface and underground sources, shallow underground sources are contaminated by a high iron content and salt discharges from oil wells. The water is very hard, chemically. The City of Natchez is served by 9 water wells varying in depth from about 400 to 600 feet with a total rated capacity of 4.6 mgd. Smaller utilities serve outlying portions of the metropolitan area. Improvements are financially feasible only for the City Water Works and one of the private utilities. Planned improvements consist primarily of extending water service in the area and increasing supply capacity. Sewerage facilities within Natchez are provided by the City Water Works and, with only a few exceptions, the City is adequately sewered. Several subdivisions located outside the city limits are also connected to this system, while the rest of the area has no sewer system. No sewage treatment is provided for any of the areas. Improvements to the sewage collection and treatment system will consist of construction of a treatment plant to replace the outfall to the Mississippi River, as well as extension of sewers in all parts of the city. Storm drainage problems relate primarily to erosion of a 140 foot bluff along the Mississippi River, and other erosion problems. Extensive financial assistance will be needed for improvement of storm drainage. (Poertner)

CURRENT WATER USE REQUIREMENTS IN THE QU'APPELLE RIVER BASIN,
Saskatchewan Water Resources Commission, Regina. Investigation and Planning Branch.
R. L. Kellow.

Qu'Appelle Valley Project, Item 210, July, 1970. 74 p, 1 fig, 20 tab, 2 append.

Descriptors: *Water users, *Water demand, Industrial water, Municipal water, Water rights, Irrigation, *Canada.
Identifiers: Inventories, *Qu'Appelle River Basin, Saskatchewan, Regina, Moose Jaw, Melville.

The Qu'Appelle River basin has current water requirements of more than an estimated 167,000 acre-feet per year. The largest water use class is the industrial sector, especially electric power, petroleum and mining industries, and accounts for 77% of the total use. Current water requirements were determined for industries supplied by municipal water systems and by those such as electric companies, who provide their own water supplies. The second largest sector of water use was municipal. The cities of Regina, Moose Jaw and Melville accounted for 87% of this use. This sector was also subdivided into industrial, commercial, residential, and public uses. Two other sectors which had relatively small use requirements but which also could not depend on large supplies of water were rural households and communities without water systems, and stockwatering where the net consumption in 1966 in the basin is estimated to have been 1,000 acre-feet. Losses due to evaporation and losses in transmission may be substantial. Present gross requirements for stockwatering are thought to be considerably higher than the 1966 estimate. A section deals with water rights projects, e.g. irrigation projects where data on authorized irrigation projects with annual allocations greater than 9 acre-feet is used to make preliminary estimates of current irrigation water requirements. (Elfers-North Carolina)

REPORT ON WATER SUPPLY STUDY OF CERTAIN URBAN COMMUNITIES IN THE QU'APPELLE RIVER BASIN.
Saskatchewan Water Resources Commission, Regina. Water Rights Branch.

Prepared for the Qu'Appelle Basin Study Board, February, 1972. 43 p, 8 tab.

Descriptors: *Water supply, *Water demand, *Water requirements, Water sources, Water resources development, Projections, *Canada.
Identifiers: *Qu'Appelle River Basin, Saskatchewan, Manitoba.

This study assesses the water supplies of twenty-three communities in relation to water demands to 1985 and 2000. Water supplies were divided into three classifications: (1) supplies and systems currently being used; (2) supplies and systems that already exist but are not presently being used by the community in question; and (3) supplies that could be developed from presently undeveloped sources. These sources or supplies were also evaluated in terms of reliability, both hydrologically and potential for implementation. Some of the communities will be unable to meet future water demands under the first two classes of water supplies and thus must begin to investigate potential undeveloped sources of water. Community-by-community analysis of the three classes of water supplies relevant to each community and various conclusions in relation to future supplies plus tables of data, particularly on water demands or requirements are provided. AN ACT PROPOSING AN AMENDMENT TO ARTICLE IV, SECTION 93, AS AMENDED, OF THE CONSTITUTION OF ALABAMA RELATIVE TO PROVIDING IRRIGATION AND WATER CONSERVATION IN THE STATE.

Act No 505, Acts of Alabama, p 1229-1230, 1971.

Descriptors: *Alabama, *Constitutional law, *Legislation, Water conservation, Distribution systems, Land development, Water rights, Irrigation programs, State governments, Government finance, Irrigation, Water resources development.

This proposed constitutional amendment provides that when authorized by the Legislature the state may, in promoting and aiding irrigation and water conservation, engage in works of internal improvement by promoting, developing, constructing, maintaining and operating within the state irrigation projects and facilities related thereto, or it may guarantee the repayment of all or a portion of any loans to any body corporate organized for such purposes under the provisions of the Alabama Constitution and pledge to the payment of such loans the full faith and credit of the State. Nothing in the bill authorizes the State, directly or indirectly, to engage in or finance the production, transmission or sale of electric power. The bill also sets out the time and place of the general election to consider passage of this bill. (Mockler-Florida)

DEPARTMENT OF ENVIRONMENTAL QUALITY; EXECUTIVE COMMITTEE.
Iowa Code Ann. secs. 455B.1 thru 455B.9 (Supp. 1973).

Descriptors: *Iowa, *Environmental control, *Legislation, *Waste disposal, *Water quality control, Administrative agencies, Environment, Air environment, State governments, Governments, Management, Regulations, Solid wastes, Chemical control, Administration, Comprehensive planning, Project planning, Pollution control, Inter-agency cooperation.

The Iowa Department of Environmental Quality (Department) is created, to be headed by an Executive Director (Director). The Director shall recommend the adoption of rules designed to implement the programs and services of the Department, as well as facilitate administration of the Department. He shall also contract with the public agencies of the state to provide all services necessary to implement this section. Within the Department, the Air Quality Commission, Water Quality Commission, Chemical Technology Commission and Solid Waste Disposal Commission are created. Each Commission shall advise, consult and cooperate with other Commissions, agencies and political subdivisions to accomplish its responsibilities. An executive committee composed of the

Chairmen of the four commissions and others shall review the rules proposed by the Executive Director and adopt those deemed necessary, and shall also insure integration and cooperation of the programs administered by the Department. Provisions for the organization, administration, and financing of the Department and the four commissions within the Department are included. (Glickman-Florida)

THE SEABED ARMS CONTROL TREATY: A STUDY IN THE CONTEMPORARY LAW OF THE MILITARY USES OF THE SEAS,
P. S. Rao.
Journal of Maritime Law and Commerce, Vol 4, No 1, p 67-92, October 1972.

Descriptors: *Treaties, *Law of the sea, *United Nations, *International waters, *Military aspects, Water law, International law, Jurisdiction, Legal aspects, Oceans, Political aspects, Continental shelf, Navigation.
Identifiers: Coastal waters, Contiguous zone.

The Seabed Arms Control Treaty was approved by the United Nations in 1970. The prohibitions agreed upon exclude all of the important contemporary military uses of the sea. The parties to the treaty will have the right to observe all seabed installations in the normal course of the exercise of the freedom of navigation. One value of the treaty lies in the classification of the status of several military uses of the seas. This comes at a time when the entire body of the contemporary law of the sea has been undergoing reexamination. During negotiations surrounding the ocean arms control measures different claims regarding the permissibility or impermissibility of certain kinds of military uses of the sea were considered. An attempt has been made to resolve the conflicts between the right of freedom to the high seas and the exclusive rights granted to the coastal states over the continental shelves. Through May 1972 some thirty-five nations (listed herein) had ratified the treaty. (Mockler-Florida)

DRAINAGE UNDER STATE LAWS (MINNESOTA AND ARKANSAS).

43 U.S.C. secs. 1021 thru 1048 (1970).

Descriptors: *Drainage, *Governmental interrelations, *State jurisdiction, *United States, *Legislation, Federal government, Water resources development, Jurisdiction, Legal aspects, Reserved lands, Water rights, Land use, Drainage programs, Drainage systems, Flood control, Water management (Applied), Public lands, Federal jurisdiction, Indian reservations, Arkansas, Minnesota.

All of the unentered, unreserved public lands and all of those entered lands in Minnesota and Arkansas for which no final certificates have been issued are made subject to the laws of the state in which they are located. However, it is also provided that the United States and all persons holding unpatented lands under entries made under the public land laws of the United States shall be accorded all the rights given by the state laws to persons holding lands in private ownership. In addition to the subjection of these lands to state laws for drainage for agricultural purposes, the statutes also provide for apportionment of the costs, patents, transfer of lands, issuance of patents, claims, imposition of liens or assessments on federal lands or any ceded or other Indian lands, title to lands, consent of owners of Indian lands, homestead rights, all lands not affected, and canals, ditches, levees, and other drainage works. Moreover, a complete breakdown on the transfer of various functions from federal agencies to the states is also provided. (Mockler-Florida)

BRICKELL V. TRAMMELL (TITLE SUIT TO DETERMINE OWNERSHIP OF SUBMERGED LANDS ALONG NAVIGABLE BODY OF WATER).
82 So. 221-230 (Fla. 1919).

Descriptors: *Florida, *Navigable waters, *Public rights, *Judicial decisions, *Riparian rights, Submerged lands, Equity, Common law, Legal aspects, Water rights, Ownership of beds, High water mark, Watercourses (Legal aspects), Low water mark, Boundaries (Property), Easements, Tidewaters, Channels, Bulkheads, Beds, Legal review.
Identifiers: *Injunctions (Prohibitory), Sovereign states, Title disputes (Submerged land), Constitutional effects (Federal), Trustees of the Internal Improvement Fund.

Appellant, riparian landowner, claimed fee simple ownership to portions of submerged land extending to the natural channel of Biscayne Bay and to a certain partially submerged tract or island. She alleged that certain dredge and fill activities had rendered the submerged lands navigable, and that over her objections appellees, the Trustees of the Internal Improvement Fund, had sold, but not delivered, the deed to the partially submerged island to a third party. Appellant requested an injunction restraining delivery of such deed and that the trustees be adjudged unauthorized to sell such island. The complaint did not exhibit paper title from any sovereignty. Appellant claimed here predecessors in title had such fee simple title by virtue of an 1856 legislative act. The court held for the trustees. It held that the 1856 act only granted easements to those riparian owners who owned property to the high water mark, and that all other submerged lands were owned by the sovereign state. There was nothing in the title to the original grantor that indicated she received title to said low water mark, no adequate proof of such ownership by the complainant. The state of Florida was found to hold the submerged property in trust for the people of the state, and the trustees could properly dispose of same. (Smith-Adam-Florida)
W73-11967

BURNS V. COASTAL PETROLEUM COMPANY (ACTION TO DETERMINE WHETHER BOTTOM OF LAKE WAS INCLUDED WITHIN OIL AND MINERAL LEASE).

194 So. 2d 71-76 (1st D.C.A. Fla. 1966).

Descriptors: *Florida, *Leases, *Oil industry, *Lake beds, Legal aspects, Adjacent landowners, Contracts, Judicial decisions, State jurisdiction, Legal review, Exploration, Flow channel flow, Legislation, Gulf of Mexico, Boundaries (Property), Oil fields, Mining.
Identifiers: *Legislative interpretation, Trustees of the Internal Improvement Fund (Florida).

Appellants, Trustees of the Internal Improvement Fund, appealed from a declaratory decree holding that the water bottom of Lake Hancock was included within an oil and mineral lease executed by the Trustees to appellees, Coastal Petroleum Company. The court found that oil and mineral rights were not so conveyed. The contract and lease had not been intended to include all state-owned water bottoms which were connected by natural streams to certain named rivers. Extrinsic evidence was disallowed as the lease was sufficiently definite on its face, and the lease documents meant exactly what they said; that is, that the water bottoms covered included only those rivers and lakes named therein. A petition for rehearing was filed which was denied. (Smith-Adam-Florida)

WATER RIGHT CHANGES TO IMPLEMENT WATER MANAGEMENT TECHNOLOGY,
Colorado State Univ., Fort Collins.
G. E. Radosevich.
In: Managing Irrigated Agriculture to Improve Water Quality, Proceedings of National Conference on Managing Irrigated Agriculture to Improve Water Quality, Colorado State University, May 16-18, 1972. p 265-279, (1972) 27 ref.

Descriptors: *Water rights, *Prior appropriation, *Water management (Applied), *Water distribution (Applied), *Water quality control, Irrigation, Agriculture, Legal aspects, Administration, Comprehensive planning, Water law, Irrigated land, Water allocation (Policy), Institutional constraints, Technology, Judicial decisions.

The institutionalization is explored of a legal and organizational system that has directed the course of allocation, distribution and utilization of water in semi-arid western states. One of the dominant features of this system is the concept of a property right in water. This property right concept is at the root of current water problems; through the exercise of this right, not only the quantity but also the quality of water is affected. Both of these aspects are an integral part of effective water management and are discussed. A general discussion of the appropriation doctrine and the nature of the water right concept is included; however, the crux lies with the call for a reassessment of present legal and organizational machinery in light of water demands, water use practices and technological innovation. Changes in the exercise of water rights to induce or require more efficient uses of the resource must and can be made. The water problems of the western states demand a new, flexible and pragmatic solution. (Mockler-Florida)
W73-11969

PROCEDURAL REGULATIONS OF THE NEW ALABAMA WATER IMPROVEMENT COMMISSION,
Union Bank and Trust Co., Montgomery, Ala.
H. A. Leslie.
Alabama Lawyer, Vol 34, p 72-79, Jan 1973. 3 ref.

Descriptors: *Alabama, *Adjudication procedure, *Water pollution control, *Administrative agencies, Water quality standards, Pollution abatement, Regulation, Waste disposal, State governments, Effluents.
Identifiers: *Administrative regulations, *Alabama Water Improvement Commission.

Procedural Regulations of the Alabama Water Improvement Commission were adopted on May 29, 1972. The commission was a product of public demand for strengthening laws relating to water pollution. The regulations provide, among other things, that the Commission shall: adopt regulations establishing water quality standards, adopt effluent limitation guidelines, stream classifications, and any other regulations necessary to control pollution in state waters. All rules and other written statements of policy or interpretations formulated are to be made available for public inspection as are all final orders, decisions, opinions, records, reports or information. Adoption, amendment or repeal of regulations may be formally proposed by a member of the Commission, Chief Administrative Officer, Commissioner of Department of Conservation and Natural Resources, Commissioner of Agriculture and Industries, the State Geologist, the Director of the Alabama Development Office, Attorney General or by petition of 50 or more citizens of the state. The regulations conclude with procedures for adoption of new regulations. (Napolitano-Florida)

UTILIZATION OF GROUND WATER RESOURCES.

La. Rev. Stat. secs. 38:3091 thru 38:3097 (Supp. 1973).

Descriptors: *Louisiana, *Legislation, *Groundwater resources, *Well regulations, *Groundwater mining, Water management (Applied), Water wells, Wells, Administrative agencies, Administrative decisions, Legal aspects, Comprehensive planning, Penalties (Legal), Water supply, Water yield, Regulation, Inspection, Water policy, Water rights, Control systems, Water sources, Subsurface waters.

The Director of the Louisiana Department of Public Works is required to make reasonable rules and regulations regarding the registration of water wells and classification of their use, renewal and application for such registration, to establish regulations regarding the construction of certain water wells, to gather data with respect to existing and future flowing wells, and to regulate the abandoning and sealing of such wells. The director is given authority to hold hearings, to collect data, to authorize personnel to make property inspections, to receive grants and enter into contracts for ground water resources development, to conduct studies in this area, to require the keeping of records regarding use of ground water, and to cooperate with other governmental units to achieve water conservation. Penalties for the violation of provisions under this chapter are set forth. (Dunham-Florida)
W73-11971

KANSAS-NEBRASKA BIG BLUE RIVER COMPACT.
Hearing--Subcomm. on Water and Power Resources--Comm. on Interior and Insular Affairs, U.S. Senate, 92d Cong. 2d Sess, February 23, 1972. 48 p.

Descriptors: *Governmental interrelations, *Interstate compacts, *River basin development, *Appropriation, Federal government, Kansas, Nebraska, Legislation, Administrative agencies, Interstate rivers, Water law, Legal aspects, Administration, Water resources development, Comprehensive planning, Water supply, Water pollution control, Water rights, Priorities, Preferences (Water rights), Interstate Commissions.
Identifiers: *Congressional hearings, *Big Blue River (Kansas and Nebraska).

Hearings were held to take testimony on proposed legislation to consent to the Kansas-Nebraska Big Blue River Compact which was already ratified by the two states. The compact is designed to apportion the waters of the Big Blue River Basin between Kansas and Nebraska, to promote the orderly development of these waters, and to reduce water pollution. The compact creates a compact administration composed of representatives of each state and a non-voting federal member to administer the compact and specifies its functions. Restrictions on water rights and use are placed on both states for their mutual benefit. Included are texts of both Senate and House bills consenting to the compact, reports from interested federal agencies, and statements and testimony of witnesses at the hearing. (Dunham-Florida)
W73-11972

MARINE SANCTUARIES IN CALIFORNIA.

Hearings--Subcomm. on Minerals, Materials, and Fuels--Comm. on Interior and Insular Affairs, U.S. Senate, 92d Cong, 1st Sess, November 1 and 4, 1971. 163 p, 1 plate.

Descriptors: *Legislation, *Continental shelf, *Mineral industry, *Beds under water, Oil, Water pollution control, Legal aspects, Tidal waters, Beds, Mining, Environmental effects, California, Leases, Oceans, Federal jurisdiction.
Identifiers: *Outer Continental Shelf Lands Act, *Congressional hearing.

Testimony was taken on legislation which would create seven marine sanctuaries pursuant to the Outer Continental Shelf Lands Act in areas off the coast of California adjacent to state-owned submerged lands in which the state has already suspended leasing for mineral purposes. Specifically, the purpose of the bill is to create the marine sanctuaries along 250 miles of California Outer Continental Shelf lands, to suspend leasing activities over such lands and to establish a congressional policy with regard to such lands. The legislation provides that the Secretary of the Interior shall suspend all further leasing pursuant to the Outer Continental Shelf Lands Act for the exploration for or extraction of oil, gas, or any other mineral in the portion of the Outer Continental Shelf. Such suspension could be terminated by the President in the event of a declared national emergency; nothing in the act would be deemed to authorize the Secretary to terminate or refuse to renew any lease, to limit any authority to grant rights-of-way, to prohibit any exploration of the Outer Continental Shelf or to grant to the State of California any title or jurisdiction over any portion of the Outer Continental Shelf. (Mockler-Florida)

COASTAL PLAINS REGIONAL COMMISSION--ANNUAL REPORT, 1972.

(1972) 28 p, 25 photo, 1 chart.

Descriptors: *Estuaries, *Atlantic Coastal Plain, *Area redevelopment, *Fish management, *Shellfish farming, Water pollution control, Conservation, Shore protection, Coastal marshes, Fishing, Research and development, North Carolina, Georgia, South Carolina, Grants, Governmental interrelations, Interstate commissions, Federal government, Government finance.

The Coastal Plains Regional Commission's primary task is to plan and implement an attack on the economic conditions which cause an annual loss of over five billion dollars in income to the residents of North Carolina, South Carolina, and Georgia. This report of the Commission's activities covers the period of July 1, 1971 through June 30, 1972. Six hundred miles of coastline and millions of acres of relatively unpolluted estuaries is the region's greatest natural asset. The Commission opened fiscal year 1972 with a $2.4 million grant to help finance construction of a multi-purpose marine resource center in North Carolina, the dedication of the Fort Johnson Marine Resources Center in South Carolina, and for construction of a shell fish facility on Skidaway Island in Georgia. A clam hatchery and oyster-culture operation in North Carolina also received continued Commission support. In addition, the Commission contributed $100,000 to assist the expansion of South Carolina's Bonneau Fish Hatchery and donated $59,000 for an analysis of the structure and marketing practices of the sea food industry. (Mockler-Florida)
W73-11974

SABINE RIVER AUTHORITY.
La. Const. art. 14 sec. 45 (Supp. 1973).

Descriptors: *Louisiana, *Constitutional law, *River basin commissions, *Watershed management, River basin development, Navigation, Flood control, Agriculture, Irrigation, Recreation, Planning, Land management, Legislation, Jurisdiction, Drainage, Hydroelectric power, Governmental interrelations, Water supply development.

The Sabine River Authority is created as an approved instrumentality and agency of the state of Louisiana. Jurisdiction of the authority shall include those parishes or portions of parishes as the legislature may determine, with the view of improving navigation on the Sabine River and its tributaries, providing for adequate drainage and flood control within the Sabine River and the Calcasieu River watersheds, thus utilizing the waters of the Sabine River and its tributaries for the purpose of providing recreation and irrigation, attracting industry to the area, maintaining an adequate water supply for agricultural, municipal, domestic, and industrial use in the Sabine and Calcasieu River watersheds, and for the development of hydroelectric power. The Authority shall be fully authorized to cooperate financially with the U.S. government, the state of Texas and Louisiana and with any political subdivision or agency of these states, as well as the federal government. (Mockler-Florida)
W73-11975

POLLUTION CONTROL UNDER THE PENNSYLVANIA CLEAN STREAMS LAW,
A. Charlson.
University of Pittsburgh Law Review, Vol 34, p 115-129, Fall 1972. 51 ref.

Descriptors: *Pennsylvania, *Mine wastes, *Judicial decisions, *Legislation, Water pollution control, Legal aspects, Waste water disposal, Water quality standards, Law enforcement, Water policy, Mine drainage, Mine water, Water pollution sources, Permits.

The authority of the Commonwealth of Pennsylvania under the Clean Streams Law to control mine drainage pollution has been severely limited in two recent decisions of the Commonwealth Court. In one case, the court held that the operator of an active mine could not be compelled by the Commonwealth to treat polluted water which it pumped from an adjacent inactive mine for the purpose of protecting its active workings. It was held in this case there was no 'mine' within the applicable statutory provision. In the second case polluted water flowed underground from inactive workings into an active mine, commingled with other waters, and subsequently was discharged together with water originating in the active mine. The Court there held there was no 'mine drainage' within the statute and thus no violation of the statute. The court has also required a more stringent standard of fault than is necessary in a system which regulates effluent quality. The Commonwealth Court has erred in its strict interpretation of the Clean Streams Law in these two decisions; there is no reason that liability should not attach every time there is a waste discharge into the waters of the Commonwealth. FLOOD AND EROSION CONTROL.

Iowa Code Ann. secs. 467B.1 thru 467B.15 (1971).

Descriptors: *Iowa, *Flood control, *Soil conservation, *Water conservation, *Legislation, Water policy, Federal government, Local governments, Governmental interrelations, Flood protection, Soil erosion, Public health, Water resources development, Government finance, Grants, Levees, Structures, Federal project policy, Water management (Applied).

Whenever any political subdivision or agency of the state of Iowa shall engage in any project for flood or erosion control, flood prevention or the conservation, development and disposal of water in cooperation with the federal government, the counties in which the project is carried on shall have the authority through the Board of Super-

visors to maintain that project on county lands. Any county may accept federal funds for any such project. The various governmental units involved in these projects may consult and cooperate with each other. When structures or levees necessary for flood or soil conservation control are constructed on county roads, they shall be considered part of the cost of road construction. When projects have been completed on private lands under easement granted to the county, the cost of maintenance may be assumed by the county. Conservation commissioners shall inspect all flood and erosion control structures. Funds received from the federal government because of operations of federal flood control projects shall be allocated between schools, roads and other functions. (Glickman-Florida)
W73-11978

SOIL CONSERVATION AND FLOOD CONTROL DISTRICTS.
Iowa Code Ann. secs. 467C.1 thru 467C.6 (1971).

Descriptors: *Legislation, *Flood control, *Iowa, *Soil conservation, Natural resources, Water resources, Erosion control, Soil erosion, Water conservation, Surface waters, Public health, Water policy, Water management (Applied), Strip mines, Drainage districts, Water districts, Levee districts, Flood protection, Water resources development, Land use, Coal mines.

The conservation of the soil resources, the proper control of water resources, flood prevention and the drainage of surface waters shall be a considered public benefit, conducive to the public health and welfare of the state of Iowa. The County Board of Supervisors (Board) may create districts for soil conservation and flood control, and shall construct improvements deemed essential to accomplish those purposes. The Board may also supervise strip coal mining, to insure that all surface soil is replaced upon abandonment of any mining operation. These new districts may encompass old levee or drainage districts that wish to be included in the conservation and control projects. No proposed district shall be established without the approval of the commissioners of any soil conservation district included all or in part within the proposed districts. (Glickman-Florida)
W73-11979

AN ACT RELATING TO IRRIGATION AND WATER CONSERVATION.
Act No 980, Acts of Arkansas, p 1750-1752, 1971.

Descriptors: *Alabama, *Legislation, *Irrigation, *Water conservation, *Irrigation programs, Conservation, Distribution systems, Land development, Irrigation districts, Water conveyance, Governmental interrelations, Government finance, Constitutional law, Cost sharing.

This act authorizes the state to provide financial assistance and to underwrite and guarantee costs of a pilot irrigation and water conservation project and related facilities. Moreover, it authorizes the state of Arkansas to create a state irrigation development trust fund and provides for the use of the fund. It also provides that any such project shall remain under the supervision and control of the state until all monies owed are repaid. The act becomes effective upon ratification of an amendment to the Alabama Constitution to authorize the legislature to pass laws authorizing the state to aid in promoting and developing irrigation and water conservation. The state may also enter into agreements with any federal agency directly or through an irrigation district whereby the federal government will render financial assistance to such projects. (Mockler-Florida)
W73-11980

INTERSTATE DRAINAGE DISTRICTS.
Iowa Code Ann. secs. 467.1 thru 467.6 (1971).

Descriptors: *Iowa, *Drainage districts, *Governmental interrelations, *Drainage systems, *Legislation, Drainage area, State governments, Legal aspects, Administrative agencies, Water law, Water policy, Inter-agency cooperation, Bond issues, Contracts, Bids, Comprehensive planning, Project planning, Equitable apportionment, Interstate compacts, Public benefits, Administration, Water management (Applied).

Before the final establishment of a drainage district bordering on the Iowa state line, the authorities of this state may hold a hearing to determine the feasibility of a joint project with the drainage district in a bordering state. The Board of Supervisors shall have the power to enter into an agreement as to amounts the property owners of each state should pay toward construction of the joint undertaking. Acceptance of construction bids must be by both states jointly, although contracts for construction of those portions of the project within the state shall be separate from that of the neighboring state. This state may make agreements with the adjoining state for the joint management, repair and maintenance of such improvements. No bonds shall be issued until all litigation in both states shall have been terminated. (Glickman-Florida)
W73-11981

OPERATION OF WATERCRAFT.
Ind. Ann. Stat. secs. 68-813 thru 68-871 (Supp. 1972).

Descriptors: *Indiana, *Legislation, *Boats, *Boating regulations, Navigation, Transportation, Recreation wastes, Pontoons, Recreation, Regulation, Inspection, Permits, Penalties (Legal), Administration, Legal aspects, Local governments.

Speed limits, disposal regulations, toilet regulations, life preserver requirements and restrictions on the operation of watercraft near shorelines are specified in the statute. The operation of a powered watercraft by children, with certain exceptions, is prohibited. The Indiana department of conservation is authorized to etablish speed limits for watercraft and to prescribe areas for special use on lakes and for federal reservoirs financed either wholly or in part with state and/or federal funds. Sitting or standing on gunwales or bow decking and boat racing, with certain exceptions, are prohibited. Lights are required on pontooned boats. The duties of the department are stated in the statute. The department has the authority to promulgate and amend certain rules and regulations. (Reed-Florida)

LITTLE CALUMET RIVER BASIN COMMISSION.
Ind. Ann. Stat. secs. 68-1601 thru 68-1607 (Supp. 1972).

Descriptors: *Indiana, *Legislation, *Water resources development, *River basin commissions, *River basin development, River basins, Planning, Watersheds, River systems, River regulation, Streamflow, Regulation, Comprehensive planning, Land management, Governmental interrelations, State governments, Illinois, Administrative agencies.

The Little Calumet River Basin Commission (Commission) is established for the purpose of coordinating the development of the river basin and shall cooperate with the regional planning commission in the preparation of a comprehensive development plan for the basin. The activity of this Commission is limited to that part of the Little Calumet River Basin which begins at the point where Burns Ditch empties into Lake Michigan and runs southerly and westerly to the Indiana-Illinois state line. The Commission may conduct all necessary studies for the accomplishment of its duties. It may publicize and advertise its purposes, objectives, and findings; may provide recommendations when requested to the political subdivisions within the basin; and may act when requested as a coordinating agency for programs and activities of such agencies as they relate to its objectives. Moreover, the Commission may acquire and use such property as the Commission may deem necessary for the development in the corridor or contiguous areas. Also, the Commission may enter into agreements with duly constituted agencies in Illinois which are responsible for the planning and development of the entire Little Calumet River Basin in Illinois. Provisions relating to Commission membership, administration, and project financing are included. (Mockler-Florida)
W73-11983

GREAT LAKES RIVER BASINS COMMISSION.
Ind. Ann. Stat. secs. 68-1401 thru 68-1404 (Supp. 1972).

Descriptors: *Indiana, *Great Lakes, *River basin development, Water resources development, Water quality control, Planning, Land use, River basins, Water pollution control, *River basin commissions, Comprehensive planning, Administrative agencies, Governmental interrelations, State governments, Interstate commissions, St. Lawrence River, Optimum development plans.

The membership of the state of Indiana in the Great Lakes River Basins Commission, established by a presidential executive order, is ratified. The Indiana member of this Commission is to be appointed by the Governor for an indefinite period and the Department of Natural Resources shall provide administrative, technical and advisory services to the member. The functions and duties of the Commission are to serve as the principal agency for the coordination of federal, state, interstate, local and nongovernmental plans for the development of water and related land resources within those portions of the eight Great Lakes states which are or were in their natural state drained by the St. Lawrence River system; to prepare and keep up to date a comprehensive, coordinated joint plan; and to recommend long-range schedules of priorities for the collection and analysis of basic data and for investigation, planning, and construction of projects. The statutes also provide that the plans shall include an evaluation of all reasonable alternative means of achieving optimum development of water and related land resources of the basins. (Mockler-Florida)
W73-11984

ENVIRONMENTAL HEALTH (CONSTRUCTION SITE REGULATIONS).
Ind. Admin. Rules and Reg. secs. (40-2139)-L74 thru (40-2139)-L81 (Supp. 1972).

Descriptors: *Indiana, *Public health, *Sewage disposal, *Water quality standards, Water quality control, Water sources, Water supply, Water treatment, Waste treatment, Potable water, Safety, Environmental sanitation, Water purification, Administrative agencies, Administrative decisions.
Identifiers: *Administrative regulations, *Construction sites, Potable water standards, Toilet facilities, Washing facilities.

These provisions contain minimum requirements for sanitation and health on construction work sites. The rules cover drinking water standards, water sources, water supply standards for employee washing facilities, drinking water transportation and dispensing, non-potable water sources, water discharge points, toilet and washing facilities, and sewage disposal. The rules provide that the requirements outlined for sanitation and health are minimum requirements and shall not supersede, take precedence, or invalidate any rules,

regulations, orders, or directives of the Indiana state board of health or any other state or local agency that may be more stringent or additional to the requirements stated. An exception to the rules provides that for routine maintenance and repair and nonfixed construction work such as signal and line work, railroad and highway work, and pipeline work, the toilet and washing facilities and the sewage disposal facilities required by the regulations may be waived or varied by the commissioner of labor. (Mockler-Florida)
W73-11985

ENVIRONMENTAL MANAGEMENT.

Ind. Ann. Stat. secs. 35-5201 thru 35-5265 (Supp. 1972).

Descriptors: *Legislation, *Administrative agencies, *Indiana, Water quality control, Water pollution control, Public health, Sewage treatment, Legal aspects, Water resources development, Comprehensive planning, Waste disposal, Adjudication procedure, Administrative decisions, Permits, Law enforcement, Treatment facilities, Water supply, Penalties (Legal).
Identifiers: Administrative regulations.

The Indiana environmental management board (Board shall maintain a long term comprehensive plan for the development and control of the state's natural resources; adopt regulations to protect the environment; inspect refuse disposal sites, public water supplies and pollution sources; and assist local governments in developing programs for such actions as water pollution control. All powers and duties of the state board of health are transferred to the Board; other powers are expressly enumerated. Also included are provisions for Board membership, meetings, adopting rules and regulations and hearings. The Board may prescribe regulations for water wells, drainage holes and standards for waste discharges into waters of the state. Permits for the construction and operation of public water supply facilities and water pollution control facilities must be obtained from the Board. The Board is charged with investigating and enforcing violations of this Article. Provisions for hearings and appeals are included. (Mockler-Florida)
W73-11986

FLOOD CONTROL.

Ind. Ann. stat. secs. 27-1101 thru 27-1134 (1970).

Descriptors: *Indiana, *Legislation, *Flood control, *Flood protection, *Water resources development, Water management (Applied), Floods, Channel improvement, Civil engineering, Flood damage, Water policy, Flood proofing, Water resources, Legal review, Water conservation, Economics, Programs, Project planning, Administration, Legal aspects, Planning, Administrative agencies.
Identifiers: Nuisance (Legal aspects).

The duties and powers of the Indiana Flood Control and Water Resources Commission (Commission) are specified. The Commission has the power to commence, maintain and prosecute any appropriate action to enjoin or abate a nuisance which adversely affects flood control or the safety of life or property. To prevent and limit floods, all flood control works and structures, the alteration of watercourses of all rivers and streams are to be regulated, supervised and coordinated in design, construction and operation according to sound and accepted engineering practice. Channels and floodways are to be kept free of obstructions. Water resources are to be accumulated and preserved. A master plan for the entire state to control floods and preserve the water resources is to be prepared. A flood control revolving fund, from which loans may be made to municipalities, is established. Municipalities are authorized to institute flood control programs in cooperation with state policy and project planning. (Reed-Florida)
W73-11987

BENEFITED WATER DISTRICTS.

Iowa Code Ann. secs. 357.1 thru 357.34 (Supp. 1973).

Descriptors: *Iowa, *Water districts, *Legislation, *Water supply development, Legal aspects, Local governments, Governmental interrelations, Water policy, Water, Water rights, Assessments, Value, Taxes, Management, Administrative agencies, Water resources development, Project planning, Water utilization, Public benefits.

Upon the petition of 25% of the resident property owners, the County Board of Supervisors (Board), shall grant a hearing relative to the establishment of a water district. If the proposed district is to be located wholly within a city or town, the city or town council shall have the authority to establish the water district. If the preliminary design and assessment are approved by the County Board, a date for an election shall be set. The election shall be to determine whether the improvement shall be constructed, and to choose trustees for the district. After a final acceptance of the work by the Board, the engineer shall complete a final assessment based on all the property in the district. The Board of Supervisors may alter an assessment by increasing or decreasing it. Where a town or city is wholly within a benefited water district, the Board having jurisdiction of that district may convey it and all rights in and to it to that city or town. (Glickman-Florida)
W73-11988

UPPER MISSISSIPPI RIVERWAY COMPACT.
Iowa Code Ann. secs. 27A.1 thru 27A.6 (Supp. 1973).

Descriptors: *Iowa, *River basin development, *Legislation, *Interstate compacts, *Mississippi River, River basin commission, Natural resources, Rivers, Legal aspects, Legislation, Administrative agencies, Ecology, Recreation, Recreation facilities, Fishing, Social needs, Wildlife, Water resources, State governments, Governmental interrelations, Management, Public benefits, Public lands, Interstate rivers.
Identifiers: Public trust doctrine.

The Upper Mississippi Riverway Compact is established and entered into by all adjoining states. The purpose of the compact is to secure the benefits that can accrue from the preservation, use and development of the scenery, recreational opportunities, fisheries, wildlife, water resources and other natural assets of the river. The party states shall cooperate in preserving and protecting the natural and recreational resources of the area. The Upper Mississippi Riverway District (District) is established, to be managed by the Upper Mississippi Riverway Commission (Commission). The Commission shall have the power to operate all recreational facilities within the District and to conduct studies and develop recommendations for the protection, use, and development, in the public interest, of the lands and waters in and affecting the District. The Commission may acquire easements or make such agreements that may be suitable for establishing patterns of land and water use consistent with this compact. The Commission may enter into necessary agreements with any agency of the State of Iowa, but none of the functions of the Riverway District shall limit the powers of governmental units within the state. Provisions are included for the administration of the Commission and financing of Commission projects. (Glickman-Florida)
W73-11989

PROTECTION FROM FLOODS.

Iowa Code Ann. secs. 395.1 thru 395.35 (Supp. 1973).

Descriptors: *Iowa, *Condemnation, *Flood control, *Legislation, Watercourses (Legal aspects), Flood damage, Flood routing, Diversion structures, Flood protection, Structure, Levees, Floodways, Floodproofing, Bond issues, Right-of-way, Assessments, Governmental interrelations, Cities, Public health, Water management (Applied), Water policy, Financing, Project planning.

Cities and towns are authorized to establish a flood control system for the protection of property within their limits from floods and their effects. They may alter watercourses by improving and widening watercourses or other projects designed for flood control. Cities and towns may purchase or condemn private property as well as rights-of-way if it is necessary to carry out the provisions of this chapter. The title of all property condemned to establish a flood control system shall be taken in the name of the city or town; and, if the land is later sold, the proceeds shall be credited to the flood control system. To pay for the cost of contemplated improvements, bond issues are authorized. In addition, the cities and towns may accept federal aid in developing their systems. City Councils shall be allowed to allocate portions of the street fund to the project, as well as authorizing special assessments against real property. The work to be done may be divided into sections, and each section may be developed separately. Cities and towns are also authorized to issue bonds to pay expenses. (Glickman-Florida)
W73-11990

WATER QUALITY COMMISSION.
Iowa Code Ann. secs. 455B.30 thru 455B.74 (Supp. 1973).

Descriptors: *Iowa, *Water pollution control, *Water quality standards, *Waste water (Pollution), Administrative agencies, Legislation, Water quality, Regulation, Water pollution, Water policy, Water quality control, Public health, Pollution abatement, Waste water disposal, Waste water treatment, Law enforcement, Permits, Sewage treatment, Financing, Detergents, Legal review, Legal aspects, Personnel.
Identifiers: Licenses.

The Iowa Water Quality Commission (Commission) shall develop comprehensive plans and programs for the prevention, control and abatement of water pollution. It shall establish water quality standards for the water of the state, as well as develop rules specifying the conditions under which the Commission shall issue or deny permits for the installation or operation of disposal systems for the discharge of sewage or other wastes. The Commission shall implement rules governing the labeling of detergents which contain phosphorous. The Commission shall hold hearings on the implementation and enforcement of the rules it establishes. The Executive Director shall classify water treatment plants or water distribution systems in accordance with the skill and experience an operator must have to run the plant so as to protect the public health and prevent pollution, and every operator must be certified to handle his particular position. No plant shall operate except under the direction of a certified operator. The Commission shall administer the Sewage Works Construction Fund, giving consideration to the public benefit and ultimate cost of any project. (Glickman-Florida)
W73-11991

MILLDAMS AND RACES.

Iowa Code Ann. secs. 469.1 thru 469.31 (1971).

Descriptors: *Iowa, *Mill dams, *Water pollution control, *Legislation, *Legal review, Embankments, Regulation, Water policy, Dams, Environmental effects, Riparian rights, Public health, Permits, Water pollution, Water quality control, Industrial wastes, Mills, Legal aspects, Dam construction, Dam design, Administrative decisions, Administrative agencies, State governments, Water management (Applied).
Identifiers: *Races.

No dam shall be constructed or maintained in any navigable stream, or in any other stream for manufacturing or power purposes, nor shall any water be taken from such streams for industrial purposes unless a permit has been granted by the Iowa Natural Resources Council. Upon application for a permit and a hearing, if it appears that the dam will not obstruct existing navigation or affect other public rights, or endanger public health, the Council shall grant the permit. If water is to be used for manufacturing purposes, application must be approved by the Water Pollution Control Commission. The Natural Resources Council shall investigate means of constructing and maintaining dams so as to best conserve and protect all public and riparian rights. When the water backed up by a dam belonging to a mill is about to overflow the banks and injure machinery, the owner of the mill may repair the embankments to prevent the damage. Any person using a water power for the purpose of propelling machinery shall have the right to acquire the fall below such power. Specific provisions relating to the procedure for receiving a permit to construct a dam are included. Penalties for non-compliance with the chapter are also provided. (Glickman-Florida)
W73-11992

BIG CYPRESS PRESERVE, FLORIDA.

Hearings-Subcomm. on National Parks and Recreation–Comm. on Interior and Insular Affairs, U.S. House of Representatives, 92d Cong, 2d Sess, February 15 and September 26, 1972. 180 p.

Descriptors: *Watershed management, *Legislation, *Eminent domain, *Water management (Applied), Water quality control, Freshwater, Wetlands, Water supply, Water sources, Federal jurisdiction, Condemnation, Land management, Land use, Water conservation, Surface drainage, Swamps, Florida, Land development, Environmental effects.
Identifiers: *Environmental Impact Statements, *Big Cypress Swamp, *Congressional hearings, Everglades.

H.R. 10410 would authorize the Secretary of the Interior to acquire certain lands within the Big Cypress watershed in Florida; other bills would authorize the acquisition of the Big Cypress national fresh water reserve in Florida. The basic purpose of this field hearing was to hear testimony from people in the local area. Representatives of state and local agencies testified at this hearing with reference to these proposed bills. Upon passage, the Secretary of the Interior would be authorized to enter into an agreement with the state or local unit of government for the purposes of managing and administering the area. The use of the lands would be limited so as to assure the flow of fresh water into the park. The use of motorized vehicles, mineral exploitation, grazing, and agricultural pursuits would be closely regulated. Hunting and trapping would continue subject to reasonable controls. The aim of the proposal is to protect the fresh water resources in Big Cypress Watershed and thereby protect the water quality, quantity and flow regimen to the northwest portion of Everglades National Park, as well as the estuarine regions and the water supplies of the cities and towns in Southwest Florida. (Mockler-Florida)
W73-11993

DEEP DRAFT HARBOR AND TERMINAL AUTHORITY.

La. Rev. Stat. secs. 34:3101 thru 34:3114 (Supp. 1973).

Descriptors: *Louisiana, *Legislation, *Harbors, *Port authorities, *Environmental effects, Coastal structures, Transportation, Shore protection, Coastal engineering, Deep water, Regulation, Governmental interrelations, Navigation, Ships, Project planning, Comprehensive planning, Administrative agencies, Public benefits.
Identifiers: *Deep draft harbors.

The object is to provide for the creation of the Deep Draft Harbor and Terminal Authority (Authority) possessing full corporate powers, to promote, plan, finance, develop, construct, control, operate, manage, maintain and modify a deep draft harbor and terminal within the jurisdiction of this Authority in order to promote the economic welfare of state citizens and to provide the necessary facilities for docking, loading, and unloading of vessels carrying liquid or dry bulk and energy cargoes. Additional purposes include the promotion of port operations, the protection of environmental values and Louisiana's coastal marshland ecosystem, and the promotion of the industrial and petrochemical base of the Mississippi Valley region of the United States by providing adequate deep draft port facilities for the handling of the cargoes of deep draft vessels. Following a list of applicable definitions, the statutes cover jurisdiction, terms and qualifications of Board of Commissioners to govern the authority, board duties, annual reports, public contracts, and procedures for issuance of bonds. A detailed environmental protection plan is required to be prepared and followed in the carrying out of any Authority project. (Mockler-Florida)
W73-11994

JACKSON-BIENVILLE PARISHES DUGDEMONA WATERSHED DISTRICT.

La. Rev. Stat. secs. 38:3000 thru 38:3014 (Supp. 1973).

Descriptors: *Louisiana, *Legislation, *Watershed management, *Water yield improvement, *Water districts, Water conservation, Water use, Water utilization, Water management (Applied), Watersheds (Basins), Water supply, Water storage, Soil management, Soil conservation, Wildlife management, State governments, Area redevelopment, Project planning, Artificial lakes, Public benefits.

The Jackson-Bienville Parishes Watershed District (District) is created for the purpose of soil and water conservation, development of natural resources, and for the creation and maintenance of a lake for the benefit and health of the citizens of the state. The District shall constitute a body corporate and shall be a state agency. The District shall be governed by a Board of Commissioners, (Commissioners), who are empowered to buy and sell land, contract for projects, create administrative rules and regulations, and levy taxes in fulfilling their obligations under these provisions. Specific procedures relating to the imposition of taxes are set forth. The Commission is particularly directed to preserving and improving available fresh water supplies in the area encompassed by the newly created district; it is authorized to cooperate with other governmental agencies in areas such as recreational facilities, fish and wildlife management, and budgetary matters. (Dunham-Florida)
W73-11995

GREATER BATON ROUGE WATER CONSERVATION DISTRICT.
La. Rev. Stat. secs. 38:3051 thru 38:3057 (Supp. 1973).

Descriptors: *Louisiana, *Legislation, *Groundwater resources, *Water districts, *Water management (Applied), Administrative agencies, Regulation, Legal aspects, Comprehensive planning, Project purposes, Local governments, Water supply, Water yield, Water utilization, Water policy, Control systems, Subsurface waters, Encroachment, Water conservation, Ecology, Environmental effects.

The governing body of the parish of East Baton Rouge, Louisiana is empowered to create a special conservation district within the parish and a Water Conservation Commission (Commission) to administer and regulate such conservation district. The Commission is empowered to study groundwater conditions with the view of water conservation, particularly on the possible effects of salt water encroachment, and to determine ways and means of protecting groundwater conditions in all aspects, including depletion and detrimental salt water encroachment. Consideration shall be given to the requirements of industry, agriculture and domestic consumption. The Commission shall make appropriate recommendations for any preventive or remedial action. Provisions for the make-up of the Commission membership, expansion of the special conservation district to other parishes, cooperative agreements with other governmental units, and technical assistance are included. (Dunham-Florida)

KEHOE LAKE, TYGARTS CREEK, KENTUCKY (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Huntington, W. Va.

Available from National Technical Information Service, as EIS-KY-72-5290-F, $6.00 in paper copy, $1.45 in microfiche. May 12, 1972. 53 p, 2 map.

Descriptors: *Environmental effects, *Dam construction, *Kentucky, *Dams, *Flood control, Water quality control, Watershed management, Recreation, Public rights, Erosion, Reservoirs, Permits, Administrative agencies, Project planning, Project purposes, Flood routing, Forest management, Federal project policy.
Identifiers: *Environmental Impact Statements, *Kehoe Lake, Tygarts Creek (Ky).

The construction and operation of a dam and other facilities for flood control, recreation, fish and wildlife enhancement, and water quality control purposes is analyzed. The construction would affect Kehoe Lake and Tygarts Creek in Carter and Greenup Counties, Kentucky. Construction would regulate downstream flow, convert the stream and upland areas to a lake and change land use both downstream and in the lake area. Adverse environmental effects include loss of cropland and forest land and some types of biotic habitat, disruption of persons now residing on lands to be acquired, and temporarily increased erosion and sedimentation due to construction. Tax revenues from project lands would be lost until economic activity is increased by the project. Alternatives discussed are construction of other main stem reservoirs, construction of retarding dams on minor tributaries,

construction of local flood protection projects, diversion of flood waters, evacuation of the flood plain, regulation of the flood plain, and no development at all. Comments were received, among others, from the Bureau of Sport Fisheries and Wildlife, the Environmental Protection Agency and the Kentucky Department of Parks. (Smith-Adam-Florida)
W73-11999

RICHARDSON V. SCHNEIDER (ACTION INVOLVING DISPUTE AS TO OWNERSHIP OF PENINSULA WHICH JUTTED INTO LAKE).

298 A.2d 583 (N.H. 1972).

Descriptors: *Boundary disputes, *Boundaries (Property), *New Hampshire, *Judicial decisions, Legal aspects, Land tenure, Riparian land, Adjacent land owners, Adverse possession, Prescriptive rights.

Plaintiff landowner sued defendant adjacent landowner to determine the ownership of a peninsula which jutted into a lake bounding the landowner's property. The appeals court held that the evidence revealed the lower court's finding to be erroneous and remanded the case. The appellate court found that the boundary line between the plaintiff's and defendant's property hit the shore of the lake on the defendant's side of the peninsula and that as a result the peninsula, except for a small piece of land, belonged to the plaintiff. However, the court also found that the evidence supported the finding that the defendant, whose family had built and occupied a camp on the peninsula, had gained title to this land through adverse possession. The case was remanded for a further hearing as to the exact extent of the defendant's ownership of land through adverse possession. (Mockler-Florida)

MCMULLEN V. RAMSEY STOCK FARMS, INC. (LANDOWNERS RIGHT TO DRAIN BOTTOMLANDS OR NON-NAVIGABLE LAKE).
272 So.2d 844 (Fla. App. Ct. 1973).

Descriptors: *Reasonable use, *Florida, *Drainage, *Water control, *Water rights, Water law, Water policy, Judicial decisions, Legal aspects, Canals, Dikes, Ditches, Drainage engineering, Drainage systems, Recreation, Beds, Dry beds, Lake beds, Riparian rights, Wetlands.

Plaintiff landowners sought to restrain defendant landowner from ditching, diking and draining operations on a portion of an area known as Lake Levy. Levy Lake is not navigable; in fact, some evidence indicates that it is not actually a lake. The defendants were constructing the dikes and canals on their bottom lands in order to bring them under effective water control, and to use the controlled land to graze cattle. The plaintiffs use the lands mostly for hunting and fishing. The appellate court affirmed the trial court's decision for defendants and held that the actions of the defendants were not causing water to be drained from area bottom lands owned by the plaintiffs. In view of the fact that the actions of defendants were necessary for proper development of their lands and constituted a reasonable use of such lands, the diking and ditching operations were held not to unreasonably interfere with plaintiffs' rights. Plaintiffs had to go upon defendants' lands to reach any open waters anyway. (Glickman-Florida)
W73-12001

SOIL CONSERVATION.
Ark. Stat. Ann. secs. 9-901 thru 9-938 (Supp. 1971).

Descriptors: *Arkansas, *Erosion control, *Soil conservation, *Legislation, *Sediment control, Conservation, Erosion, Floods, Water resources development, Land use, Dams, Watershed management, Administration, Flood control, Land management, Administrative agencies.

In order to control and prevent soil erosion and floodwater and sediment damages, and to further the conservation, development, and utilization of soil and water resources and the disposal of water, it is necessary that land use practices contributing to soil wastage and soil erosion be discouraged and discontinued. Among the works of improvement and procedures needed are engineering operations such as the construction of terraces, terrace outlets, check dams, desilting basins, floodwater retarding structures, channel improvements, floodways, dikes, ponds, ditches, and the like. Provisions for the creation of soil conservation districts and plans, their governing bodies, adoption of improvement plans, and the mechanics of preliminary surveys are included. Moreover, guidelines for the levy and assessment of taxes, borrowing money, and security bonds are also provided for. All improvement plans shall be approved by and recorded with the appropriate county court. (Mockler-Florida)
W73-12002

WATER AND AIR POLLUTION CONTROL ACT.
Ark. Stat. Ann. secs. 82-1901 thru 82-1991 (Supp. 1971).

Descriptors: *Arkansas, *Legislation, *Water resources development, *Water pollution control, Environmental protection, Water quality control, Air pollution, Sewage disposal, Industrial waste, Public health, Water policy, Water management (Applied), Administrative agencies, Regulation, Comprehensive planning, Legal aspects, Legal review, Governmental interrelations, Ecology, Environmental effects, Financing.
Identifiers: *Air pollution control, Administrative regulations, Nuisance (Legal aspects).

In an effort to preserve and protect the quality of the Arkansas environment the Arkansas Water and Air Pollution Control Act was created to correct inadequate state control and regulation. The statutes cover the establishment of the Pollution Control Commission and its powers and duties, procedures for hearings and appeals, criminal penalties for various violations, operation of disposal systems, cooperation among agencies and political subdivisions, public nuisance, permit procedures with reference to disposal systems, authorization to make grants, and application procedures to receive grants. Also covered are revenue bonds, indenture provisions, maximum interest rates, execution of bonds, sources of repayment, tax exemptions, legal investments, disposition of bond sale proceeds, revenue bond redemption, and accelerated project funding . The statutes spell out the state's policy on air pollution and provide a framework for implementing the state's water and air pollution policies. The stated legislative intent indicates that the pollution of the waters in Arkansas from sewage, industrial waste, garbage, municipal refuse, and many other sources has created and is creating a hazard and danger to the public health of the people of Arkansas and that an emergency exists with reference to this problem. STATE WATER RIGHTS LAWS,
Virginia Polytechnic Inst. and State Univ., Blacksburg.
W. R. Walker.
Preprint No. 1908, American Society of Civil Engineers, National Water Resources Engineering Meeting, Washington, D.C., January 29-February 2, 1973. 12 p. Price: $0.50.

Descriptors: *Water rights, *Water allocation, *Prior appropriation, *Water law, Competing uses, Appropriation, Beneficial use, Legal aspects.
Identifiers: *Committee on Water Laws (ASCE).

The Committee on Water Laws of the Irrigation and Drainage Division of the American Society of Civil Engineers has suggested that states declare a water use policy. The Committee has developed a general statement for a recommended policy for adoption by the states. This policy declares that all water in its natural environment is part of the public wealth and that it is a natural resource subject to appropriation. Implicit in this statement is the declaration that the appropriation doctrine, as applied in the western United States, should be adopted by all states. This doctrine recognizes three distinct elements--diversion, reasonable beneficial use, and private property. This publication questions the desirability of accepting western water right appropriation doctrines universally and, to some extent, the desirability of the continued application of this doctrine in the West. For example, under present appropriation laws, the use of water for maintaining low streamflows to protect fish life and provide recreation was found not to be a valid appropriation because an actual diversion was not necessary. Many other problems exist in deciding the best possible beneficial use of desired diversions and in the length of time the appropriations are granted. (Poertner)

NATIONAL LAND USE POLICY: OBJECTIVES, COMPONENTS, IMPLEMENTATION.

Proceedings of a special conference sponsored by the Soil Conservation Society of America, November 27-29, 1972, Des Moines, Iowa. Soil Conservation Society of America, Ankeny, Iowa, 1973. 220 p, 4 fig, 9 tab, 56 ref. Price: $3.50.

Descriptors: *Land use, *Water resources, Urban land use, Planning, Environmental effects, Natural resources, Institutions.
Identifiers: Land use policy.

Important current issues and problems concerning a national land use policy are discussed by 18 public officials and experts on land use. The articles fall under four categories: (1) the need for a national land use policy and the objectives involved; (2) the components of a land use policy, including natural resources, human considera-

tions, water resources, economics, and transportation; (3) the implementation of land use policies and plans; and (4) some thoughts about the future, including the emerging role of the States. With respect to water-related aspects of land use policy emphasis is placed on the growing interface between water resource planning and land use. For example, although water resource development has dealt effectively with floods and drought more emphasis is required on problems related to land use such as water quality, fish and wildlife habitat, sedimentation and erosion, recreation, and ecological balance. This is particularly true in urban areas where land uses are subject to quick and extensive changes. (Elfers-North Carolina)
W73-12048

(A BILL TO BE ENTITLED: THE OIL POLLUTION COMPENSATION ACT OF 1973).

Senate Bill no 841, 93d cong, 1st Sess (February 8, 1973). 35 p.

Descriptors: *United States, *Liability, *Legislation, *Oil pollution, International law, Ships, Legal aspects, Water quality standards, Oil spills, Oil wastes, International waters, Oil, Water pollution sources, Damages, International commissions.
Identifiers: *Absolute liability.

The Oil Pollution Compensation Act of 1973 would implement the International Convention on Civil Liability for Oil Pollution Damage and the International Convention on the Establishment of an International Fund for Compensation for Oil Pollution Damage. The bill provides that the owner of a ship at the time of the incident, or where the incident consists of a series of occurrences, at the time of the first such occurrence, shall be liable for any pollution damage caused as a result of the incident. Moreover, it provides that it applies exclusively to pollution damage (other than preventive measures) caused on the territory, including the territorial sea, of the United States or of any foreign country which is party to the Liability Convention, and to preventive measures, wherever taken, to prevent or minimize such damage. The owner shall not be liable for pollution damages if he proves that the damage resulted from an act of war, hostilities, civil war or insurrection, was wholly caused by an act or omission done with intent to cause damage by a third party or was wholly caused by the negligence or wrongful act of any government or other authority responsible for the maintenance of various navigational aids. OZARK INDUSTRIES, INC. V. STUBBS TRANSPORTS, INC. (ACTION TO RECOVER FISH-KILL DAMAGES WHEN GASOLINE FROM OVERTURNED TRUCK FOUND ITS WAY INTO SPRINGFED TROUT POOL).

351 F. Supp. 351-364 (W.D. Ark. 1972).

Descriptors: *Arkansas, *Judicial decisions, *Negligence, *Groundwater movement, Trout, Legal aspects, Gasoline, Fuels, Water quality, Underground streams, Damages, Water pollution sources, Accidents, Fish farming.
Identifiers: *Strict liability.

Plaintiff trout farm operator sued to recover from the defendants gasoline truck driver and his employer for the loss of approximately 70,000 fish, allegedly killed when gasoline spilled from the truck following a traffic accident, percolated into a groundwater stream and flowed almost three miles into plaintiff's trout pool. The court initially determined that under Arkansas law, theory of strict liability was inapplicable to a right of recovery for death of fish from alleged contamination of trout pools when the gasoline and fuel oil were carried for such a long distance by subterranean waters and into the springfed trout pools. The court added that it was not a foreseeable consequence of the accident that the gasoline would percolate into subterranean waters and be carried into plaintiff's pond. As a result, the Federal District Court held that even if the driver was negligent, neither the driver nor his employer were liable for the death of plaintiff's fish. (Mockler-Florida)

A BILL TO ASSURE THE PUBLIC IS PROVIDED WITH AN ADEQUATE QUANTITY OF SAFE DRINKING WATER.

Senate Bill 433, 93rd Cong, 1st Sess, (1973). 33 p.

Descriptors: *United States, *Potable water, *Legislation, *Water quality standards, *Public health, Water policy, Water sources, Standards, Water pollution sources, Law enforcement, Water purification, Water treatment, Federal government, Domestic water, Water quality, Water supply.
Identifiers: *Safe Drinking Water Act of 1973.

S.433, the Safe Drinking Water Act of 1973, would assure that the public is provided with an adequate quantity of safe drinking water by issuing proposed regulations prescribing national primary and secondary drinking water standards. These standards are to be such that the attainment and maintenance of them are requisite to reasonably protect the public health. The addition of any substance other than for the purpose of treating contaminants is proscribed by the bill. These standards shall prescribe the maximum permissible levels for any contaminants which may exist in any public water system in the U.S. which may cause or transmit disease, chemical poisoning, or other impairments to man. Moreover, they may apply to any feature of the water supply system, including the treatment, storage, and distribution facilities. In addition, the standards shall include requirements for the adequate operation, maintenance, surveillance, and monitoring of water quality adequate to assure a dependable supply of drinking water. Also included are requirements for construction and site selection of public water system facilities so as to protect them from floods and other natural disasters. (Mockler-Florida)

FELTON V. HODGES (STATE'S AUTHORITY TO REGULATE COMMERCIAL FISHING BEYOND ITS TERRITORIAL WATERS).

374 F.2d 337-340 (5th Cir. 1967).

Descriptors: *Florida, *State jurisdiction, *Fish management, *Commercial fishing, *International waters, Fishing, Saline water fish, Judicial decisions, Jurisdiction, Governmental interrelations, Fish conservation, Constitutional law, Shellfish, Legislation, Commercial shellfish, Law enforcement.

Appellant's activities in violation of the state commercial salt water fishing laws resulted in his arrest and the confiscation of his equipment. The fishing may have been done outside the seaward boundary of the state's jurisdiction; appellant argued that state jurisdiction was improperly extended. Appellant maintained that any attempt whatsoever by the State of Florida to regulate his fishing outside its territorial boundaries was violative of his constitutional rights. The Fifth Circuit Court of Appeals found that Florida had sought by legislative enactment to extend the jurisdiction of its conservation officials to activities that occurred outside state territorial boundaries. The court held that such extension was constitutional because appellant was a citizen of the state which issued the law. A state with the requisite interest, and Florida had such an interest in crawfish which moved in and out of territorial waters, may subject its citizens to extra-territorial regulation in order to protect that interest. DISCHARGE OF UNTREATED WASTES INTO THE MISSISSIPPI RIVER.
La. Rev. State. sec. 56:1464.2 thru 56:1464.4 (Supp. 1973).

Descriptors: *Water pollution control, *Waste treatment, *Louisiana, *Legislation, Water pollution (Abatement), Waste disposal, Wastes, Regulation, Penalties (Legal), Disposal, Pollution abatement, Legal aspects, Legal review, Mississippi River, Water management (Applied), Water quality control, Water utilization, Water pollution sources, Water conservation, Water law.
Identifiers: *Civil liability, *Damages (Legal), Injunctions (Prohibitory).

This chapter provides for legal penalties against persons who willfully and intentionally discharge or cause to be discharged any untreated wastes into any body of public water in the state after December 31, 1972, with provisions for extention if reasonable progress is shown. Liability does not apply to the discharge of salt water or wastes produced in the course of operations for the exploration for or production of, oil, gas or other minerals. The provisions do not apply to any unintentional pollution or contamination resulting from or in connection with the production of agricultural products. Whenever, upon the sworn complaint of any person, it is made to appear that a violation has occurred or may be occurring, the District Court will order a hearing. A copy of the order will be served on the violator. If the court finds a violation has occurred or is occurring, it may assess a civil penalty not to exceed $10,000 for each day during which the violation has occurred and all costs of the hearing. If a violation is found to be continuing, the court may issue an injunction. The complainant must file a $100 bond to cover the hearing cost if the court finds no violation. No liability shall be incurred by complainant due to such filing of a complaint. (Napolitano-Florida)

PROPOSED FLORIDA FRONTIER RIVERS NATIONAL CULTURAL PARK.

Hearing--Subcomm. on National Parks and Recreation--Comm. on Interior and Insular Af-

fairs, U.S. House of Representatives, 92d Cong, 2d Sess, March 28, 1972. 45 p.

Descriptors: *National parks, *Florida, *Legislation, *Estuaries, Parks, Recreation facilities, National historic parks, Land use, Natural resources, Scenery, Conservation Aesthetics, Eminent domain, Preservation.
Identifiers: *Congressional hearings.

H.R. 586 would authorize the establishment of the Florida Frontier Rivers National Cultural Park. The purpose is to preserve the Nassau River estuary and associated cultural and historic sites and buildings of northeastern Florida so as to encourage public understanding and appreciation of the heritage fashioned by the past and present interaction of man with this environment. The three estuarine rivers of northeastern Florida unify a nationally significant cultural heritage and, in addition, posses important scenic, natural, ecological, scientific, and other values contributing to public enjoyment and scientific study. The proposed legislation also provides for the designation of additional sites of non-federal ownership for incorporation within the proposed park. The park would comprise 85,000 acres of lands and waters with ownership divided between the federal, state, and local governments. Nearly all of the testimony offered favored passage of the bill. (Mockler-Florida)

DESIGNATING ROCK CREEK IN MONTANA AS PART OF THE WILD AND SCENIC RIVERS SYSTEM.

Hearing--Subcomm. on Public Lands--Comm. on Interior and Insular Affairs, U.S. Senate, 92d Cong, 2d Sess, August 29, 1972. 60 p.

Descriptors: *Montana, *Legislation, *River systems, *Wild River Act, Rivers, Fishing, Conservation, Natural resources, Preservation, Legal aspects, National recreation areas, Planning, Water law.
Identifiers: *National Wild and Scenic River System, *Congressional Hearings, *Rock Creek, Mont.

S. 2132 would amend the Wild and Scenic Rivers Act so as to designate Rock Creek in Montana as a component of the national wild and scenic rivers system. The subcommittee heard statements by interested individuals and representatives of concerned organizations. Representatives of various state agencies and a state senator also made their views known to the subcommittee. Rock Creek gained a reputation as an outstanding sport fishing stream. As a result many dwellings have been built along its banks; these dwellings now represent a major pollution threat. Furthermore, this development is ruining the aesthetic quality of the river. For this reason some feel strongly that the river should be preserved in its natural state. On the other hand, a representative of the Missoula, Montana Chamber of Commerce expressed the opinion that further action on the bill be deferred until a current U.S. Forest Service study of the creek is completed. (Reed-Florida)
W73-12207

UNION DRAINAGE DIST. NO. 1 V. SPECIAL DRAINAGE DIST. (ACTION BY DRAINAGE DISTRICT TO IMPOSE LIABILITY ON ADJOINING DRAINAGE DISTRICTS TO BEAR SHARE OF COST OF CLEAN-OUT WORK ON DITCHES IN THE DISTRICT).

295 N.E.2d 91-96 (2d D.C.A. Ill. 1973).

Descriptors: *Illinois, *Drainage programs, *Judicial decisions, *Drainage districts, Legal aspects, Jurisdiction, Drainage systems, Ditches, Water management (Applied), Flow control, Cost sharing.

Plaintiff drainage district sued to have defendants adjoining drainage districts bear a just proportion of the costs of a projected clean-out work on ditches in the plaintiff district. The Illinois Appellate Court held that the adjoining districts had presented sufficient evidence to show that they would receive no benefits from the projected work and that therefore they were incorrectly assessed. This was so despite the fact all three districts involved were located in the same watershed and all of the water from the adjoining districts' ditches emptied into and through the plaintiff district's ditch. The court emphasized that in order to be assessed for a drainage project, the lands must be rendered more productive, more accessible, or the market value substantially increased and their actual or intrinsic value enhanced. The mere fact that the flow of water has or will be accelerated is not of sufficient benefit to justify an assessment for a drainage project. (Mockler-Florida)

CITIZENS FOR CLEAN AIR, INC. V. CORPS OF ENGINEERS, U.S. ARMY (PUBLIC HEARING NOT REQUIRED UNDER THE NEPA).
356 F. Supp. 14-21 (S.D. N.Y. 1973).

Descriptors: *United States, *Legal review, *Administrative decisions, *Judicial decisions, *Environmental effects, Waste water (Pollution), New York, Water pollution, Water quality, Waste water disposal, Legal aspects, Permits, Project planning, Water quality, Adjudication procedure, Hydroelectric plants, Administrative agencies, Legislation, Federal Water Pollution Control Act.
Identifiers: *National Environmental Policy Act, *Environmental Impact Statements.

Plaintiffs private citizens moved for an order enjoining the defendant utility company from proceeding with the construction of a water intake and discharge facility, and to enjoin the defendant Army Corps of Engineers from issuing any permit in connection therewith. Plaintiffs contended that the Corps' refusal to hold a public hearing on the environmental impact statement being prepared as a precondition to issuance of the permit was in violation of the National Environmental Policy Act (NEPA) and of due process at law. The United States District Court for the Southern District of New York held that NEPA does not require the holding of a public hearing, and that even if the Corps' regulations required such a hearing, it is not required to be held before the impact statement is completed. The Court therefore dismissed plaintiff's motion. (Reed-Florida)

EXPLOITATION OF SEABED MINERAL RESOURCES--CHAOS OR LEGAL ORDER,
J. Dombroski.
Cornell Law Review, Vol 58, No 3, p 575-601, March 1973. 149 ref.

Descriptors: *Beds under water, *Mineral industry, *Oceans, *International law, Continental shelf, Legal aspects, Exploitation, Governments, United Nations, Jurisdiction, Mining, Exploration, Beds, Law of the sea, Treaties, International commissions, International waters.

The need for new order in the international seabed becomes increasingly intense as technology continues to march seaward. A new legal order in the seabed must provide for a system which guarantees mutual recognition of and non-interference with various extractive activities and which provides mechanisms for the peaceful settlement of disputes. Present defects in the international framework are pointed out; the exploitability criterion of the Geneva Convention is both indeterminate and outmoded as a limit on national jurisdiction. As an example, the United States has already issued exploration permits for areas of the sea lying 300 miles from the coast and at depths ranging up to 1,525 meters. Existing seabed controls may lead to creeping jurisdiction, not only outward from the coast, but also vertically through the water column. The fear exists that the lack of legal order in the seabed will slowly erode the area of high seas as nations claim greater preferential rights. Further, unregulated national exploitation of the seabed may lead to new levels of international strife and conflict. (Mockler-Florida)

ENVIRONMENTAL LAW--EXPANDING THE DEFINITION OF PUBLIC TRUST USES,
M. Smythe.
North Carolina Law Review, Vol 51, No 2, p 316-325, December 1972. 54 ref.

Descriptors: Easements, *Judicial decisions, *Public rights, *Flood plain zoning, Wetlands, Legal aspects, Constitutional law, Coastal marshes, Land use, California, New Jersey, Wisconsin, Land development, Water rights, Legislation, State governments, Intertidal areas.
Identifiers: *Public trust doctrine, Coastal zone management, Inverse condemnation.

One problem faced by legislatures when attempting to control the use of coastal wetlands is that by attempting too much regulation they may encroach upon property owners' rights protected by the fifth amendment's prohibition against taking property without just compensation. A recent case in California held that an individual's ownership of tidelands is burdened with a public trust easement. Thus, the landowner was prohibited from constructing a marina on his tidelands. This case provides one means of avoiding inverse condemnation problems in regulating wetlands. New Jersey joined California in expanding the public trust doctrine when its Supreme Court decided that the public trust doctrine prohibited municipalities from charging higher rates to non-residents than to residents attempting to use the city's beaches. Plaintiffs had not argued the public trust as a theory of recovery; however, the court supplied the rationale on its own. There is room for abuse if the government carries the public trust doctrine too far; thus, there must be limits to the type of use the government wishes to make of its easement. Fairness dictates that this doctrine should only be used as a stopgap approach to the prevention of wetlands destruction. (Mockler-Florida)
W73-12211

OIL AND GAS--RIGHTS OF MINERAL LESSEE IN USE OF SURFACE OWNER'S FRESH WATER FOR SECONDARY RECOVERY PURPOSES, SUN OIL V. WHITAKER.

Land and Water Law Review, Vol 8, No 1, p 175-183, 1973. 38 ref.

Descriptors: *Leases, *Easements, *Competing uses, *Water rights, *Texas, Judicial decisions, Mineral industry, Legal aspects, Exploitation, Groundwater mining, Groundwater resources, Wells, Irrigation.

A decision is analyzed of the Texas Supreme Court dealing with the rights of a mineral lessee to use the surface owner's fresh water for secondary recovery purposes. This case is apparently the first state decision granting the lessee as the owner of the dominant estate an implied easement to use fresh water resources owned by the surface estate landowner in such manner that the surface estate landowner would be substantially and irreparably injured. The mineral estate is dominant because the lessee's rights to use the surface estate are superior to those retained by the lessor insofar as necessary to the full enjoyment of the mineral grant. A previous case had limited this relationship by saying that the mineral lessee cannot make unreasonable use of the surface estate. In the absence of a showing of adequate consideration paid by the mineral lessee for his substantial taking

of the surface estate, the courts should not attempt to transfer a valuable property interest without clear evidence that this was the intent of the parties. (Mockler-Florida)

DRAINAGE LAW IN NORTH DAKOTA: AN OVERVIEW,
North Dakota Univ., Grand Forks. School of Law.
R. E. Beck, and B. E. Bohlman.
North Dakota Law Review, Vol 47, No 4, p 471-513, Summer 1971. 255 ref.

Descriptors: *North Dakota, *Drainage, *Drainage practices, *Surface drainage, *Drainage districts, Legal aspects, Governments, Drainage systems, Farm management, Surface runoff, Water control, Drainage programs, Adjudication procedure, Administrative agencies, Common law, Judicial decisions, Reasonable use, Watershed Protect, and Flood Prev. Act, Legislation, Natural flow doctrine.
Identifiers: Common enemy rule.

This comprehensive analysis of drainage law in North Dakota surveys the substantive common law and institutional law as it now exists in North Dakota in relation to drainage, and attempts to indicate some of the gaps that exist. The institutional law discussion focuses on Drain Board projects and recognizes that other local authorities may also sponsor drainage projects. It does not explore in any depth the role of the State Water Commission in drainage. The judicial decisions rendered on drainage are not entirely reliable since the applicable statutory provisions have been subsequently revised in scope and meaning. Drainage in North Dakota is characterized by a misconception as to the value of drainage installation so far as agricultural lands are concerned because in many instances, the assumed benefits never materialized. The flexible common law and the institutional approach work hand in hand. The institution can frequently act as mediator between differing parties without having to assert its drainage powers. (Mockler-Florida)

WATER POLLUTION CONTROL.

Congressional Record, Vol 119, No 9, p 1016-1018 (daily ed.) January 18, 1973.

Descriptors: *Federal Water Pollution Control Act, *Agriculture, *Pollution abatement, *Legislation, *Water pollution control, Legal aspects, Industrial wastes, Liquid wastes, Waste disposal, Waste water disposal, Water pollution, Water reuse, Waste treatment, Permits, Grants, Treatment facilities, Water quality standards, Water pollution sources.
Identifiers: Environmental Protection Agency.

Introduced into the Congressional Record was an article by the President of American Agribusiness Associates commending federal attempts at pollution control, particularly the 1972 Federal Water Pollution Control Act (FWCA). Modern agriculture was challenged to aid in assuring a quality environment. Agriculture contributes more waste than mineral, industrial or residential sources; the problem is accentuated by the wastes resulting from modern efficient agricultural techniques. The 1972 FWPCA is particularly important in that it gives the Environmental Protection Agency authority to require firms discharging pollutants into waters to meet water quality standards, and to preempt state minimum effluent levels with more effective guidelines established by the EPA. The FWPCA is discussed in relationship to its effect on agricultural industries such as poultry slaughtering plants. (Glickman-Florida)

LOUISIANA COASTAL COMMISSION.

La. Rev. Stat. secs. 34:2251 thru 34:2253.1 (Supp. 1973).

Descriptors: *Louisiana, *Legislation, *Water management (Applied), *Multiple purpose projects, *Coastal plains, Coastal marshes, Saline water intrusion, Coastal engineering, Administrative agencies, Administrative decisions, Regulation, Project planning, Water allocation (Policy), Water policy, Water resources development, Flood control, Navigation, Freshwater, Water pollution control, Water yield improvement, Wildlife conservation, Drainage, Environmental effects.
Identifiers: *Administrative regulations, *Coastal zone management.

The Louisiana Coastal Commission, (Commission), is established as a political subdivision of the state and body corporate. The Commission replaces the abolished Louisiana intracoastal Seaway Commission. The Commission is to be administered by a Board of Commissioners, (Board), with provisions set forth as to membership on the Board and their authority to establish rules necessary to regulate the Commission. The Commission is empowered to plan, establish, construct, own, operate, and maintain: (1) a system of navigation channels to improve navigation conditions for water traffic; (2) structures necessary to preserve and increase fresh water supply; (3) structures to provide fresh water systems and wildlife habitat; (4) structures to prevent salt water intrusion from the Gulf of Mexico; and (5) structures to improve drainage for flood control. In furtherance of these goals, the Commission is authorized to levy taxes to finance projects. The area of the Commission's jurisdiction is limited to specific parishes along the Louisiana coast. (Dunham-Florida)
W73-12217

SAVE OUR TEN ACRES V. KREGER (STANDARD OF JUDICIAL REVIEW OF AGENCY ACTION UNDER NEPA).

472 F.2d 463-468 (5th Cir. 1973).

Descriptors: *United States, *Legal review, *Administrative decisions, *Judicial decisions, *Environmental effects, Flood plains, Ecology, Enviromental control, Air pollution, Legal aspects, Flood plain zoning, Construction, Legislation, Administrative agencies.
Identifiers: National Environmental Policy Act, Environmental Impact Statements.

Plaintiff appellant was a voluntary unincorporated association which sought to enjoin the construction of a federal office building. Appellant contended that the General Service Administration (GSA) failed to comply with the National Environmental Policy Act when it failed to file an environmental impact statement regarding the site selection for the office building. Appellant also contended that construction of the building would aggravate a substantial air pollution problem and would be improperly located in a flood plain. Appellee answered that there was no need to file a statement because the construction would not significantly affect the quality of the human environment. The trial court had refused to grant relief, holding that the decision of the GSA to not file an impact statement could not be overturned unless it was found to be arbitrary, capricious or an abuse of discretion. The Fifth Circuit Court, while not going to the merits of the claim, reversed and remanded directing that the more relaxed standard of reasonableness rather than arbitrary or capricious be used by the court in reviewing the decision of the GSA to not file an impact statement. (Glickman-Florida)

CONSCIOUSNESS OF STREAMS: THE 1971 ALABAMA WATER POLLUTION CONTROL ACT.

Alabama Law Review, Vol 24, No 3, p 737-776, Summer 1972. 40 p, 251 ref.

Descriptors: *Alabama, *Administrative agencies, *Water pollution sources, *Legislation, *Water pollution control, Industrial wastes, Legal aspects, Water quality control, Tennessee Valley Authority, Sewage effluents, Waste disposal, Federal Water Pollution Control Act, Penalties (Legal), Law enforcement, Adjudication procedure, Mine wastes, Agricultural runoff, Thermal pollution, Water quality standards, Governments.
Identifiers: *Alabama Water Pollution Control Act, Administrative regulations.

The 1971 Alabama Water Pollution Control Act created a Water Improvement Commission. Unlike a previous commission, members of the new Commission may not be connected with industry. Those 'persons' subject to restrictions of the Act include individuals, public corporations, any form of business and municipal corporations; it does not include the federal government, the state, counties and probably the Tennessee Valley Authority. All waters of the state, whether non-navigable or navigable, underground or surface, are covered by the Act. A definition of pollution is included in the Act, however, the Commission may by regulation amplify or restrict the definition. Provision for penalties are also discussed. The major sources of water pollution in Alabama are: strip mining, animal manure, thermal pollution, radiation, vessels, sewage and industrial wastes. The effectiveness of the Act depends upon the promulgation of adequate regulations by the Commission for such things as effluent limitations and water quality standards. The legislature has attempted to create an unbiased commission and has given it adequate legal powers and discretionary authority to fill the interstices of the statute. (Mockler-Florida)

WATERCOURSES--CANALS--TOLL BRIDGES,

Ind. Ann. Stat. secs. 26-1413 thru 26-1417 (1970).

Descriptors: *Indiana, *Legislation, *Canals, *Channel improvement, Navigation, Flow, Conveyance structures, Transportation, Local governments, Canal construction, Repairing, Streams, Bridges, Channels, Administration, Economics, Planning, Financing, Open channels, Legal review.
Identifiers: *Canal repair, *Toll bridges, Navigation obstructions.

It is unlawful for the Board of Commissioners, (Commissioners), of any county in Indiana in, through, along, or by which passes any canal, which is now used for the purpose of navigation, to appropriate out of the county treasury any amount of money not exceeding $10,000, to aid in putting or keeping in repair any such canal for the purposes of navigation. The Commissioners may purchase any toll bridge or buy any private interest therein. A provision is also made in the statute for the straightening or clearing of channels of non-navigable streams by the couty commissioners upon a petition of 51% of landowners whose frontage lies between any two public bridges or other points designated in the petition. (Reed-Florida)
W73-12221

DRAINAGE MAINTENANCE AND REPAIR DISTRICTS.

Ind Ann Stat secs 27-243 thru 27-250 (1970).

Descriptors: *Indiana, *Legislation, *Drainage districts, *Drainage programs, Water management (Applied), Land management, Flood control, Financing, Repairing, Maintenance, Drainage, Drainage systems, Drains, Ditches, Legal aspects, Project planning, Regulation, Legal review, Administrative agencies, Administrative decisions.

In all cases where a public ditch or drain has already been or shall hereafter be constructed, a specified percentage of the owners of the real estate assessed who would benefit by the construction of such ditch or drain may file a petition in the appropriate court praying for the establishment of a Drainage Maintenance and Repair District, (District). The requirements that must be met and the procedures to be followed for the establishment of the District are specified. If the court approves the petition, it will establish a commission composed of landowners within the district to administer the District. The commission is to keep and maintain such ditches and drains in proper condition and has full power and authority to hire all such labor, purchase all such material and do all such acts as are necessary and incident thereto. Provision is made for the dissolution of the District upon the petition of a specified percentage of the landowners within the District. Affected landowners may request a hearing on establishment of a district or on projects approved by the commissioners. (Reed-Florida)
W73-12222

DRAINS AND WATERCOURSES AFFECTING HIGHWAYS.
Ind Ann Stat secs 27-407, 24-408 (1970).

Descriptors: *Indiana, *Legislation, *Flow control, *Water control, *Road construction, Channel improvement, Highways, Embankments, Highway effects, Flow, Drains, Ditches, Streams, Bridges, Drainage systems, Administration, Planning, Governmental interrelations, Project planning, Rights-of-way, Erosion control, Slope stability.

The governing bodies or agencies of the state of Indiana charged with the duties of the construction, maintenance and repair of public highways shall have the power to change the course of any stream, watercourse or drainage ditch, or to restore to its original or former channel any stream, watercourse or drainage ditch in case it has wandered from its original or former course. Such bodies or agencies may also do such construction work as may be necessary to protect the banks or slopes of any such stream, watercourse or ditch in the event that the waters of any such stream, watercourse or ditch are causing or threatening injury to any public highway or bridge. If the proposed work of any such state agency conflicts with the jurisdiction of a federal agency, the consent or waiver of such federal agency shall be procured before the beginning of the proposed work. The means of accomplishing the purposes of this act by the proper agency, the procedure therefor, and the method of paying the costs thereof are provided for in the statute. (Reed-Florida)

Descriptors: *Indiana, *Legislation, *Water levels, Lakes, Drainage programs, Drainage systems, Freshwater, Administrative agencies, Dams, Levees, Drainage, Drainage area, Ditches, Drainage districts, Drains, Legal aspects, Administration, Planning, Permits, Water law, Economics, Project planning, Assessments, Legal review.
Identifiers: *Freshwater lakes.

It is unlawful to establish, order or construct any ditch or drain cutting into, through or upon the line of any freshwater lake or to in any way construct a ditch or drain having a bottom depth lower than the level of the lake as established by law. This act applies to all drainage projects that are to be constructed, whether they are in the nature of alterations, changes or other improvements, as well as to the construction of new ditches and drains. It is unlawful to interfere with any dam, bank or levee or to lower the water level, with certain exceptions, of any artificial lake. It is unlawful to construct or repair any ditch or drain having a specified bottom depth without first having received the permission of the Indiana Department of Conservation, (Department). The Department is authorized to establish the average water levels for all lakes and to construct, sponsor and supervise all works necessary to maintain that level. The act makes provision for the procedures necessary for the Department to fulfill these functions including legal review of project plans and liability for violations of the act. (Reed-Florida)

Whenever the council of a city located in a county within a specified population range adopts legislation in favor of the establishment of a Levee Authority District, (District), under the provisions of this act, for the purposes of acquiring land, rights-of-way and easements on which the Board of the District or the United States Army Corps of Engineers can construct, improve, maintain, equip, control, lease and regulate levees to hold back flood waters, such District, conterminous with the jurisdictional boundaries of the councils enacting such legislation, will be established. The composition of the board as well as its powers and duties are specified. The Board of any District is authorized to exercise the power of eminent domain and issue general obligation bonds to meet the financial needs of the Board. Specific provisions dealing with administration, regulation and financing District projects are included. (Reed-Florida)

GROUNDWATER CONSERVATION.
Ind Ann Stat secs 27-1301 thru 27-1316 (1970).

Descriptors: *Water supply development, *Indiana, *Legislation, *Groundwater resources, *Well regulations, Groundwater, Water pollution, Water management (Applied), Water policy, Water quality control, Groundwater availability, Groundwater mining, Water sources, Water supply, Water wells, Wells, Water conservation, Water resources, Legal aspects, Administration, Regulation, Planning, Permits, Penalties (Legal).
Identifiers: *Administrative regulations.

It is declared to be the public policy of the state of Indiana to conserve and protect its groundwater resources. The Indiana Department of Conservation, (Department), may designate certain areas where the withdrawal of groundwaters exceeds or threatens to exceed its natural replenishment as restricted use areas. In such areas, it is unlawful, except under certain circumstances, for any person or group except public utilities to withdraw or use for any purpose groundwater in excess of a specified amount per day. All well owners in restricted areas must file with the Department a complete record of all new wells drilled in the area. The Department has the authority to require waste control measures and to require owners of flowing waterwells to reduce the flow of such wells. A per-

mit must be obtained from the Department to introduce potable groundwater into any underground formations which contains nonpotable water. The Department is authorized to adopt such rules and regulations as may be necessary to determine quantities of water being removed from the ground or for administering any provisions of this act. Penalties for any violations of this act are provided. (Reed-Florida)

ENVIRONMENTAL POLICY.

Ind Ann Stat secs 35-3501 thru 35-5308 (Supp. 1972).

Descriptors: *Environmental control, *Water resources development, *Indiana, *Legislation, *Environmental effects, Decision-making, Planning, Public health, Water pollution control, Administrative agencies, Regulation, Comprehensive planning, Ecology, Pollution abatement, Natural resources, Standards, Social aspects, Water resources development.
Identifiers: *State policy.

The purposes are to declare a state policy which will encourage productive and enjoyable harmony between man and his environment, to promote efforts which will prevent or eliminate damage to the environment and bioshere and stimulate the health and welfare of man, and to enrich the understanding of the ecological systems and natural resources important to the state of Indiana. The statutes provide that all agencies of the state shall utilize a systematic, interdisciplinary approach which will insure the integrated use of the natural and social sciences and the environmental design arts in planning and decision-making which may have an impact on man's environment, identify and develop methods and procedures which will insure that presently unquantified environmental amenities and values may be given appropriate consideration in decision-making, and include in every recommendation or report on proposals for legislation and other major state actions significantly affecting the quality of the human environment a detailed statement on the environmental impact of the proposed action. All state agencies are to review present statutory authority, regulations, policies and procedures and propose changes to comply with the provisions of this chapter. (Mockler-Florida)

INDIVIDUAL DRAINAGE RIGHTS.

Iowa Code Ann secs 465.1 thru 465.35 (1971).

Descriptors: *Iowa, *Legal review, *Drainage systems, *Legislation, Drainage, Drainage practices, Drainage programs, controlled drainage, Drainage effects, Tile drainage, Drainage area, Water policy, Surface waters, Mine drainage, Right of way, Easement, Legal aspects, Agriculture, Flood control, Local governments, Administrative decisions, Public benefit, Damages, Outlets.
Identifiers: *Drainage rights.

When any landowner desires to construct any drainage system for agricultural or mining purposes or for securing more complete drainage across the land of another, the right of way of a railroad or a highway, he must file an application with the County Auditor. The auditor will then set a hearing date before the County Board of Supervisors (Board) and serve notice on the party whose land is to be used. Any landowner claiming damages must file his complaint with the auditor prior to the hearing. The Board shall hear the application on the merits to determine if the project is beneficial. Before constructing the drain, the applicant shall pay any damages awarded to the party through whose land the drain will be constructed. Any person who shall obstruct or damage any drain shall be liable to the owner. The Board shall also decide any disputes between adjoining landowners whose property is divided by any watercourses or natural drainage line. Specific provisions relating to hearing procedures and appeals are included. There are also provisions concerning special procedures to be followed when drainage construction affects railroad and public highway rights-of-way. (Glickman-Florida)

POLLUTION OF WATERS OF STATE.

Ind Admin Rules and Reg Ann secs (68-523)-1 thru (68-523)-10 (Supp. 1970).

Descriptors: *Indiana, *Water pollution control, *Water quality, *Water quality standards, Public health, Industrial wastes, Water quality control, Lake Michigan, Bacteria, Waste disposal, Turbidity, Oil, Solid wastes.
Identifiers: *Administrative regulations, Little Calumet River.

These administrative rules and regulations provide for water quality standards and criteria for Lake Michigan open water and shore water, Lake Michigan inner harbor basin, Indiana harbor canal, the Grand Calumet River, Wolf Lake, and the Little Calumet River flowing into Illinois. All waters of the state must be free from substances attributable to municipal, industrial, agricultural or other discharges that will settle to form putrescent or otherwise objectionable deposits and free from floating debris, oil, scum and other floating materials attributable to municipal, industrial, agricultural or other discharges in amounts sufficient to be unsightly or deleterious. Furthermore, all waters must be free of substances in such degree as not to create a nuisance and free from substances or other discharges in concentrations or combinations which are toxic and harmful to human, animal, plant or aquatic life. Criteria for oils, solid wastes, bacteria, BOD count and other elements are provided for each body of water. (Mockler-Florida)

ANNUAL REPORT 1972.
Delaware River Basin Commission, Trenton, N.J.

1972. 29 p, 2 fig, 35 photo, 2 tab.

Descriptors: *Water resources planning, *Water quality control, *Regional development, *River basin development, *Delaware River Basin Commission, Environmental effects, Recreation, Planning, Maryland, New Jersey, New York, Delaware, River basins, *Delaware River.
Identifiers: Tocks Island, Hurricane Agnes, Schuylkill River.

The 10th Annual Report includes a summary of the first decade, reports on various on-going programs, an article on the floods that struck the river basin, particularly Hurricane Agnes, and an outline of a new unit of the Commission. The new unit is to deal exclusively with matters of environmental quality and be responsible for complying with the national Environmental Policy Act. Reports on existing programs include the water quality program to clean up the Delaware River estuary, the Tocks Island reservoir and park project and planning for the Schuylkill River sub-basin. Some of the significant areas of involvement of the Commission in the past decade include emergency authority and programs during the severe drought of the mod-1960's, cooperative policies for uniform water quality standards in the basin, the cleanup of the estuary, controls over groundwater, flood hazard mapping and information, power plant siting, and recreation. These program areas and others are carried on largely at a regional scale and are closely related to the strong urban nature and demands in the basin. (Elfers-North Carolina)

US-USSR EXPERTISE EXCHANGE,
W. S. Butcher.
Water Spectrum, Vol. 5, No. 1, p. 17-24, 1973.

Descriptors: *United States, *Water resources development, *Comprehensive planning, *Irrigation projects, Irrigation canals, Drainage, River systems, River training, Salinity, Water pollution, Dams.
Identifiers: Golodnaya Steppe, Kara Kum, Caspian Sea, *USSR.

Water resources has been identified as one of the needed activities between the U.S. and the U.S.S.R. While their irrigated land is less in acreage that in the U.S., the Soviets are working to increase acreage of new irrigated land. Particular reference is made to the Soviets' arid lands projects, especially those in the Golodnaya Steppe where attention is increasingly paid to problems of drainage, irrigation hardware, and automated irrigation practices; and in the Kara Kum Desert where the great water diversion canal is now 500 miles in length and will be double that when it reaches the Caspian Sea in approximately 1980. There is brief mention of the several river reversal projects, some of which are designed to restore the level of the Caspian Sea to overcome problems of increasing salinity and industrial pollution, as well as a decreasing fish harvest. The Soviet stage of water resources development is likened to U.S. recent past, except that their projects are on a larger scale. Little environmental concern is evident to date in the U.S.S.R. (Paylore-Arizona)

THE CHANGING DECISION RULES IN THE POLITICS OF WATER DEVELOPMENT,
Arizona Univ., Tucson.
H. Ingram.
Water Resources Bulletin, Vol 8, No 6, p 1177-1188, December 1972. 1 tab, 12 ref.

Descriptors: *Water resources development, *Political aspects, *Water policy, *Decision making, Federal government, Social impact, Environmental effects, Water resources, State governments, Evaluation, Multiple purpose projects, Economic impact, Project benefits, Projects, Financing, Budgeting, Cost-benefit ratio, Economic feasibility, Ecology.

Policy makers concerned with selecting potential water projects to be authorized and funded for construction have customarily applied a common set of decision rules to minimize the cost of decision making. These rules are identified, their operation described, and the logic behind adoption explained. The 5 decision rules are: local support, agreement, mutual accommodation, mutual noninterference, and fairness and equity. These guidelines are intended to ensure support, lessen conflict, and protect the reputation of water development as a worthwhile Federal investment. Currently, conflict has greatly increased the cost of the decision-making process to the Federal agencies which must spend the time, energy, effort, and influence to resolve differences among interest groups. Since current indications are that the traditional rules are no longer followed, an attempt has been made to identify changes in the rules. The question remains whether current revisions of decision rules will lessen the intensity of conflict. Today, Federal agencies are spending more energy to increase public participation in the

decision-making process. However, even with all the impacts displayed and points of view heard, Federal agencies doubt that a water development program of past magnitude can be recreated. (USBR)

W73-11978

LEGAL PROBLEMS IN REGULATING FLOOD HAZARD AREAS,
National Water Commission, Arlington, Va.
E. Liebman.
Preprint No. 1869, American Society of Civil Engineers, National Water Resources Engineering Meeting, Washington, D.C., January 29-February 2, 1973. 26 p, 25 ref. Price: $0.50.

Descriptors: *Flood protection, *Non-structural alternatives, *Legal aspects, *Flood plains, Flood plain zoning, Flood insurance, Levees, Floods, Floodproofing, Channel improvement, Regulation.

Flood hazard areas along rivers require both structural and nonstructural protection. Structural devices, such as dams, levees, flood proofing, and channelization are often not adequate by themselves. Nonstructural methods include items such as flood plain zoning, flood insurance and tax adjustments. The lawyer and the engineer have important complementary roles in the management of flood plains. It must be recognized that flooding is a part of the natural process, and that flood problems exist only when this flooding affects man's activities. Structural measures are no panacea for providing flood protection, since structures can be overtopped by flows larger than design flows or they can fail completely. In other cases, there might not exist an available site for protective structures, or funds may be available. Nonstructural methods of control, such as flood plain zoning, tend to balance the benefits obtained against the costs that flooding would impose on the community and the costs incurred by developers prohibited from utilizing land according to their wishes. Nonstructural measures for flood control have been enacted at all levels of government. Some measures are controversial. For example, flood plain zoning requirements may be challenged in the courts for allegedly imposing undue hardships upon riverine landowners. Courts have generally invalidated restrictions which deny all economic uses for flood prone land although severe restrictions are upheld. (Poertner)
W73-12004

SURVEYS REQUIRED TO DESIGN NONSTRUCTURAL MEASURES,
Georgia Inst. of Tech., Atlanta.
L. D. James.
Preprint No. 1881, American Society of Civil Engineers, National Water Resources Engineering Meeting, Washington, D.C., January 29-February 2, 1973. 25 p. Price: $0.50.

Descriptors: *Flood protection, *Non-structured alternatives, *Attitudes, *Data collections, Social aspects, Pyschological aspects, Decision making, Motivation, Flood damage, Flood plains, Flood plain zoning, Flood control, Project planning.

Nonstructural measures for flood protection require information gathering surveys just as structural designs require surveys to gather information. The problems of nonstructural measures are more complex than the problems of structural measures since they depend on human attitudes and actions which vary from person to person and change in time. For example, while a dam may stand for 100 years or more, attitudes on flood plain zoning regulations may change soon after the last major flood is forgotten. This requires vigilance on the part of responsible officials to keep attitudes in theirproper perspective by means of continual information programs. Among individuals, attitudes toward flooding of their property may range from an intense desire to avoid flood prone areas to almost total unconcern for the problems. Surveys of the attitudes of the public to flooding can be used to form a model of how different groups will react to various alternatives to nonstructural measures of flood control. Some people, for instance, live in flood prone areas because they did not realize the flood hazard. Others felt the flood damage expected was outweighed by the advantages of the homesite. Some could be convinced to move out based on the flood hazard to themselves, while others consider the potential disruption of the area's ecology by their presence as a reason for not occuppying flood prone lands. (Poertner)
W73-12005

BALANCING ENVIRONMENTAL AND DEVELOPMENTAL VALUES,
National Water Commission, Arlington, Va.
G. C. Taylor.
Preprint No. 1910, American Society of Civil Engineers, National Water Resources Engineering Meeting, Washington, D.C., January 29-February 2, 1973. 9 p, 2 ref. Price: $0.50.

Descriptors: *Water allocation (Policy), *Water supply development, *Water resources development, *Water values, Alternate water use, Comprehensive planning, Planning, Natural resources, Competing uses, Non-consumptive use, Aesthetics, Social aspects.

The almost total development of usable water supplies is forcing a change in social and political responses to water management problems. It will be necessary to assign values and prices to water use. Concerns for economic development will need to be balanced against the desire for environmental preservation and control. In most sectors of our economy, the economic value of a commodity has been the governing factor for controlling its use. Such a basis for use of water resources can be inadequate since there are social and environmental factors not reflected in the market value. Water allocations are often made by nonmarket means, and are influenced by power monoplies, lack of knowledge, etc. In some types of water use--such as navigation and recreation--the use of the water is nonconsumptive and the water can be used for other purposes. In other uses, the water is consumed and permanently withdrawn from the water supply under examination. In still other uses the water is returned to the water supply in a polluted form, contaminating a large volume of water than actually used. Each of these types of water use has a different value, although the value may be difficult to assign. Often an overall evaluation of all potential water uses will need to be made to optimize water resource management. (Poertner)

CONSENSUS: THE FIRST STEP,
Northeastern Illinois Planning Commission, Chicago.
M. L. Rockwell.
Water Spectrum, Vol 5, No 1, p 9-16, 1973. 9 photo.

Descriptors: *Flood control, *Coordination, Urbanization, Storm water, Planning, Flood plains, Conferences, Illinois.
Identifiers: *Flood plain management, Chicago, Northeastern Illinois Planning Commission (NIPC), Public involvement.

Flood plain management in heavily urbanized northeastern Illinois where severe flooding has recently occurred is discussed. The Northeastern Illinois Planning Commission has been quite active in advocating flood plain management and carrying out various programs such as flood hazard mapping. However, the results have been limited as urbanization of flood plain areas has proceeded rapidly. With the recent flooding, public concern for flood control and flood plain management has increased considerably and several meetings have been held. The most significant meeting was a Storm Water Conference on March 10, 1973, attended by 550 citizens and elected officials. One result of the Conference was the ranking of various alternative solutions of flood control such as reservoirs, storm sewer systems, land use controls, and channel improvements. The highest ranked alternative was the on-site detention of storm water, particularly in large developments. (Elfers-North Carolina)

The amount of water being used by various sectors of the Soviet economy is increasing each year. Although environmental factors affect virtually all items in the water balance, they tend to be ignored in establishing water-use rates and in estimating water consumption. An analysis is made of the impact of environmental factors on the volume of water used by major consumers, including thermal powerplants, industry, domestic and municipal water users, and agriculture. In most sectors of the economy there is a clearly defined relationship between water consumption and the natural environment. Gross water use in the steppe zone of the USSR is generally 20%-30% higher than in the taiga, with an even greater difference in consumptive use. Environmental conditions in the United States account for use rates in industry and thermal-power generation that are 25%-30% higher than in the Soviet Union, while domestic and municipal water requirements in the United States are 20% higher. The differences in consumptive use are even greater. (Josefson-USGS)

NATURAL FEATURES IN BURLINGTON COUNTY.
Burlington County Planning Board, Mount Holly, N.J.

February, 1973. 50 p, 4 tab, 24 maps, 3 append. HUD N.J. P-132.

Descriptors: *Natural resources, Physiography, Climate, Geology, Groundwater, Soils, Urban land use, Agriculture, Erosion control, Aquifers, *New Jersey.
Identifiers: *Burlington County (New Jersey), Urban development constraints, Land use sutability.

The rich and varied natural setting of Burlington County that provides a setting for scientific study, recreation and everyday living is examined. Limitations on development due to natural factors are discussed. Inventories and descriptions of natural features of the county are divided into physiography and climate, geology and hydrology, soils, and animal and plant life. With regard to water resources, the emphasis is on groundwater aquifers and soil suitability for septic tanks. Maps indicate specific areas of the county that are not suitable for various activities or types of development. These include not only general categories such as residential development but also specific uses such as streets and parking lots, parks and playgrounds, sanitary landfills, small building foundations, and areas suitable for certain crops. Recommendations include encouragement of passing flood control and erosion control ordinances, establishment of more stations to monitor environmental conditions, preservation of open spaces and tree preservation especially in subdivisions, discouraging premature development of farm lands, and acquiring of lineal parks along streams in the townships to attack drainage problems along major streams. DIGITAL TELEMETRY--FUNCTIONAL DESCRIPTION AND SPECIFICATIONS,
Geological Survey, Washington, D.C. Water Resources Div.
G. F. Smoot, and R. H. Billings.
Geological Survey open-file report, 1969. 27 p, 3 fig.

Descriptors: *Telemetry, *Digital computers, *Hydrologic data, *Remote sensing, Methodology, Remote control, Control systems, Data collections, Data transmission, Costs.
Identifiers: *Digital telemetry.

A digital telemetry system designed for transmission of hydrologic data is described. This system provides for data reception in a computer-compatible form. Usually, the main disadvantage of a digital telemetry system is its high initial cost. However, because the U.S. Geological Survey is already recording data at many of its sites in BCD (Binary Coded Decimal) form utilizing an ADR (Analog-to-Digital Recorder), a large part of the cost--that required for analog-to-digital conversion--is eliminated. Furthermore, due to the less stringent transmission facility requirements, operating costs generally are lower than comparable analog systems. (Woodard-USGS)

Identifiers: *ERTS.

Accomplishments of the University of Nevada ERTS program are summarized. A detailed quantification was made of crested wheatgrass seedings within the state of Nevada. Within each county seedings were identified, delineated, and quantified using the MSS seven band from September 13-17, 1972. This band has proven the most useful for identification and quantification of seedings. Large scale photography and reference maps verified many seedings, some of which were difficult to identify positively with ERTS imagery. Identification and quantification of water bodies is being attempted. Using ERTS imagery and the MSS seven band, most water bodies are easily identified. An increase or decrease in water quantity will be reflected in a corresponding increase or decrease of surface area. Fire scars, both recent and old, are being inventoried and monitored. A quantitative estimate of the number of acres burned may be obtained easily. The sequential nature of the ERTS data is particularly well adapted for this type of inventory. Sequential imagery aids in detecting changes in playas. Phreatophytic vegetation was partly quantified along the Truckee River and the Las Vagas Wash, using ERTS imagery. (Knapp-USGS)

Journal of Geophysical Research, Vol 78, No 18, p 3564-3572, June 20, 1973. 3 fig, 1 tab, 12 ref.

Descriptors: *Sea ice, *Microwaves, *Remote sensing, *Ice cover, Instrumentation, Aerial photography, Temperature, Salinity.
Identifiers: Microwave radiometers.

A combination of remote sensing from an aircraft and simultaneous surface measurements confirm the feasibility of identifying old and new sea ice according to its emission of thermal radiation at wavelengths between 0.3 and 3 cm. Emissivity of first-year thick ice with a surface temperature of about 260K is 0.95 or greater for wavelengths between 0.81 and 11 cm; the emissivity of multiyear ice is 0.8 at 0.81 cm and 0.95 at 11 cm, increasing monotonically in this wavelength interval. The ease with which multiyear ice can be distinguished from first-year ice using a passive microwave radiometer was demonstrated by comparing mosaics prepared both from photographs and images of 1.55-cm radiation. Available from NTIS, Springfield, Va 22151 as AD-754 579 Price $3.00 printed copy; $1.45 microfiche. Special Report SR 183, December 1972. 16 p, 9 fig, 2 tab, 3 ref, append.

Descriptors: *Remote sensing, *Satellites (Artificial), *Dams, *Reservoirs, Surveys, Aerial photography, Photogrammetry, Drainage patterns (Geologic), Lakes.
Identifiers: *ERTS imagery.

ERTS-1 imagery can be useful in locating water bodies over 152 m in diameter. Dams on streams can be identified by an abrupt change in stream width. A linear termination on a water body is a reliable indication of a dam, particularly when it is inconsistent with the normal drainage pattern. Care must be exercised to avoid confusing cloud shadows with water bodies. However, the association of a cloud with its shadow usually can be accomplished since the sun angle is noted in the data given on each ERTS image. The location of water bodies, the size and shape of water bodies, identification of dam sites on major rivers, the direction of stream flow of major hydrologic networks, relative water depths, and gross sedimentation patterns may be determined from ERTS imagery. ERTS-1 imagery, in general, does not supply information suitable for determining dam height, type of dam construction, depth of water bodies, or location of water bodies less than 6 acres. Descriptors: *Pipe flow, *Closed conduit flow, *Hydraulic systems, *Head loss, Mathematical models, Equations, Fluid mechanics, Computer programs.
Identifiers: Hydraulic networks, Linear analysis.

A method of analyzing flow distribution in hydraulic networks is presented. Basically, this method uses a linearized head loss term which allows a network of n pipes to be described by a set of n linear equations which can be solved simultaneously for the flow distribution. Because of the linear approximations used, several trials will be required to get an accurate solution. This method of analyzing hydraulic networks is characterized by an assured convergence which is very rapid when compared to other available methods. One reason for this is that it is possible to compute a fairly accurate initial flow distribution and no initial estimates are required. In addition, the method applies directly to both closed loop systems and open-closed loop systems. The method is also easy to program for solution on a digital computer. (Woodard-USGS)

EVALUATION OF SEASONAL TIME-SERIES MODELS: APPLICATIONS TO MID-WEST RIVER FLOW DATA,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
A. I. McKerchar, and J. W. Delleur.
In: Proceedings (Vol I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 31-47, (1972) 4 fig, 2 tab, 13 ref.

Descriptors: *River flow, *Forecasting, *Stochastic processes, *Seasonal, *Ohio River, *Evaluation, *Hydrologic data, Time series analysis, Mathematical models, Monthly, Tributaries, Water resources development, Optimum development plans, Equations, Systems analysis.
Identifiers: Mid-west, Daily flows, Synthetic data.

Stochastic models are well fitted to hydrologic data: They enable forecasts of the data one and more time periods ahead, and they enable the generation of sequences of synthetic data. These techniques are of considerable importance to the design and operation of water resource systems. Short sequences of data lead to uncertainties in the estimation of model parameters and to doubts about the appropriateness of particular time series models; a premium is placed on models that are economical in terms of the number of parameters required. Two models that take account of seasonal and persistence effects in runoff data are described and fit 16 series of monthly flows for rivers that are tributaries to the lower Ohio River. These models are: (A) an autoregressive model, a conventional Thomas-Fiering type model, in which individual monthly means and standard deviations are explicitly accounted for; and (B) a multiplicative ARIMA (autoregression-integrated-moving-average) model of the type described by Box and Jenkins. Consideration of the forecasts shows that both models represent the seasonal variations in monthly means. However, model B does not account for the seasonal variability in monthly standard deviations; for this reason its utility is restricted. (See also W73-12269) (Bell-Cornell)

D. P. Gaver.
In: Proceedings (Vol. *), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 64-90, (1972). 18 tab, 8 ref.

Descriptors: *Simulation analysis, *Stochastic processes, *Monte Carlo method, *Estimating, *Variability, Computers, Equations, Distribution, Operation research, Mathematical models, Hydrology.
Identifiers: *'Jackknife' method, Antithetic variates technique.

The problem of assessing and comparing the variability of complex functions of random variable realizations is important in many applied areas, including hydrology. Difficulties stem from nonrobustness: For example, the usual (normal distribution based) confidence limits for variances based on the chi-squared statistic often turn out to be narrow (non-conservative) and thus to falsely overstate confidence when data is non-normal. Promising results are described of some exploratory simulations to evaluate the small-sample characteristics of new variance (and also mean) estimates. Investigated is the performance of one useful method, the 'jackknife' of Quenouille and Tukey, for setting confidence limits on the variance or standard deviation of an unknown distribution. By using empirical sampling employing a computer, it is shown that the jackknife method seems to be an improvement upon normal-theory methods. Finally, the performance of the jackknife method for anlyzing a stochastic simulation experiment is discussed. The simulation makes use of the Monte Carlo technique known as antithetic

variates; this technique is introduced in order to improve simulation efficiency. (See also W73-12269) (Bell-Cornell)

In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 105-114, (1972). 3 fig, 8 ref.

Descriptors: Floods, *Flood data, *Evaluation, *Stochastic processes, *Monte Carlo method, *Climatic zones, Design, Flood peak, Probability, Distribution, Mathematical models, Systems analysis, Meteorological data, River flow.
Identifiers: *Data generation, *Wye River (Wales), British Isles, Value data, Autoregressive models, Pearson-type distributions, Seasonal, Historical data.

Stochastic analysis of floods is a field of research which has been comparatively untouched. The fitting of theoretical distribution functions to series of extreme value data has serious limitations. Inherent uncertainties and misconceptions mar the probable maximum precipitation method used in the design of major spillways. Data generation is a fruitful field of research. Monte Carlo or data generation methods offer a wide array of stochastic process for the investigation of extreme events. In this study, data is generated on the basis of an autoregressive model which seems appropriate when the climatological zone of the British Isles is considered. The fourth order autoregressive model is fitted to a five-day riverflow series from a Welsh catchment. The Pearsonian family of distribution functions is closely examined; appropriate Pearson-type distributions are fitted seasonally using an exact and rapid transformation procedure. The generated pentad data is segmented to form daily flows. Results from the application to a 35 year record of the river Wye at Rhyader in mid-Wales are compared with Poisson and physical techniques. (See also W73-12269) (Bell-Cornell)

BIAS, ILLUSION, AND DENIAL AS DATA UNCERTAINTIES,
Geological Survey, Washington, D.C.
J. R. Slack.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 122-132, (1972). 15 ref.

Descriptors: *Synthetic hydrology, *Streamflow, *Stochastic processes, *Water resources, Planning, Constraints, Estimation, Model studies, Systems analysis, *Risks.

The application of mathematical models to the generation of synthetic flows can lead to a number of problems concerning the adequacy of synthetic flow traces in water resources planning. A stochastic model is usually selected for its theoretical ability to preserve certain statistics and its apparent analogy with the real-world process. The successful application of the model requires that the questions of bias, illusion, and denial be resolved. Bias inherent in the generating process must be discovered and overcome; while a given model will in theoretical expectation for infinite samples preserve a given statistic, the model may produce finite samples having on the average statistics different from the 'expected' statistics. The modeler must understand that every historic record is no more than an illusion of the real world; a single finite realization (historic record) of a random process rarely has sample estimates equal to the population parameters. The possibility that a model may deny itself must be explored. Many stochastic models are quite capable of producing finite samples having statistics which are outside the domain of driving parameters acceptable to the model. Each of these uncertainties is due to the unsteady nature of finite realization of a random process. Each is an artifact of the assumed model. (See also W73-12269) (Bell-Cornell)

GREAT LAKES WATER LEVELS, 1970, DAILY AND MONTHLY AVERAGE WATER SURFACE ELEVATIONS.
National Ocean Survey, Detroit, Mich. Lake Survey Center.

Available from NTIS, Springfield, Va. 22151 as COM-73 10271 Price $3.00 printed copy; $1.45 microfiche. National Ocean Survey Report, August 1972. 108 p.

Descriptors: *Water level fluctuations, *Great Lakes, *Basic data collections, Gaging stations, Networks, Elevation, Surface waters, Water level recorders, Lakes, Sites, Rivers, Tributaries, Inflow.

Lake Survey Center Great Lakes and tributary water level gage records are presented for daily and monthly average levels for each of the 60 sites in the network during the 1970 calendar year. In a separate table the highest and lowest daily average are shown for the month. In addition a frequency distribution table of daily average levels shows the number of times each month the recorded levels were above a specified elevation. The gages record water levels in either an analog or a digital form a strip charts which are retained for a period of ten years. Recorded hourly values were used to compute the daily averages, and the monthly values were compiled from the daily averages. (Woodard-USGS)

MECHANISMS OF ENERGY ABSORPTION IN SPEICAL DEVISES FOR USE IN EARTHQUAKE RESISTANT STRUCTURES,
California Univ., Berkeley.
J. M. Kelly, R. I. Skinner, and A. J. Heine.
Bull N Z Soc Earthquake Eng, Vol 5, No 3, p 63-88, Sept 1972. 20 fig, 2 tab, 14 ref.

Descriptors: *Energy absorption, *Seismic design, Structural design, Steel structures, Reinforced concrete, Plastic deformation, Laboratory tests, Fatigue (Materials), Flexibility, Ductility, Dynamic loads, Fatigue (Materials), Torsion bridge piers.

A structure designed to resist earthquake attack must have the capacity to dissipate kinetic energy. Recent research has shown that beam-to-column connections in steel and reinforced concrete frames are not reliable when subjected to cyclic loading. Throughout the world, efforts are directed toward increasing the reliability and energy absorption capacity of structural connections. An alternative is to separate the load-carrying function of the structure from the energy-absorbing function and to determine whether special devices could be incorporated into the structure with the sole purpose of absorbing the kinetic energy. The 3 energy-absorbing devices tested included the rolling of strips, torsion of square and rectangular bars, and the flexure of short, thick beams. Characteristics of primary importance were: (1) load displacement relations, (2) energy absorption capacity, and (3) fatigue resistance. Tests show that the plastic torsion of mild steel is very efficient for energy absorption. The other 2 mechanisms studied were both less efficient and less reliable than torsion, but are adaptable to more compact devices and are readily accessible for replacement after use. (USBR)

Descriptors: *Tunnel construction, Tunneling, Tunnel lining, Tunnels, Tunneling machines, Tunnel design, Load distribution, Construction methods, Stress analysis.
Identifiers: *Tunnel supports, *Liner plates, Boring machines, Shields, Vertical loads, Axial loads, Construction methods, Foreign construction, Buckling, Stress analysis.

Use of the shield tunneling method with steel liner plates in Germany is described. This method has proved highly successful for driving small diameter tunnels in soft ground, where excessive ground water was encountered, and when tunneling under compressed air conditions was advantageous. The new technique was found to be competitive in cost and is better suited to soft ground tunneling. A general description of the liner plates and strength analysis of the flexible liner plates to earth pressure are presented. Determination of the load-carrying capacity of liner plates using a Terzaghi method and comprehensive tests by the Illinois Institute of Technology, Chicago, are discussed. From these test, diagrams were made for each plate thickness showing the load under which different diameter liner plates collapse by buckling. Details of a shield tunneling machine are illustrated; 3 tunneling projects using this method are described. (USBR)

THE HENDRIK VERWOERD DAM OF THE ORANGE RIVER PROJECT, SOUTH AFRICA.
South African Embassy, London (England).

Water Eng, Vol 76, No 919, September 1972. 7 p, 1 map, 8 photo.

Descriptors: *Tunnels, *Radial gates, Water resources development, Sedimentation, Sediment control, Hydraulic structures, Hydroelectric power, Multiple purpose projects, Hydraulic turbines, Recreation, Flood control, Dam construction, Design, Dam design, Foreign projects, Concrete dams.
Identifiers: *Double-curvature arch dams, *Intake towers, Construction methods, South Africa, *Hendrik Verwoerd Dam (South Africa), *Orange River Dev Proj (South Africa), Orange River (South Africa).

Features of the Hendrik Verwoerd Dam, the principal component of the Orange River Development Project, are described. This dam impounds the largest man-made lake in South Africa behind a double-curvature main arch and 2 concrete gravity flank walls forming artificial gravity abutments. Approved in 1962, the project is scheduled for completion about 1990. Water from the project will be used for irrigation, urban and industrial purposes, hydroelectric power, and recreation. Design features of the dam and the intake for the Orange-Fish Tunnel are given. The Orange-Fish Tunnel, the second-longest (51.4 mi) water conduit in the world, will divert water from the Orange River Basin to the Eastern Cape Province for irrigation and industrial use. Because of the heavy silt load carried by the river, special considerations were given to sediment storage. A program to educate farmers in modern soil conservation methods and improved farming techniques has been instituted as an effective method of combating siltation by preventing soil erosion. Ultimately the installed capacity will be 320 mw. (USBR)
W73-11740

AN UNDERGROUND STORAGE RESERVOIR AS AN ARTIFICIAL STRUCTURE,
Energoprojekt, Belgrade (Yugoslavia).
J. Bozidar.
Water Power, Vol 24, No 10, p 375-381, Oct 1972. 7 fig.

Descriptors: Tunnels, Underground storage, Underground structures, Reservoirs, Hydroelectric powerplants, Hydraulic structures, *Power system operation, Fluid flow, Hydraulics, Unsteady flow, Turbines, Generators, Foreign projects, Water resources development, Reservoir operation, Surge tanks.
Identifiers: Yugoslavia, *Underground water storage, *Transient flow.

Lack of suitable damsite for the Vrla 3 hydroelectric powerplant in Yugoslavia led to the construction of a network of interconnecting tunnels for operation as an underground storage reservoir. Located at the beginning of the Vrla 3 supply tunnel, the underground storage tunnel has a total length of 2,000 m and a capacity of 30,000 cu m. The 2.75-m-dia supply tunnel is 7,333 m long and is also used partly as a storage reservoir. Design discharge is 16 cu m per sec for 2 generating units. Using half the design discharge, 1 unit has been running since 1957; operation of the reservoir has been satisfactory. The supply tunnel is designed to function normally under pressure during power generation, and as a free surface channel when the reservoir is empty. To permit tunnel operation in 2 different regimes. 2 basic problems to be solved were: (1) to protect the penstock against the entrainment of air from the surge tank and the supply tunnel during operation, and (2) to assure rapid and efficient discharge of air from the tunnel during filling. Analyses of model investigations of the transient flow occurring during the emptying and filling of the tunnel are presented. Possible operating difficulties with the system when the second unit is placed in service in 1973-75 are discussed. (USBR)
W73-11741

AN APPROACH TO UNDERGROUND CONSTRUCTION,
D'Appolonia (E.) Consulting Engineers, Inc., Pittsburgh, Pa.
T. L. Neff.
Paper, 15th Annu Meeting Assoc Eng Geol, Kansas City, Mo, Oct 1972. 24 p, 3 fig, 9 ref.

Descriptors: *Costs, *Contract administration, Construction, *Tunnel construction, Competitive prices, Scheduling, Design, Contracts, Construction costs, Management, Environmental engineering, Research and development, Specifications, Tunneling, Tunnels.
Identifiers: *Cost savings, Underground openings.

Underground construction has greatly increased because of environmental advantages, especially in and near metropolitan centers. However, the underground industry is plagued by inefficiency and lack of flexibility, resulting in cost and time overruns. One of the inherent problems is having to deal with subsurface conditions that cannot be completely known prior to construction. The projected dollar volume of underground construction in the next decade makes seeking immediate ways to lower the cost of such construction imperative. Improvements must be achieved both in development of new and better technology, especially in the application of technology to construction projects. Clearly a breakthrough is needed. One possibility for lowering underground construction costs is a contract that permits engineered construction. A negotiated incentive contract that rewards innovation and efficiency has been proposed. To enable the suggested approach to succeed, strict controls on contingencies, costs, and schedules are necessary. The integrated civil engineering project and the observational approach could provide a sound basis for achieving required controls. (USBR)

THREE-DIMENSIONAL BEHAVIOR OF A CENTRAL CORE DAM,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. B. Palmerton, and G. Lefebvre.
Available from the National Technical Information Service as AD-756 443, $3.00 in paper copy, $1.45 in microfiche. Research Report S-72-1, December 1972. 62 p, 34 fig, 14 ref.

Descriptors: *Dam design, *Design criteria, *Engineering structures, *Stress analysis, Strain, Computer models, Computer programs, Structural analysis, Structural behavior, Valleys.

A three-dimensional finite element computer program is used to investigate the stress and displacement conditions of a dam situated in a narrow steep-walled valley. Nonlinear stress-strain behavior and incremental construction of the dam are included in the analyses. The three-dimensional analyses are compared to the plane strain behavior of a transverse section of the dam and indicate significant differences in the stress behavior. The differences are primarily due to the effect of arching caused by the valley walls. A Stress conditions leading to conditions favorable to horizontal hydraulic fracturing are discussed. BOWIE DAM AND LAKE PASCAGOULA RIVER BASIN, MISSISSIPPI AND ALABAMA (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Mobile, Ala.

August 1972. 69 p, 1 map, 1 append.

Descriptors: *Multiple-purpose reservoirs, *Mississippi, *Environmental effects, *Flood control, Reservoirs, Recreation, Flood protection, Multipurpose projects, Water quality control, Agriculture, Land use, Water supply, Wildlife habitats, Dam construction, Earth dams, Water supply development, Reservoir construction, River basin development, Alabama.
Identifiers: *Environmental Impact Statements, *Pascagoula River basin (Mississippi-Alabama).

This multipurpose reservoir project on Bowie Creek in Mississippi is designed for flood control, water supply development, general recreation, and fish and wildlife enhancement. Adverse environmental effects include loss of 5,500 acres of agricultural and forest lands and its associated wildlife habitat, as well as loss of free-flowing stream fisheries and the disruption of inhabitants. Alternative sites and no-development were considered; however, the single purpose projects proved to be less efficacious or economically infeasible. The project would provide extensive flood protection, a dependable water supply, and high quality recreation areas. Additional conversion of woodland to agricultural land may be induced by project implementation. Overall, the basic objective of the program is to plan for the best use, or combination of uses, of water and related land resources to meet all foreseeable short and long-term needs. BREVARD COUNTY BEACH EROSION CONTROL PROJECT (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Jacksonville, Fla.

Available from National Technical Information Service, U.S. Dept of Commerce as EIS-FL-72-5590-F, $3.75 in paper copy, $1.45 in microfiche. May 1972. 29 p, 1 plate.

Descriptors: *Erosion control, *Environmental effects, *Florida, *Beach erosion, Dredging, Water quality, Recreation, Aquatic animals, Coastal engineering, Shore protection, Sands, Shores, Tidal effects, Benthic fauna, Waves (Water), Littoral drift, Jetties, Turbidity, Beaches.
Identifiers: *Environmental Impact Statements, *Brevard County (Fla).

This project consists of partial restoration of 2.8 miles of Atlantic Ocean shoreline at the city of Cape Canaveral and partial restoration and periodic nourishment of 2 miles of shore at the cities of Indialantic and Melbourne Beach in Brevard County, Florida. Future nourishment of the Cape Canaveral reach would be accomplished by the authorized sand-transfer plant for Canaveral Harbor. About 988,000 cubic yards of material will be initially dredged from offshore and placed on the beach at Cape Canaveral and approximately 603,000 cubic yards of initial fill will be placed on the beach at Indialantic and Melbourne. Dredging will temporarily degrade water quality, cause the beach to be temporarily closed for public use, and will destroy most benthic animals in bottom sediments and cover those in the beach nourishment area. Consideration was given to several alternative plans but it was finally determined the proposed project was the only one which was economically feasible and capable of accomplishing the ultimate objectives. ENGINEERING REPORT ON MASON STREET AND MILBANK AVENUE DRAINAGE AND DRAINAGE SYSTEMS, GREENWICH, CONNECTICUT.
Gannett Fleming Corddry and Carpenter, Inc., Harrisburg, Pa.

Greenwich Department of Public Works, Greenwich, Connecticut, March 1, 1972. 37 p, 6 fig, 2 append.

Descriptors: *Storm drains, *Drainage systems, *Evaluation, *Urban drainage, *Flood control, *Sewerage, Storm runoff, Urbanizations, Connecticut, Pipes, Outlets, Tides.
Identifiers: *Greenwich (Conn).

The Town of Greenwich, Connecticut has experienced stormwater flooding in the Mason Street and Milbank Avenue area. This has resulted from increased urbanization and the inability of existing drainage facilities to accept and convey the increased amounts of stormwater runoff. The capacity of existing storm drainage systems in the area was investigated and a preliminary design of a storm drainage system was prepared. The area contains 165 acres, all urbanized. Two separate storm drainage systems exist--along Mason Street where the area is primarily commercial, and along Milbank Avenue where it is predominately a residential area. The terrain is rolling, sloping from the north down to sea level at Long Island Sound. Preliminary designs and cost estimates were made of alternate drainage systems to adequately handle stormwater runoff from the 10, 25, and 50-year storms. Cost vs. storm frequency relationships were analyzed and a system was recommended to handle the runoff from a 10-year storm in the northern and eastern half of the study area. A 25-year design storm event was selected for the southern and western half of the area. As part of the design considerations, tide levels had to be known, since high tides at the sewer outlets reduce the discharge capacity of the drainage system. Total system cost was estimated at $3.4 million with construction extending over a seven-year period. Practically all existing storm drains are recommended for replacement. (Poertner)

8B. Hydraulics

CRITERIA FOR STABLE EARTH CHANNEL DESIGN,
Soil Conservation Service, Upper Darby, Pa.
G. E. Oman.
Paper 72-763, 1972 Winter Meeting American Society of Agricultural Engineers, Chicago, Illinois, December 1972. 15 p, 12 fig, 5 ref.

Descriptors: *Channel erosion, *Bank erosion, *Tractive forces, Canal design, Irrigation canals, Channel flow, Design flow, Bank stability, Design criteria, Hydraulic design, Soil erosion, Floodways, Surface drainage, Channels, Canals, Erosion.
Identifiers: Erosion strength, Channel design, Stable channels, Unlined channels, Sediment concentration.

In determining stability of an earth channel against erosion, the Soil Conservation Service uses either the allowable velocity or the allowable tractive stress methods. Both are based on the principle of the threshold of particle movement. The allowable velocity method considers: suspended load in the water, earch material of the channel, depth of the flow, slope of the channel bank, curvature of the channel, and frequency of the design flow. Equations and curves for computing channel stability by the tractive stress method are presented. Problems encountered in using the 2 methods include: (1) criteria are not always explicit; (2) sediment load quantity and effects must be estimated; (3) earth material varies along the channel; (4) consideration must be given for vegetation growing along the channel; (5) methods do not apply to non-cohesive fine-grained materials and dispersable cohesive soils; and (6) corrections based on the roll down effect of the particles are based on limited data. Further evaluation of the performance of existing channels is encouraged. (USBR)
W73-11746

CHANNEL CONDITIONS, DEVIL'S ISLAND REACH, MISSISSIPPI RIVER, MISSOURI AND ILLINOIS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. J. Franco, and C. D. McKellar, Jr.
Available from NTIS, Springfield, Va. 22151 as AD-756 442, Price $3.00 printed copy; $1.45 microfiche. Technical Report H-73-1, February 1973. 29 p, 1 fig, 13 plate.

Descriptors: *Engineering structures, *Canal construction, *Mississippi, *Channels, Bypasses, Hydraulic models, Navigation, Model studies, Channel morphology, Depth, Width, Dikes, Evaluation, Ecology, Environmental effects, Fish, Missouri.
Identifiers: *Devil's Island Reach (Mississippi River).

The Devil's Island Reach of the Mississippi River is located about 5 miles upstream of Cape Girardeau, Missouri, between miles 55.0 and 68.0. A movable-bed model with scale ratios of 1:400 horizontal and 1:100 vertical, reproducing approximately 13.0 miles of the Mississippi River, was used to develop a channel of project dimensions through the reach. Results of the investigation indicated that: contracting the channel in this reach to a control width of 1500 ft should generally provide adequate channel depths and alignment; the control width can be reduced to less than 1500 ft to improve the depth and alignment of the channel over crossings with dikes of lower elevation than those used for the 1500-ft contraction; the cost of dike construction can be reduced by use of the stepped-down principle in the design of dike systems; the plan developed during this study produced the best overall results insofar as navigation is concerned; and the habitat of fish and wildlife can be enhanced by the use of properly designed longitudinal sections on some of the spur dikes. (Woodard-USGS)

A FIELD INVESTIGATION OF ROLLOVER FISH PASS, BOLIVAR PENNINSULA, TEXAS,
Texas A and M Univ., College Station. Coastal and Ocean Engineering Div.
S. H. Prather, and R. M. Sorensen.
Available from NTIS, Springfield, Va 22151 as COM-73-10157, Price $3.00 printed copy, $1.45 microfiche. Report No 155 (Sea Grant Publication), 1972. 116 p, 45 fig, 3 tab, 39 ref, 2 append. NOAA TAMU-SG-72-202.

Descriptors: *Hydraulics, *Inlets (Waterways), *Bays, *Gulf of Mexico, *Texas, Fish passages, Tidal effects, Sediment transport, Water circulation, Hydrologic data, Hydraulic properties, Discharge (Water), Flow rates, Sediments, Particle size, Canals, Engineering structures, Evaluation.
Identifiers: *Rollover Fish Pass (Tex), Bolivar Peninsula (Tex).

A field study of Rollover Fish Pass, an artificial tidal inlet connecting Galveston East Bay, Texas, with the Gulf of Mexico, was conducted. The objectives were (1) to evaluate the flow and stability characteristics of the inlet, (2) to investigate the propagation of the tidal wave through the connected bay system, and (3) to evaluate the effect of the inlet on tidal fluctuations and flushing of East Bay. Field work included hydrographic surveys of the inlet and adjacent Gulf beaches, collection and analysis of sediment samples from the inlet and beaches, measurement of tidal fluctuations at selected locations in East Bay, and current measurements in the inlet. Tidal data from the Gulf, provided by the Galveston District, Corps of Engineers, were analyzed along with the field data. The water exchange through the pass is of sufficient magnitude to flush or circulate the waters in the upper end of East Bay, when considered over a long time period. This exchange is probably the greatest contribution the pass makes to the bay system and, by itself, makes the inlet valuable to the area concerned. (Woodard-USGS)
W73-11854

SHOALING CONDITIONS, ST. LOUIS HARBOR, MISSISSIPPI RIVER,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. J. Franco.
Available from NTIS, Springfield, Va 22151 as AD-752 421, Price $3.00 printed copy, $1.45 microfiche. Technical Report H-72-7, November 1972. 56 p, 1 fig, 34 plate.

Descriptors: *Harbors, *Navigation, *Channel improvement, *Mississippi River, *Missouri, Model studies, Shoals, Engineering structures, Design criteria, Channel morphology, Water control, Depth, Locks, Dams.
Identifiers: *St. Louis (Mo), Shoaling, Harbor improvement.

Difficulties encountered during low-flow periods of the Mississippi River in the vicinity of St. Louis, Mo., led to the authorization of studies to determine the advisability of providing improved, commercial harbor facilities. The purposes of the model study were to determine the causes of the shoaling in the harbor and docking areas and to develop plans that could be used to eliminate or reduce shoaling in these areas and in the lower entrance to the Chain of Rocks Canal. The model used was of the movable-bed type, constructed to scales of 1:250 horizontal and 1:100 vertical and reproducing the reach of the Mississippi River and adjacent overbank areas between miles 191.0 and 169.9. Improvement in the conditions along the city front can be obtained by closing the channel along the left side of Mosenthien Island, by extending training structures into the channel on the right side of Mosenthien Island and the channel along the city front, and by constructing a lock and dam structure downstream of the harbor area. (Woodard-USGS)

A MODEL OF SEASONAL CHANGES IN TOTAL NITROGEN CONCENTRATION IN THE LAKE WINGRA WATER COLUMN,
Wisconsin Univ., Madison. Inst. for Environmental Studies.
E. H. Dettmann.
Available from NTIS, Springfield, Va., as EDFB-IBP-72-12; $4.00 in paper copy, $1.45 microfiche. Report EDFB-IBP-72-12, May 1973. 32 p, 12 fig, 17 ref.

Descriptors: *Nitrogen cycle, *Nitrogen fixation, *Aquatic environment, *Lakes, Mathematical models, Forecasting, Seasonal, Sedimentation, Aquatic bacteria, Nitrogen fixing bacteria, Algae, Balance of nature, Limiting factors, Cycling nutrients.
Identifiers: Lake Wingra (Wis).

The seasonal variation in the N content of lake water was modelled. The feedback loop structure determines the time of two maxima predicted by the model. Feedback control on hydrologic N export limits the maximum occurring in late winter. The time of the summer maximum is predicted too early, possibly because of an inaccurate determination of the N sedimentation rate, neglect of the effect of macrophytes, or denitrification processes in the water. The importance of remineralization at sediment surfaces suggests further study of aquatic microbial remineralization. Further extensions of the model will permit coupling with modelling of the biomass and of P. (Bopp-ORNL)
W73-11911

RESISTANCE LOSSES IN NONCIRCULAR FLOOD CONTROL CONDUITS AND SLUICES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
R. G. Cox.
Available from NTIS, Springfield, Va 22151 AD-755-821 Price $3.00 printed copy; $1.45 microfiche. Miscellaneous Paper H-73-1, January 1973. 18 p, 6 fig, 2 tab, 11 ref.

Descriptors: *Pipe flow, *Closed conduit flow, *Roughness (Hydraulic), *Head loss, *Energy dissipation, Hydraulics, Hydraulic design, Hydrodynamics.

In very smooth and in very rough noncircular conduits, conduit cross-section shape has a large effect on fluid flow resistance losses. The conduit shapes normally encountered in Corps of Engineers design of flood control projects were tested. The shape effect in these conduits can be neglected for all practical purposes. Also the concept of equivalent hydraulic diameter can be used with confidence for rectangular conduits having aspect ratios (height to width) between 0.5 and 2. (Knapp-USGS)

POTENTIAL RESERVOIR SITES FOR WATER SUPPLY IN ALABAMA, A PROGRESS REPORT,
Geological Survey of Alabama, University.
L. B. Peirce, and W. E. Smith.
Available from NTIS, Springfield Va. 22151 as PB-213 869 Price $3.00 printed copy; $1.45 microfiche. Preliminary Report, April 1972. 28 p, 2 fig, 1 tab, 5 ref. ADO WRP-71-3.

Descriptors: *Reservoir sites, *Pre-impoundment, *Alabama, *Water supply, Investigations, Projections, Evaluation, Topography, Geology, Hydrology, Drainage area, Streamflow, Water yield, Dams, Design criteria, Water storage, Groundwater resources, Economics, Surface waters.
Identifiers: *Potential reservoir sites (Alabama).

Projections of water requirements in Alabama to the year 2020 indicate that the total commitment for water supply will be approximately 7 bgd greater than in 1970. An increase of this magnitude in the dependable water supply will necessitate a substantial further development of the State's water resources. An awareness of the locations and general characteristics of sites for water-supply reservoirs is a prerequisite in the formulation of any long-range plan for the integrated development of Alabama's land and water resources. Such knowledge is necessary in order that alternative uses of potential reservoir sites, either as land areas or as water areas can be recognized and the relative benefits compared. For example, is a potential reservoir site more beneficially used as a reservoir or as farmland, a wildlife refuge, or an industrial park. Or, if water supply is clearly the need and a potential reservoir site is available, will the reservoir offer advantages over a groundwater supply that might also be available. The inventory of potential reservoir sites was begun in June 1971. (Woodard-USGS)

SONIC CAVITATION STUDIES ON MODEL AND PROTOTYPE WATER TURBINES,
Hydro-Electric Commission, Tasmania.
G. J. Causon.
Inst Eng, Aust, Mech Cham Eng Trans, Vol MC8, No 1, p 24-30, May 1972. 13 fig, 1 tab, 10 ref.

Descriptors: *Cavitation, *Hydraulic turbines, *Francis turbines, *Bubbles, *Collapse, Model studies, Prototype tests, Turbine blades, Turbine runners, Laboratory tests, Frequency, Hydraulic machinery, Sound waves, On-site tests.
Identifiers: *Kaplan turbines, Sonic pickups, Frequency characteristics, Specific speed, Air bubbles, Correlation, Accuracy, Vacuum, Turbine efficiency, Test results.

To assess cavitation, sonic tests on models and prototype of both Francis and Kaplin turbines were performed and compared. Sonic measurements are shown to reflect accurately the onset of cavitation and, therefore, are more useful than conventional measurements of efficiency. The characteristic frequency of cavitation and its changing form with reduced suction conditions are discussed in terms of both model and prototype tests. Good correlation was obtained between model and prototype tests, confirming adequacy of the similarity laws applied. An increase in sound level can accurately fix inception of cavitation in both model and prototype turbines. The tests indicate very small changes in sound level occur between very high cavitation coefficient values and the cavitation coefficient value just before onset of cavitation. (USBR)

THE SPARKING OF LIGHTNING ARRESTERS DUE TO CONDUCTIVE CONTAMINANTS,
Iowa State Univ., Ames.
E. Nasser.
Journal of the Franklin Institute, Vol 294, No 6, p 469-481, Dec 1972. 7 fig, 9 ref.

Descriptors: *Lightning arresters, *Flashover, Laboratory tests, Electrical impedance, Electrical resistance, Electrical equipment, Surges.
Identifiers: *Contaminants, *Valves (Electrical), *Breakdown, *Protection (Electrical), Lightning protection, Lightning surges, Electrical insulation, Sparks, Wet condition, Leakage current, Spark gaps, High voltage, Overvoltage, Transients, Electric discharges, Contamination, Test results.

Overvoltage protection valves and lightning arresters are used in a variety of electrical systems ranging from communication to power, and from sea level to high altitude application. When a transient over-voltage occurs, these devices must conduct the excessive charge to ground, thereby protecting valuable network elements from damage by the transient overvoltage. Flawless operation of these devices is required for reliability of any electrical system. Study of lightning arrester performance under the effects of conductive surface contaminants reveals deterioration of the sparking threshold. Under certain conditions, partial sparking has occurred intermittently but persistently, sometimes causing failure of the arrester because of insulation breakdown. This phenomenon was analyzed using nonlineaar characteristics of different types of gas discharges both within the arrester and the contaminant. The arrester was represented by 4 different models depending on mode of operation. Quantitive data were obtained on the percentage threshold drop of a particular arrester caused by a severe contaminant. Test results are presented. (USBR)

THE EFFECT OF VALVE AREA GAIN ON THE PERFORMANCE OF THE HYDRAULIC SERVOMECHANISM,
Trent Polytechnic, Nottingham (England).
J. Montgomery, and H. R. Martin.
Paper 72-WA/Flcs-7, ASME Winter Annual Meeting, New York, NY, Nov 1972. 6 p, 9 fig, 13 ref.

Descriptors: *Orifices, *Valves, Hydraulic machinery, Control systems, Mechanical engineering, Frequency, Cavitation, Performance, Model studies, Stability, Computer models, Pressure, Viscosity, Friction, Flow control, Automatic control.
Identifiers: *Fluidics, *Servomechanics, *Fluid flow, Amplitude, Peak valves, Damping.

In the theoretical analysis of the hydraulic servomechanism a decision has to be made whether to model rectangular or circular ports in the spool valve. This investigation shows that unless the stability of the system is to be analyzed, modeling circular orifices is a complication that can be avoided because: (1) choice of orifice affects the amplitude response only when the inertia load factor is low and then only at low frequencies; (2) peak pressure is affected only when the inertia load factor is high and then only in the midfrequency range; (3) choice of the orifice does not affect the cavitation performance; (4) a circular orifice provides a more stable system than a rectangular orifice; and (5) a rectangular orifice gives a much better small amplitude response. THE REVIN PUMPED-STORAGE PLANT,
Electricite de France, Paris.
P. R. Gerard.
Water Power, Vol 24, No 11, p 411-418, Nov 1972. 7 fig, 4 photo.

Descriptors: *Pumped storage, *Underground powerplants, *Peak power, Reversible turbines, Pump turbines, Reservoirs, Earth dams, Tunnels, Penstocks, Construction costs, Construction materials, Foreign projects, Tunnel linings, Hydraulic machinery, Geology.
Identifiers: *Hydroelectric powerplants, France, Spherical valves, Electric machinery, Peaking capacities, Intake structures, Foreign construction.

The Revin plant, a 760-mw pumped storage plant being built in the Ardennes in France to furnish 180-km daily peaking power to Paris, is described. This plant, when completed, will be the third largest pumped storage plant in the Belgium-Luxembourg-France area. The project is comprised of a hilltop upper basin having an area of 700,000 sq m; a lower reservoir formed by an earthfill dam across the Faux River; and an underground powerplant, housing four 190-mw, 0.9-pf, single-stage reversible-pump turbine units, each with a spherical valve in its penstock. The units have a vertical shaft arrangement designed to operate over a net head ranging from 212 to 250 m at 300 rpm. The upper reservoir provides storage for 5 hrs of generation at full capacity, and will require 7-1/2 hrs in the pumping mode to refill. To start the units in the pumping mode, a conventional pony motor and compressed air dewatering will be used on 3 units with the fourth unit being started as an asynchronous motor at full voltage. Full-scale construction on the project began in 1970; the firts unit to be in service by the end of 1973, and the remaining 3 by the end of 1974. (USBR)

THE DYNAMICS AND CONTROL OF EULERIAN TURBOMACHINES,
Massachusetts Inst. of Tech., Cambridge.
H. M. Paynter.
Paper 72-Aut-S, Trans Am Soc Mech Eng, Ser G--J Dyn Syst Meas Control, May 1972. 8p, 13 fig, 1 tab, 11 ref.

Descriptors: *Hydraulic machinery, *Hydraulic turbines, *Fluid mechanics, *Control, Pumps, Dynamics, Energy conversion, Pump turbines, Governors, Pulsating flow, Model studies, Reynolds number, Turbine blades, Mechanical control.
Identifiers: *Fluid dynamics, Eulers Equation of Motion, Transients, Wicket gates, Transducers.

An efficient turbomachine (fan, blower, compressor, pump, propeller, or turbine) represents an energy converter or transducer basically gyrational in character. A 2-port gyrator operating in conjunction with a 2-port dissipator can represent the static characteristics of any real machine. This model is further simplified if the machine satisfies Eulerian similitude. If an Eulerian turbomachine is controlled or modulated by movable guidevanes or wicket gates, the necessary fluid-dynamical reaction forces on the gates are constrained by energy couplings directly related to the energy conversion process through the machine. A systematic approach given demonstrates the underlying theory of Eulerian turbomachines and yields rational structured bond graph models useful in dynamics and control studies. These models also provide effective design and operating information for major engineering systems. (USBR)

OPTIMAL GATE CLOSURE SCHEDULE FOR HYDROELECTRIC TURBINE SYSTEM,
Illinois Univ., Urbana.
L. Woziak, and G. H. Fett.
Paper No 72-WA/Fe-23, Trans Am Soc Mech Eng, Ser D--J Basic Eng, Winter Annual Meeting, New York, NY, Nov 1972. 6 p, 5 fig, 16 ref, 2 append.

Descriptors: *Water hammer, Electric power, *Hydraulic turbines, *Governors, *Optimization, Gate control, Penstocks, Computers, Hydraulic machinery, Bibliographies, Hydroelectric powerplants, *Gates, Computer programs, Transient flow.
Identifiers: Overspeed, *Wicket gates, *Closures.

With the National demand for electric energy predicted to double every 10 yrs and with the development of interconnected networks, the requirements in system design for quality of transient behavior have become increasingly more stringent. Advances in computer technology within the last decade have made possible comprehensive simulations on a non-linear basis. A procedure is presented for the generation of an optimal gate closure schedule for the case of full load rejection on an isolated hydroelectric system. Constraints are placed on turbine overspeed and penstock overpressure. The optimization is performed on the basis of minimum integral square of the speed error and implemented digitally by the method of steepset descent. The computation indicates that a substantial performance improvement is achieved with optimal control as opposed to the conventional. The index of performance has a relative value of 1.58 for the optimal strategy. The best solution for the conventional speed governed case was 2.20. (USBR)

8D. Soil Mechanics

BEARING CAPACITY THEORY FROM EXPERIMENTAL RESULTS,
Indian Inst. of Tech., Kharagpur.
A. V. Chummar.
J Soil Mech Found Div, Am Soc Civ Eng, Vol 98, No SM12, p 1311-1324, Dec 1972. 9 fig, 1 tab, 12 ref, 2 append.

Descriptors: *Foundations, Laboratory tests, Cohesionless soils, Soil mechanics, Foundation bearing tests, Structural stability, Foundation failure, Shear strength, Theoretical analysis, Strain, Failure (Mechanics), Model studies.
Identifiers: *Bearing capacity, Continuous footings, Plane strain, Footings, Mathematical analysis, Comparative studies, Bearing values, Failure surfaces.

A theory of bearing capacity of strip footings on cohesionless soils is developed, based on a failure surface deduced from experimentally observed surfaces. Conclusions are: (1) Existing theories on bearing capacity are based on failure surfaces, whose size and shape are different from those observed in experiments. In dense sands the observed surfaces are much smaller than those assumed in theories. (2) For long footings where plane-strain conditions prevail, commonly used theories fail to accurately predict bearing capacity. (3) Bearing capacity equations based on a failure surface deduced from the experimentally observed surfaces predict the bearing capacity of long footings accurately when the plane-strain value of the friction angle is taken as 1.1 times the triaxial test value. (4) The failure surface deduced from experimentally observed surfaces is different from those assumed in existing theories. The deduced surface comprises circular and plane surfaces, the plane surface making an angle close to 45 deg with the horizontal. Equations for calculating bearing capacity are presented. (USBR)

CENTRIFUGE TESTING FOR MODELS OF SOIL STRUCTURES,
Canterbury Univ., Christchurch (New Zealand).
T. A. H. Dodd.
N Z Eng, Vol 27, No 9, p 286-290, Sept 15 1972. 1 fig, 1 photo, 7 ref.

Descriptors: Soil tests, *Centrifugation, Soil mechanics, Laboratory equipment, Earth dams, Pore pressure, Slope stability, Embankments, Consolidation, Tunnels, Model studies.
Identifiers: Japan, Great Britain, Centrifuges, Bearing capacity, *Similitude.

Substantial savings are expected in the cost of designing dams and other earth structures by using centrifuge models rather than conventional laboratory strength and consolidation soil tests. Centrifuge models are based on 2 laws of similarity for soil models: (1) If a gravity-affected soil prototype is modeled in identical soil to a scale of 1/N and this model is subjected to gravitational force of N times that experienced by the prototype, then, provided that the stresses at the boundaries of the model and the prototype are also to scale, the model will behave, to scale, exactly the same as the prototype. (2) Provided the above boundary conditions are satisfied, than any time dependence in the response of the prototype to the applied stress is speeded up in the model by a factor of N squared, provided secondary consolidation can be ignored. Of the centrifuge machines built in Britain and Japan, the largest is capable of accelerating to 200 g; model size range up to 0.6 m high and 1.2 by 2.0 m in plan. Tests performed include: (1) earth dam stability under drawdown, (2) tunnel section deformation, (3) embankment settlement, (4) foundation bearing capacity, and (5) slope stability. (USBR)

8E. Rock Mechanics and Geology

A SURVEY OF LARGE PERMANENT UNDERGROUND OPENINGS IN NORWAY,
Norges Tekniske Hoegskole, Trondheim.
T. L. Brekke.
Paper, Int Symp Large Perm Underground Openings, Oslo, Norway, Sep 1969, p 15-28, 1970. 11 fig, 29 ref.

Descriptors: *Underground powerplants, Geologic investigations, *Underground structures, *Engineering geology, Rock excavation, Rock mechanics, Geology, Rock tests, Education, Rock properties, Expansive clays, Bibliographies, Costs.
Identifiers: *Underground openings, *Tunnel supports, Norway, Hydroelectric powerplants, Unlined tunnels, Foreign construction, Rock pressure.

Construction of underground structures in Norway has been encouraged by favorable natural conditions--generally no more than 5% of a Norwegian underground project is lined or systematically reinforced. The most important underground structures are 110 hydropowerplants. These plants, some with pressure heads of over 1,000 m, provide 75% of the country's electric power. Underground plants were found to be more economical than those in the open, leading to better utilization of available heads, greater flexibility in site choice, shorter pipelines, simplified construction details, year-round construction, and reduced maintenance and repair costs. Low excavation costs, mainly using percussive drilling, greatly influence the economy. Laboratory tests were developed to predict rock indexes for percussive drilling rate, bit wear, and blasting resistance. Important factors causing underground stability problems are: (1) unfavorable directions and combinations of faults, joints, and fissures; (2) rock pressure; and (3) swelling montmorillonite clay. For site investigations, less core drilling is done in Norway than elsewhere. Savings have been realized because the parties involved are willing to reconsider the site, orientation, and design during the construction period. (USBR)

COUPLED STRESS AND FLOW ANALYSIS OF FRACTURED DAM FOUNDATIONS AND ROCK SLOPES,
California Univ., Berkeley.
T. L. Brekke.
Paper, Symp Int Soc Rock Mech: Percolation Through Fissured Rock, Stuttgart, Germany, Sept 1972. 8 p, 12 fig, 3 tab, 11 ref.

Descriptors: *Dam foundations, *Rock foundations, *Seepage, Fractures (Geology), Stress analysis, Finite element method, Joints (Geologic), Uplift pressure, Grouting, Flow nets, Grout curtains, Phreatic lines, Seepage control, Rock mechanics, Water pressure, Fluid flow.
Identifiers: *Rock foundations, Rock slope, Fluid force, Mathematical analysis, Toe drains, Underground openings.

An analytical method is presented that considers the interaction between flow forces, body forces, and boundary loads in fractured rock masses. Although some methods mathematically model a fractured rock mass as a continuum or a rigid discontinuum, the model for this method is a deformable discontinuum whose fractures can change size depending on the stress conditions. In studying the foundation for a gravity dam, 2 finite element techniques and a converging iteration process are used. Steps to be followed are: (1) determine the effect of the structure on the rock mass stress distribution and fracture openings; (2) determine approximate fluid pressures using fracture openings calculated in step (1); (3) determine new fracture openings considering effect of structure and fluid pressures calculated in step (2); (4) recalculate fluid pressure using fracture openings determined in step (3); and (5) iteration of steps (3) and (4) until the changes in fluid pressure are satisfactorily small. Examples using this coupled stress-flow procedure are presented for a gravity dam with 3 different foundation conditions: untreated, grouted, and drained. Results using this method are simetimes considerably different than results using a rigid discontinuum. (USBR)

CONTROL OF CRACKING IN CONCRETE STRUCTURES,
American Concrete Inst., Detroit, Mich. Committee 224.

Journal of the American Concrete Institute, Proceedings, Vol 69, No 12, p 717-753, Dec 1972. 20 fig, 5 tab, 94 ref, append.

Descriptors: *Concretes, *Concrete technology, Concrete construction, Structural design, Concrete structures, Concrete control, Reinforced concrete, Prestressed concrete, Creep, Mass concrete, Strain, Stress, Cracks, Shrinkage, Aggregates, Expansion, Bibliographies, Criteria, Slabs.
Identifiers: *Crack control, *Cracking, Microcracks, Concrete properties, Heat of hydration, Volume change, Criteria.

With the widespread use of high-strength steels and the trend toward ultimate load and limit theory designs, control of cracking in reinforced concrete structures becomes very important. To help engineers exercise better judgment in designing crack-controlled structures, a comprehensive report on the principal causes of cracking and recommended crack control provisions is presented. The basic mechanism of microcracking and fracture mechanics in concrete is explained. Presented are quantitative recommendations for control of cracking due to drying shrinkage, control of flexural cracking, and crack control in prestressed concrete. Effects of long-term loading and exposure are described. Specific recommendations for control of cracks in mass concrete include details of an embedded pipe cooling system. Control of construction practices which cause or facilitate cracking are discussed. (USBR)

DEFLECTIONS OF PRESTRESSED CONCRETE BRIDGES IN JAPAN,
Tokyo Univ. (Japan).
M. Kokubu.
Mag Concr Res, Vol 24, No 80, p 117-126, September 1972. 10 fig, 3 tab, 12 ref.

Descriptors: *Deflection, *Bridge design, Prestressed concrete, Concrete structures, Structural behavior, Cantilevers, Structural analysis, Measurement, Strain, Creep, Shrinkage, Seismic design, Structural design, Earthquake engineering, Concrete mixes.
Identifiers: *Highway bridges, *Railroad bridges, Carlson strain meter, Foreign design practices.

Deflections measured in 5 prestressed concrete bridges in Japan are summarized and discussed. The bridges are long span, hinged at the center, and constructed by the cantilever method. Measured values were compared with values calculated by a simplified deflection formula after the hinges were joined. Despite many factors that could be considered when calculating bridge deflections, fairly good agreement with measured values was obtained by assuming a drying shrinkage strain in concrete of 0.000150 and a creep coefficient of 2.0 over the entire length of the beam. Deflections that may be expected when bridges of the continous type are subjected to seismic forces and designs to cope with these conditions are discussed. To confirm the degree of safety of important bridges, dynamic analyses were made. Natural frequencies determined from vibration tests did not differ greatly from calculated values. A practical method to dampen horizontal seismic forces at each pier using steel dowels is described. (USBR)

CONDITIONS FOR INSTABILITY IN RESTRAINED CONCRETE PANELS EXPOSED TO FIRE,
London Univ. (England).
J. W. Dougill.
Mag Concr Res, Vol 24, No 80, p 139-148, Sept 1972. 1 tab, 11 ref.

Descriptors: *Concrete technology, *Spalling, *Thermal stress, Concretes, Stress, Strain, Heat, Pore pressure, Tensile stress, Numerical analysis, Walls, Computer models, Failure, Concrete structures, Temperature.
Identifiers: *High temperature, *Spalling, *Thermal spalling, Fire safety, Compressive stress, Stress-strain curves, Panels, Cracking, Fires, Calculations.

Instabilities associated with general spalling of plain concrete panels were investigated to obtain a thermal history similar to that obtained in a standard fire test. Results illustrate the effects of flexural restraint and loading of the panels upon the occurrence of general spalling. These effects are important in assessing the performance of structures exposed to fire. Behavior of a heated panel was influenced by the extent of cracking caused by tensile stress, and by the steepness of the descending branch of the stress-strain curve in compression. The first of these effects may have important implications because using large quantities of reinforcing steel in heated panels may transform progressive compression failure, controlled by cracking, to a violent one. The second effect is more difficult to assess, but strain softening may become more serious because of a modest amount of pore pressure in the concrete. Production of steam in the concrete at high temperatures could increase general spalling. (USBR)

METHODS FOR SAMPLING AND DETERMINING SIEVE ANALYSIS OF AGGREGATES LARGER THAN ONE AND ONE-HALF INCH SIEVE,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. L. Curry, R. E. Philleo, and B. Mather.
Available from NTIS, Springfield 22151 as AD-751 104. Price $3.00 printed copy; $1.45 microfiche. Technical Report No 6-543, May 1960. 30 p, 1 fig, 5 tab, 8 ref.

Descriptors: *Sieve analysis, *Aggregates, *Particle size, *Coarse aggregates, Separation techniques, Correlation analysis, Evaluation, Hydraulic structures, Concrete technology, Construction materials, Engineering structures.

Sampling of concrete aggregates larger than the 1-1/2 inch sieve poses special problems due to difficulties encountered in handling and shoveling crushed stone and gravel of large maximum size and the large amount of material required per sample. Methods of sampling tested were grab sampling with a clamshell from the stockpile, trench sampling from trucks loaded with the aggregate, belt sampling while aggregate was being loaded into a storage bin, and grab sampling of materials being discharged from bin storage. Comparative sieve analyses were made of samples of both 1-1/2- to 3- inch and 3- to 6-inch size ranges. The general conclusions were that any of the sampling methods would be satisfactory; that 100-lb samples of 1-1/2 to 2-inch aggregate and 300-lb samples of 3-to 6-inch aggregate would be large enough; that diameter of wire in the 5- and 6-inch sieves should be approximately 0.360 to 0.530 inch, and that hand-sieving of aggregates coarser than the 3-inch sieve may be satisfactorily accomplished. PROCEDURES FOR EVALUATION OF FRACTURE TOUGHNESS OF HEAT-AFFECTED ZONES,
Lafayette Coll., Easton, Pa.
L. J. McGeady.
Weld J, Vol 51, No 12, p 569-s-578-s, Dec 1972. 12 fig, 7 tab, 11 ref.

Descriptors: *Welding, Mechanical engineering, Fabriaction, Failure (Mechanics), Yield strength, Mechanical properties, Strength of materials, Ductility, Steel plates.
Identifiers: *Weldments, *Toughness, *Fractures, *Metal test, Fracture mechanics, Cracking, Critical depth, Tensile properties, Welds, Material test.

A good quality weld requires adequate fracture toughness of base metal, weld metal, and heat-affected zone (HAZ). Inadequate toughness in any area is a threat to structural integrity. Reliable methods of evaluating fracture toughness in the base metal or the weld metal are available, but HAZ toughness evaluation has posed experimental problems and are discussed in this paper. The Drop-Weight (DW) and Dynamic Tear (DT) tests have been widely used to characterize plate and weld metal toughness separately and quantitatively. Data presented demonstrate that these 2 procedures can be applied to HAZ toughness. Results of composite specimen tests and single component tests agree well when applied to several steels. Successful characterization of HAZ toughness using the DW and DT procedures provides quantitative reference data for use in the Fracture Analysis and Ratio Analysis Diagrams. Information from practical test methods is necessary in defining appropriate welding parameters for specific steels. (USBR)

BASIC RELATIONSHIPS AFFECTING THE PLANNING OF SINGLE-PHASE CHEMICAL GROUND STABILIZATION,
G. Greschik.
Symp Prot Underground Build Against Water, Bratislava, Czechoslovakia, p 97-104, Sept 1972. Transl from German, Bur Reclam Transl 884, Dec 1972. 11 p, 7 fig.

Descriptors: *Soil stabilization, Chemical properties, Stabilization, Grouting, Costs, Optimization, Gels, Viscosity, Chemical engineering, Soil mechanics, Chemistry, Strength.
Identifiers: *Chemical grouts, *Sodium silicate, Grout mixes, Chemical compounds, Grouting pressure, Setting (Materials).

Stabilizing ground chemically involves an optimization of both the chemical injection process and the chemical mixture composition. The 2 optimization tasks are linked by the viscosity and setting time of the chemical mixture. The chemical injection process can be solved, after evaluating the ground conditions, with the aid of Maag's or Haefeli's equations, but determining the optimum chemical mixture is usually more difficult. Principal properties of an injection material or gel are the viscosity, setting time, strength, and cost. The chemical components of the injection mixture tested, whose quantity and temperature determine the properties of the mixture, are sodium silicate, a precipitant, and water. Triangular diagrams are presented giving the setting time, initial viscosity, strength, and cost for mixtures with all possible percentages of sodium silicate, precipant, and water. Using the maximum initial viscosity and minimum setting time values calculated for the chemical injection process, the triangular diagrams can be used to determine a chemical mixture with satisfactory strength and economy. Identifiers: *Buried pipes, *Buried structures, Galvanic protection systems, Buried metalwork, Ground currents, Corrosion currents, Electric potential, Galvanic corrosion, Soil resistivity, Underground corrosion, Protection (Electrical).

As the number of underground structures increases, corrosion becomes more as a problem. The rising cost of repairs and replacements for these structures necessitates an increasing demand for corrosion protection methods. Corrosion control practices, such as the application of cathodic protection and protective coatings, and improved metallurgical techniques are becoming more important. The principles involved, the methods used, and design factors for applying cathodic protection are discussed. Cathodic protection consists of making the potential of the soil contacting the buried structure positive so corrosion currents can no longer leave the metal surface. The higher intensity protective currents enter the structure and are drained away by a metallic circuit at a controlled point. If electric currents are kept from leaving the buried structure electrolytically, corrosion is arrested. (USBR)

RESPONSIBLE WELD DESIGN,
Lincoln Electric Co., Inc., Cleveland, Ohio.
O. W. Blodgett.
Weld J, Vol 52, No 1, p 13-21, Jan 1973. 20 fig, 1 tab.

Descriptors: *Welded joints, *Welding, Design, Fabrication, Costs, Stress, Joints (Connections), Steel structures.
Identifiers: *Weldments, Butt welds, *Welds, Butt joints, Fillet welds.

Perhaps in no other field is responsible performance more important to the end product than in weldment design. An expert weldment designer can design welds that will meet all service requirements and yet be lacking in responsible performance because of excessive production costs. A weldment designer is not doing a responsible job unless the design is economical, practicable in production, and workable in service. The experienced, responsible weldment design engineer must know--how welds will be produced, how material will be cut, and how assemblies will be put together. He should have a casual acquaintance with every operation in production. To promote best use of welding the designer minimizes the amount of weld metal to be deposited--thereby proving welding as a method of joining that maintains the full strength of the materials. Twelve shortcomings that produce irresponsible design are discussed. (USBR)

SCALE INHIBITION BY ORGANIC ELECTRODEPOSITION,
Tyco Labs, Inc., Waltham, Mass.
L. Nelsen, and A. H. Taylor.
Available from the National Technical Information Service as PB-218 833, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water, Research and Development Progress Reports No 835, August 1972. 62 p, 11 fig, 12 tab. 14-30-2856.

Descriptors: *Scaling, *Heat exchangers, Inhibition, Evaporators, Crystallization, Calcium sulfate.
Identifiers: Ultra-thin layers, Organic electrodeposition.

A research program to inhibit the formation of calcium sulfate anhydrate scale on heat exchangers of evaporative desalination plants was carried out. In this study ultra-thin layers of organic materials were deposited on heated metallic surfaces by means of controlled electrical potentials. The organics studied included polymers and low molecular weight organic compounds. Both types of coatings resulted in significant reduction in scale. The studies suggest that the deposited layers provided a passivation of the surface preventing scale nucleation. (OSW)

Descriptors: *Canals, *Explosives, *Explosive construction, *Cold weather construction, Frozen soils, Pipes, Plastic pipes, Boreholes, Polyethylene, Foreign construction, Foreign tests.
Identifiers: *Cylindrical charges, *Explosive excavation, *Explosive construction, *Rapid excavation, *Construction methods, Depth of burst, Charges (Explosives), Blasting, Fuses (Explosions), Foreign activities.

Because canal excavation by the conventional explosive method is not uniform, a new method of using a continuous horizontal explosive charge has been developed. In soft soils, 250 to 300 m of flexible polyethylene, high-pressure pipe filled with granular explosive is place automatically at a predetermined depth by a special tractor. Before the explosive is detonated, the buried charge is compacted. A narrow trench, 30 to 40 cm deep, is cut on both sides of the centerline at the design width of the canal. The resulting canal created by a single explosion is fairly uniform. In forzen soil, a narrow trench is excavated and a continuous charge placed simultaneously at the bottom of the trench, enabling the soil to be excavated 10 times faster than by conventional earthmoving machines. Other advantages of this method are: (1) Fewer fuses and detonators are required; (2) only 1/3 the usual amount of explosive charge is required; and (3) earthwork productivity is 400% higher. A curve is included showing the depth and amount of charge required to excavate canals with different cross sections. (USBR)

INTRODUCTION OF KOKANEE SALMON (ONCORHYNCHUSNERKA) INTO LAKE HURON,
Department of Lands and Forests, South Baymouth (Ontario). Research Branch.
J. J. Collins.
J Fish Res Board Can. Vol 28, No 12, p 1857-1871. 1972. Illus.
Identifiers: Alewife, Canada, DDT, Food, Insects, *Kokanee salmon, Lakes, Oncorhynchus-Nerka, Plankton, Salmon, Spawning, *Lake Huron.

An experimental introduction of O. nerka into Lake Huron from egg stocks obtained from British Columbia and several western USA states began in 1964. From 1964-1969, about 5.5 million kokanee (eggs, fry, and fingerlings) were planted. Estimated minimum returns of adults were 9000, 1200, and 4000 in 1967, 1968, and 1969, respectively. Although most of the returns were recorded near planting sites, substantial numbers moved into other areas, in some instances spawning in streams that were not planted. Apparently, most kokanee matured in their third yr of life (2+) and their lengths ranged from 18-49 cm. The incidence of lamprey marks on adults was light (1.6% of 4472 examined) but frequencies of marks tended to increase as fish size increased -- from 0.5% for 28-32 cm fish to 16.7% for fish over 40 cm long. Successful stream spawning in 1967 was indicated by the retrieval of live eggs and alevins from redds and the capture of downstream migrant fry. Shore spawning was verified by retrieval of viable eggs from redds in 1969. The potential egg deposition in the 2 rivers with the largest runs in 1967 was approximately 2.7 million eggs. Fish from British Columbia river-spawning stock spawned both in streams and along shores of South Bay. Since spawning was not restricted to streams, the shore areas of Lake Huron may extend the spawning habitat available to kokanee. Adult kokanee fed mainly on insects and plankton during Aug. and Sept. Aerial forms of insects predominated in South Bay kokanee. Dieldrin and DDT residues were moderate, averaging between 0.012 and 0.046 ppm for dieldrin and 0.226 and 1.242 ppm for DDT in whole tissue samples. Data from South Bay show that the principal species found in association with kokanee were alewife and smelt. The diet

of alewife in Aug. indicated possible competition with kokanee.h-Copyright 1972, Biological Abstracts, Inc.

OBSERVATIONS ON THE MIGRATION OF SOCKEYE SALMON FRY (ONCORHYNCHUS NERKA) IN THE LOWER BABINE RIVER,
California Univ., Berkeley. Dept. of Zoology.
W. C. Clarke, and H. D. Smith.
J Fish Res Board Can. Vol 29, No 2 p 151-159. 1972. Illus.
Identifiers: *Babine River, *Canada, Fry, Fish migration, Oncorhynchus-Nerka, Rivers, Salmon, *Sockeye salmon fry.

No distinct length, weight, or behavioral differences associated with place of capture in the river were observed, indicating that all fry are susceptible to downstream displacement. A minimum of 7.5 million (18%) of the fry produced passed through a counting fence below the spawning grounds. Others reached quiet waters inshore, where they progressively developed behavioral characteristics that enabled them to ascend the river and reach lake nursery areas above. Two million fry ascended an improvised ladder spanning an area of turbulence at the base of the fence. Construction of leads and baffles at stretagic places below the fence could help fry reach shore sooner and increase numbers reaching the lake.--Copyright 1972, Biological Abstracts, Inc.

FERTILIZATION OF PINK SALMON (ONCORHYNCHUS GORBUSCHA) OVA BY SPERMATOZOA FROM GONADOTROPIN- INJECTED JUVENILES,
Fisheries Research Board of Canada, West Vancouver (British Columbia). Vancouver Lab.
E. M. Donaldson, J. D. Funk, F. C. Withler, and R. B. Morley.
J Fish Res Board Can. Vol 29, No 1, p 13-18. 1972. Illus.
Identifiers: Fertilization (Fish), *Gonadotropin spermatozoa, Hormone-Drug, Juveniles, Oncorhynchus-gorbuscha, Oncorhynchus-Tshawytscha, *Pink salmon ova, *Sexual maturation, *Canada (British Columbia).

Sexual maturation in male O. gorbuscha from Jones Creek, a tributary of the Fraser River, British Columbia, was accelerated by intraperitoneal injections of partially purified chinook salmon (O. tshawytscha) gonadotropin. The treated pinks produced milt 1 yr earlier than normal. Milt from these fish was compared with milt from wild lower Babine River pinks with respect to its ability to fertilize the ova of Lower Babine River females. There was no marked differences in proportions of ova fertilized, in survival to hatching, or in numbers of deformed larvae. Densities of sperm in the milt from treated males ranged from 0.15 x 10 to the 9th power to 7.35 x 10 to the 9th power/ml; sperm densities in the milt from wild males ranged from 19.3 x 10 to the 9th power to 38.6 x 10 to the 9th power/ml. Two stages in testicular development were identified among the treated males and found to be directly related to the success of fertilization. The significance of induced early maturation in attempts to establish pink runs in the 'off' year rivers is discussed.--Copyright 1972, Biological Abstracts, Inc.

GROWTH PER MOULT OF TAGGED LOBSTERS (HOMARUS AMERICANUS) IN BONAVISTA BAY, NEWFOUNDLAND,
Fisheries Research Board of Canada, St. John's (Newfoundland). Biological Station.
G. P. Ennis.
J Fish Res Board Can, Vol 29, No 2, p 143-148, 1972, Illus.
Identifiers: Bays, *Bonavista Bay (NF), *Canada (Newfoundland), Growth, Homarus-americanus, *Lobsters, Molt, Tagging.

The suitability of the sphyrion tag for lobster growth studies is demonstrated by comparing growth of ferromagnetic- and sphyrion-tagged lobsters. Carapace length and total weight increments in one molt of 54 males (52-92-mm carapace length) tagged with sphyrion tags averaged 11.4 mm (15.7%) and 185.9 g (60.8%). For 56 females 57-89-mm carapace length they averaged 9.8 mm (13.3%) and 136.3 g (42.5%). Differences in growth per molt between sexes increased with size. For both sexes percent carapace length increment decreased with increase in carapace length but more rapidly for females. Carapace length increment increased with increasing carapace length for males, but for females there was no significant change over the size range considered. Incidence of molting for sphyrion-tagged lobsters was 83.1% and comparable with an observed estimate (82.2%) from field samples obtained shortly after the molting season.--Copyright 1972, Biological Abstracts, Inc.
W73-11914

RECOVERY OF PLANTED BROOK TROUT, SPLAKE, AND RAINBOW TROUT FROM SELECTED ONTARIO LAKES,
Department of Lands and Forests, Maple (Ontario). Research Branch.
J. M. Fraser.
J Fish Res Board Can. Vol 29, No 2, p 129-142. 1972. Illus.
Identifiers: Birds, *Brook trout, Canada (Ontario), Lakes, Predation, *Rainbow trout, Recovery, Salmo-Gairdneri, Salvelinus-Fontinalis, Salvelinus-Namaycush, *Splake, Trout.

Recoveries of hatchery-reared brook trout (Salvelinus fontinalis), splake (Salvelinus namaycush X S. fontinalis), and rainbow trout (Salmo gairdneri), planted in lakes having different resident fishes, were highest (9-30%) in a lake in which minnows and the brook stickleback were the only other fishes. Recoveries, by angling and gillnetting, were considerably lower (2-15%) in 2 lakes containing the white sucker and minnows, and still lower (0.5-5%) in 2 lakes containing spiny-rayed species as well. Recoveries were lowest (<0.5%) in a lake having a complex fish community that included native brook and lake trout. Planted splake and rainbow trout generally yielded higher returns, in weight, than brook trout in comparable situations. The low survival of planted fish was apparently due to the low fertility of the waters and to competition with, or predation by, resident fish species. Predation by fish-eating birds and mammals may also have had an effect. The weight of the catch of salmonids exceeded the weight planted in only 1 lake. Here, the mean yield of planted salmonids was 8.4 kg/ha/hr in comparison with 2.6 to <0.5 kg/ha/yr in the 5 other study lakes.--Copyright 1972, Biological Abstracts, Inc.

HATCHERY REARING OF WALLEYES USING ARTIFICIAL FOOD,
Department of Lands and Forests, Tweed (Ontario).
W. F. Chesire, and K. L. Steele.
Prog Fish-Cult Vol 34, No 2, p 96-99. 1972. Illus.
Identifiers: *Fish diets, Artificial food, Granules, *Hatchery rearing, Trout, *Walleyes.

Walleye were pond reared experimentally at the White Lake Rearing Station in Ontario since 1961. Tests were started in 1965 to determine whether young walleye would feed on an artificial diet, and thus reduce the problem of cannibalism in the ponds. Since 1969, all walleye reared were trained to feed on trout granules. The method consists of first incubating walleye eggs in standard hatchery jars until the fry hatch. The fry are then transferred to fertilized pond where the fish are reared to about 50 mm in length. At this stage they are transferred to troughs and raceways where they are trained to feed on trout granules. Young walleye are currently trough reared until they reach about 100 mm. Compared to pond rearing walleye to 100 mm, survival to this size can be improved by at least 6 fold by incorporating the trough rearing phase in the rearing period.--Copyright 1972, Biological Abstracts, Inc.

DEVELOPMENT AND OPERATION EFFICIENCY OF A CATFISH GRADER,
National Marine Fisheries Service, Rohwer, Ark.
D. C. Greenland, and R. L. Gill.
Prog Fish-Cult. Vol. 34 No. 2: p 76-80. 1972 Illus.
Identifiers: *Catfish grader, Development, Ictalurus-Punctatus, Operation, *Channel catfish, *Fish passager.

A grader to sort process-sized channel catfish (Ictalurus punctatus) was developed and tested. The unit was constructed of 8-ft-long horizontal bars having 1.75 in clear spacing. These bars were suspended 2 to 3 in. under the water surface. Fish were dumped onto one end of the grader. Smaller fish maneuvered between the bars and removed themselves from the population. Larger fish swam the length of the grader searching for an escape route and passed off the end. The addition of diverters installed at right angles to the grader bars caused larger fish to pass through the grader. Grading error was determined in vat tests and the minimum error, 15% , occurred when separating out fish 0.9 lb and larger. Fish size could be manipulated by changing bar spacing and adding the diverters.--Copyright (c) 1972, Biological Abstracts, Inc.

POTENTIALS OF THE REDEAR SUNFISH X GREEN SUNFISH HYBRID IN POND MANAGEMENT,
Southern Illinois Univ., Carbondale. Fisheries Research Lab.
R. C. Heidinger, and W. M. Lewis.
Prog Fish-Cult. Vol. 34, No. 2, p 107-109. 1972.
Identifiers: Hybrids (Sunfish), Lepomis-Cyanellus, Lepomis-Microlophus, Micropterus-Salmoides, Pond management, Potentials, *Sunfish (Redrear), *Sunfish (Green).

Populations of the redear sunfish (Lepomis microlophus) X green sunfish (L. cyanellus) F1 hybrid were produced both by stocking F1 fish and by stocking male redear sunfish and female green sunfish in farm ponds. The F1 fish, stocked at 1000/acre, attained weights of 0.6 and 0.7 lb by the end of their third summer. No F2 fish were observed to have survived. In ponds in which parental fish were stocked, F1 fish were produced each year. No back crosses and no F2 fish were observed to have been produced. The first yr. class of F1 fish attained a weight of 0.4 to 0.5 lb. by the end of the third summer. Largemouth bass (Micropterus salmoides) populations were produced along with the hybrid populations by stocking fingerling fish at the end of the summer following the spawn of the parental sunfish or introduction of F1 fish.--Copyright (c) 1972, Biological Abstracts, Inc.

CHANGE IN BODY WEIGHT CAUSED BY HANDLING AND EXERCISE IN FISH,
Hawaii Univ., Honolulu. Dept. of Zoology.
E. D. Stevens.
J Fish Res Board Can. Vol 29, No 2, p 202-203. 1972. Illus.
Identifiers: Acclimation, *Body weight (Fish), *Fish handling, *Fish exercise.

Either handling or exercise cause an increase in body weight in fish acclimated to freshwater, and a decrease in body weight in fish acclimated to sea water.--Copyright 1972, Biological Abstracts, Inc.

A SIMPLE ELECTRONIC SMOLT COUNTER,
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
D. M. Weiss.
J Fish Biol, Vol 4, No 2, p 257-260, 1972, Illus.
Identifiers: Electronic counter, Salmon, *Smolt counter, *Fish migration, Fish stocks.

The development of methods for the automatic counting of migratory fish has become a matter of some importance in the United Kingdom and elsewhere, owing to the increasing concern over the lack of accurate information about fish stocks. An instrument capable of counting fish accurately and reliably in a variety of conditions remains a goal towards which progress is being made only slowly, despite strenuous efforts by a number of organizations. The fish counters available at present are expensive to buy and sufficiently complex to be difficult to build by the majority of workers in fisheries management, there are, however, circumstances where fish may be counted by relatively simple means and an example is given. Salmon smolts swimming down a channel or tube could be reliably detected using a simple electronic circuit which was sensitive both to changes in resistance across 2 electrodes set in the water flow, and to the rate of change of resistance. These changes were amplified sufficiently to produce deflections on a recording meter so that subsequent examination of the chart gave both a count of the smolts and also the time of passage. Details of the circuit, which can be built at low cost and with only elementary equipment, are discussed briefly and some results are given.--Copyright 1972, Biological Abstracts, Inc.
W73-12332

EFFECTS OF THE FLOY ANCHOR TAG ON THE GROWTH AND SURVIVAL OF BROOK TROUT (SALVELINUS FONTINALIS),
Wisconsin Dept. of Natural Resources, Waupaca.
R. F. Carline, and O. M. Brynildson.
J Fish Res Board Can, Vol 29, No 4, p 458-460, 1972.
Identifiers: *Brook trout, Growth, Salvelinus-Fontinalis, Survival, *Tags (Floy anchor).

Two field trials were conducted to determine the effects of the gun-injected, Floy anchor tag (FD-67) on growth and survival of 10-mo.-old domesticated S. frontinalis in a 0.7 ha pond. Trials ran from Oct. to the following June. In 1968 106 tagged trout and 1005 controls, and in 1969, 300 tagged trout and 500 controls were stocked. Different fins were removed from each to determine tag loss. In both trials the trout were sampled twice through the ice and twice during open water. The tags retarded growth of the trout from Oct. to Jan.; differences in growth rates between tagged and controls were 18 and 28% for the 1968 and 1969 trials, respectively. After Jan. both groups grew at similar rates. The tags did not affect survival, and tag losses were 5.7 and 2% for the 2 trials.--Copyright 1972, Biological Abstracts, Inc.

09. MANPOWER, GRANTS AND FACILITIES

9C. Research Facilities

ENVIRONMENTAL RESEARCH LABORATORIES IN THE FEDERAL GOVERNMENT--AN INVENTORY, VOLUMES I AND II,
Syracuse Univ. Research Corp., N. Y. Policy Inst.
A. H. Teich, P. H. Howard, and L. Sumnicht.
Available from NTIS, Springfield, Va 22151 as PB-209 751 and PB-209 752. Price $6.00 each volume, printed copy. September 1971. 978 p, 2 append. NSF Grant GI-35.

Descriptors: *Environmental control, *Federal Government, *Administrative agencies, Research facilities, Reviews, Indexing, Laboratories, On-site laboratories, Pollution, Pollution abatement, Water pollution control.
Identifiers: *U.S. Agencies, *Environmental research laboratories, Earth resources.

This inventory presents detailed information on the whole range of existing in-house capabilities in environmental research in the Federal Government. The two-volume report contains data on about 170 Federal laboratories. The inventory is unique in the scope and depth of its coverage of Federal research activities at the field level. It is accompanied by a user's guide and a detailed index. Volume I includes Federal Government agencies alphabetically from Agricultural Research Service through U.S. Air Force. Volume II includes agencies from U.S. Army through U.S. Coast Guard. (Woodard-USGS)

ENVIRONMENTAL LAW ABSTRACTS, VOLUME II,
Oak Ridge National Lab., Tenn. Environmental Information Systems Office.
J. W. Curlin, and J. D. Jones.
Report ORNL-EIS-72-9, November 1972. 195 p. NSF-AAA-R-4-79.

Descriptors: *Water law, *Abstracts, *Documentation, *Bibliographies, Publications, Water pollution control, Environmental protection, Water resources, Planning.

This user-oriented research project of the Oak Ridge National Laboratory produced in collaboration with the University of Tennessee College of Law, is an attempt to bridge the communication gap between scientists and lawyers. The bibliography is useful to those in the legal profession who are concerned with environmental problems. Bibliographic citations, abstracts, and key words describing the literature are in a format which is designed for computer retrieval by key words. Comprehensive and extensive treatment is given to air pollution, drainage, environmental control, forests, marine resources, natural resources, pollution, public lands, regional planning, science, zoning, territorial waters, and watercourses. In addition, agriculture, city planning, easements, eminent domain, mines, the nuclear industry, oil and gas, real property, space law, state agreements, and treaties are scanned for pertinent environmental titles. The thesaurus is organized under descriptor subdivisions and for maximum flexibility and economy of retrieval, some key words have compound entries. An author index is also included. (Mockler-Florida)
W73-11998

WATER PUBLICATIONS OF STATE AGENCIES. A BIBLIOGRAPHY OF PUBLICATION ON WATER RESOURCES AND THEIR MANAGEMENT PUBLISHED BY THE STATES OF THE USA.
Water Information Center: Port Washington, N.Y. 1972. 319 p, Illus. Pr $39.50. G. J. Giefer, and D. K. Tood, editors.
Identifiers: *Bibliographies, Books, Management, Publications, *State agencies, Water resources.

The publication information given here is largely that supplied by the agencies themselves. The bibliographic format employed by each agency has been retained, and an address is given for every state agency listed. Brief introductory statements with information as to availability and price of publications have been included where they were supplied. The water resources research centers established in each state under Public Law 88-376 have been included. Agricultural experiment stations, agricultural extension service agencies, and interstate agencies are omitted. In those cases where the orientation of an agency includes water as only one element in a broader spectrum, only those titles from their publications were included which were directly related to water resources. In the case of State Department of Fisheries, titles are listed which reflect a close association between the fishery resource and the water resource; the same criterion was applied in regard to wildlife.—Copyright 1973, Biological Abstracts, Inc.

ATLANTIC COASTAL PLAIN
Coastal Plains Regional Commission--Annual Report, 1972.
W73-11974 6E

ATLANTIC OCEAN
Geotechnical Properties of Ocean Sediments Recovered with Giant Piston Corer: 1. Gulf of Maine,
W73-12085 2J

ATMOSPHERIC AIR
Activated Sludge Sewage Treatment Process and System,
W73-11892 5D

ATOMIC PLANTS
National Accelerator Laboratory, Batavia, Illinois. (Environmental Statement).
W73-11902 5C

ATTITUDES
Surveys Required to Design Nonstructural Measures,
W73-12005 6F

ATTRIBUTES
Graphs, Tables and Discussion to Aid in the Design and Evaluation of an Acceptable Sampling Procedure Based on Cumulative Sums,
W73-12111 5A

AUSTRALIA (NINETY-MILE DESERT)
'Desert' Becomes 'Downs:' The Impact of a Scientific Discovery,
W73-12047 4A

AUSTRALIA (QUEENSLAND)
Nitrogen Fertilizer Responses of Heteropogon Contortus and a Paspalum Plicatulum Pasture in Relation to Rainfall in Central Coastal Queensland,
W73-12341 3F

AUTOCORRELATION COEFFICIENTS
Reduction of Uncertainties in Autocorrelation by the Use of Physical Models,
W73-12283 2A

AUTOMATIC METER READING
Automatic Meter Reading Using Existing Telephone Circuits,
W73-12145 5A

AUTORADIOGRAPHY
Isolation and Characterization of Thermosensitive Escherichia coli Mutants Defective in Deoxyribonucleic Acid Replication,
W73-12110 5A

AVALANCHES
At Institutes of the Hydrometeorological Service (V uchrezhdeniyakh Gidrometsluzhby),
W73-12059 2C

BABINE RIVER
Observations on the Migration of Sockeye Salmon Fry (Oncorhynchus Nerka) in the Lower Babine River,
W73-11747 8I

BACILLUS MEGATERIUM
Location and Consequences of 1,1,1-Trichloro-2,2-Bis (P-Chlorophenyl) Ethane Uptake by Bacillus Megaterium,
W73-12091 5B

BACTERIA
Evidence for Two Light-Driven Reactions in the Purple Photosynthetic Bacterium, Rhodospirillum Rubrum,
W73-11948 5C

BACTERIAL PHYSIOLOGY
Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

BACTERIOPHAGE
Typing of Salmonella Weltevreden Strains by Means of Lysis Patterns of Symbiotic Phages,
W73-12121 5A

BAETIS BUNDYI
A New Species of Baetis (Ephemeroptera) From Ponds in the Canadian Arctic, with Biological Notes,
W73-12157 5A

BALANCE OF NATURE
Chemostasis and Homeostasis in Aquatic Ecosystems: Principles of Water Pollution Control,
W73-11935 5C

Effects of Deforestation on Water Quality,
W73-11945 4C

BALTIC SEA
On The Ground-Water Discharge to the Baltic Sea and Methods for Estimating It,
W73-11843 2F

BANK EROSION
Criteria for Stable Earth Channel Design,
W73-11746 8B

BANK PROTECTION
Erosion Prevention During Highway Construction by the Use of Sprayed on Chemicals,
W73-11855 5G

BANK STABILIZATION
Development of Dwarf Ground Cover for Erosion Control in Colorado,
W73-12071 4D

BARATARIA BAY (LA)
Interstitial Water Composition in Barataria Bay (Louisiana) Sediment,
W73-12302 2L

BARLEY-M SEEDS
Effect of Pre-Sowing Exposure of Seeds to Gamma Radiation on the Drought Resistance Behavior of Barley Plants (Hordeum vulgare L.),
W73-11953 3F

BARROW COUNTY (GEORGIA)
A Water and Sewer Plan: Barrow County, Georgia.
W73-12014 5D

BASE FLOW
Reduction of Uncertainties in Autocorrelation by the Use of Physical Models,
W73-12283 2A

BASIC DATA COLLECTIONS
Great Lakes Water Levels, 1970, Daily and Monthly Average Water Surface Elevations.
W73-12298 7C

BASS
Nesting Bass Observed with Underwater Television,
W73-11864 5A

BATHYMETRY
Disposition of Spoil on the Dump Site,
W73-12318 5E

Hypsometry of Lower Chateaugay Lake and a Pond on the Saranac River,
W73-12327 2H

Hypsometric Map of Harris Lake, New York,
W73-12328 2H

BAYESIAN DESIGN METHODS
Environmental Control Systems: Treatment of Uncertainty in Models and Data,
W73-12271 6A

BAYESIAN ESTIMATION
Bayesian Estimation and Design of Experiments for Growth Rates, With Applications to Measuring Water Quality,
W73-12270 5A

BAYS
A Field Investigation of Rollover Fish Pass, Bolivar Penninsula, Texas,
W73-11854 8B

Movement and Quality of Long Island Sound Waters, 1971,
W73-12072 2K

Sediment Distribution in Southwestern Delaware Bay,
W73-12308 2L

BEACH EROSION
The Coastal Challenge,
W73-11810 2L

Brevard County Beach Erosion Control Project (Final Environmental Impact Statement).
W73-11997 8A

Nearshore Currents and the Equilibrium Cuspate Shoreline,
W73-12075 2J

BEACHES
The Coastal Challenge,
W73-11810 2L

Nearshore Currents and the Equilibrium Cuspate Shoreline,
W73-12075 2J

BEARING CAPACITY
Bearing Capacity Theory from Experimental Results,
W73-11718 8D

BED LOAD
Some Aspects of the Geomorphology of Meltwater Streams, Steele Glacier Terminus,
W73-11794 2C

Bed Forms of the Mediterranean Undercurrent Observed With Side-Scan Sonar,
W73-12300 2L

BEDS UNDER WATER
Marine Sanctuaries in California.
W73-11973 6E

Exploitation of Seabed Mineral Resources--Chaos or Legal Order,
W73-12210 6E

BENECKA
Deoxyribonucleic Acid Base Composition and Taxonomic Position of Glucose Fermenting Marine Bacteria of the Genus Vibrio and Related Genera, (Composition en Bases de L'Adn et Position Taxonomique de Bacteries Marines Fermentant le Glucose, du Genre Vibrio et des Genres Voisins),
W73-12090 5A

BENECKEA SPP
Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

BENEFITS
Report of Hydroelectric Subproject,
W73-11888 6B

BENTHIC INVERTEBRATES
Some Conservational Problems Posed by Hydroelectric Power Installations in Alberta,
W73-12268 5C

BIBLIOGRAPHIES
Annotated Bibliography on 14-MEV Neutron Activation Analysis,
W73-11919 5A

Environmental Law Abstracts, Volume II,
W73-11998 10C

Water Publications of State Agencies. A Bibliography of Publication on Water Resources and Their Management Published by the States of the USA.
W73-12161 10C

Rhode Island Marine Bibliography.
W73-12316 2L

Dissolved Organic Matter in Natural Waters: A Selected Bibliography, with Emphasis on Analytical Methods,
W73-12329 2H

BIG BLUE RIVER (KANSAS AND NEBRASKA)
Kansas-Nebraska Big Blue River Compact.
W73-11972 6E

BIG CYPRESS SWAMP
Big Cypress Preserve, Florida.
W73-11993 6E

BIGHORN GLACIER (MONT)
Comparison of Moraines Formed by Surging and Normal Glaciers,
W73-11793 2C

BIOACCUMULATION
Location and Consequences of 1,1,1-Trichloro-2,2-Bis (P-Chlorophenyl) Ethane Uptake by Bacillus Megaterium,
W73-12091 5B

Accumulation of Dieldrin in an Alga (Scenedesmus Obliquus), Daphnia Magna and the Guppy (Poecilia Reticulata),
W73-12098 5B

BIOASSAY
The Toxicity of Heavy Metals to Embryos of the American Oyster Crassostrea virginica,
W73-12113 5C

Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

The Effects of Chlorination of Wastewater on Fertilization in Some Marine Invertebrates,
W73-12117 5C

Effect of Zinc on Growth and Development of Larvae of the Pacific Oyster Crassostrea gigas,
W73-12118 5C

Studies on Factors Affecting Survival of Nile Fish in the Sudan. I. The Effect of Hydrogen Ion Concentration,
W73-12131 5C

Studies on Factors Affecting Survival of Nile Fish in the Sudan. II. The Effect of Temperature,
W73-12132 5C

Studies on Factors Affecting Survival of Nile Fish in the Sudan. III. The Effect of Oxygen,
W73-12133 5C

Sites of Nutrient Absorption in Aquatic Macrophytes,
W73-12134 5C

Initial Studies on a Method of Algal Assay for Nutrient Parameters in Water,
W73-12158 5A

BIOCHEMICAL CHARACTERISTICS
Morphological, Biochemical, and Growth Characteristics of Pseudomonas cepacia from Distilled Water,
W73-12103 5A

Isolation of New Methanol-Utilizing Bacteria and its Thiamine-Requirement for Growth,
W73-12122 5A

BIOCHEMICAL OXYGEN DEMAND
Anaerobic-Aerobic Treatment of Textile Wastes with Activated Carbon,
W73-11715 5D

Internal Precipitation of Phosphate in Settling Zone,
W73-11879 5D

BIOCHEMICAL TESTS
Carbon Source Utilization Tests as an Aid to the Classification of Non-Fermenting Gram-Negative Bacteria,
W73-12140 5A

BIOCHEMICAL TREATMENT
Submerged Filter-Horizontal Flow Mode,
W73-11885 5D

BIOCHEMISTRY
The Kinetics of Simultaneous Glucose and Xylose Utilization by Rhodotorula Rubra,
W73-11934 5C

Evidence for Two Light-Driven Reactions in the Purple Photosynthetic Bacterium, Rhodospirillum Rubrum,
W73-11948 5C

Some Factors Influencing Kinetic Constants for Microbial Growth in Dilute Solution,
W73-11956 5C

BIOINDICATORS
Activation Analysis of Mercury in Biological Samples,
W73-12260 5A

BIOLOGICAL TREATMENT
Waste Water Treatment System,
W73-11878 5D

Internal Precipitation of Phosphate in Settling Zone,
W73-11879 5D

Management of Recycled Waste-Process Water Ponds,
W73-11889 5D

BIOMASS
Plankton Diatom Species Biomasses and the Quality of American Rivers and the Great Lakes,
W73-11942 5C

Net Plankton and Nanoplankton Production and Biomass in a North Temperate Zone Lake,
W73-11951 5C

Studies on Freshwater Micro-Organisms: Phosphatase Activity in Lakes of Differing Degrees of Eutrophication,
W73-12089 5C

BIOMES
Implications of a Systems Approach to Oceanography,
W73-11868 6A

Modeling in the Eastern Deciduous Forest Biome,
W73-11907 2E

BIOSYNTHESIS
Effect of Nitrate, Ammonia and Nitrogen Starvation on the Regulation of Nitrate Reductase in Cyanidium Caldarium,
W73-12130 5C

BIOTA
Distribution of Mercury, Cadmium, Lead and Thallium in a Eutrophic Lake,
W73-11707 5B

BIVALVES
On the Water Quality of Lake Biwa-Ko and the Inhabitability of the Bivalve, Corbicula Sandai, In the Seta River, (In Japanese),
W73-12344 5C

BLUEGILL SUNFISH
Revised Food Consumption Estimate of a Bluegill Sunfish Population in Wyland Lake, Indiana, USA,
W73-12046 2H

BOATING REGULATIONS
Operation of Watercraft.
W73-11982 6E

BOATS
Operation of Watercraft.
W73-11982 6E

BODIES OF WATER
Thermal Regime of Freezing Bodies of Water (Termika zamerzayushchikh vodoyemov),
W73-11858 2C

BODY WEIGHT (FISH)
Change in Body Weight Caused by Handling and Exercise in Fish,
W73-12312 8I

BOILING-WATER REACTORS
Final Environmental Statement Related to the Proposed Hanford Number Two Nuclear Power Plant.
W73-11917 5C

Final Environmental Statement Related to Operation of Pilgrim Nuclear Power Station.
W73-11928 5C

Final Environmental Statement Related to Operation of Vermont Yankee Nuclear Power Station.
W73-11932 5C

BONAVISTA BAY (NF)
Growth Per Moult of Tagged Lobsters (Homarus americanus) in Bonavista Bay, Newfoundland,
W73-11914 8I

BOTTOM SEDIMENTS
In Situ Sampler for Marine Sedimentary Pore Waters: Evidence for Potassium Depletion and Calcium Enrichment,
W73-11840 7B

Geotechnical Properties of Ocean Sediments Recovered with Giant Piston Corer: 1. Gulf of Maine,
W73-12085 2J

Chemical Variations in Sedimentary Facies of an Inner Continental Shelf Environment, Northern Gulf of Mexico,
W73-12299 2J

Bed Forms of the Mediterranean Undercurrent Observed With Side-Scan Sonar,
W73-12300 2L

Interstitial Water Composition in Barataria Bay (Louisiana) Sediment,
W73-12302 2L

BOUND WATER
Bound Water In Disperse Systems (Svyazannaya voda v dispersnykh sistemakh).
W73-11857 1A

BOUNDARIES (PROPERTY)
Richardson V. Schneider (Action Involving Dispute as to Ownership of Peninsula which Jutted Into Lake).
W73-12000 6E

BOUNDARY DISPUTES
Richardson V. Schneider (Action Involving Dispute as to Ownership of Peninsula which Jutted Into Lake).
W73-12000 6E

BP 1002
Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

BRACKISH WATER
Desalting in the Arid Regions,
W73-12244 3A

BRAIDING
The Sedimentology of a Braided River,
W73-11808 2J

BREAKDOWN
The Sparking of Lightning Arresters Due to Conductive Contaminants,
W73-11722 8C

BREVARD COUNTY (FLA)
Brevard County Beach Erosion Control Project (Final Environmental Impact Statement).
W73-11997 8A

BRIDGE DESIGN
Deflections of Prestressed Concrete Bridges in Japan,
W73-11735 8F

BRINE DISPOSAL
Final Disposal of Effluent Brines from Inland Desalting Plants,
W73-11749 5E

BROOK TROUT
Recovery of Planted Brook Trout, Splake, and Rainbow Trout from Selected Ontario Lakes,
W73-11940 8I

Effects of the Floy Anchor Tag on the Growth and Survival of Brook Trout (Salvelinus fontinalis),
W73-12336 8I

BRYOPHYTES
Studies of the Spray Zone of Churchill Falls, Labrador,
W73-12162 2I

Bryophytes as a Guide to Mineralisation,
W73-12337 2I

BUBBLES
Sonic Cavitation Studies on Model and Prototype Water Turbines,
W73-11720 8C

BULGARIA
Patterns of Stream-Discharge Variability (Zakonomernosti v izmenenii modulya stoka),
W73-12056 2E

BURIED PIPES
Application of Cathodic Protection,
W73-11736 8G

BURIED STRUCTURES
Application of Cathodic Protection,
W73-11736 8G

BURLINGTON COUNTY (NEW JERSEY)
Natural Features in Burlington County.
W73-12241 6G

BUTANE
Freezing Process Studies: Butane Stripping in Sprays and Evaporation of Butane Drops,
W73-11752 3A

BUTOMUS-UMBELLATUS-M
Butomus Umbellatus in the Mississippi Watershed,
W73-12176 2I

CADDISFLIES
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

CADMIUM
Distribution of Mercury, Cadmium, Lead and Thallium in a Eutrophic Lake,
W73-11707 5B

Cadmium Content of Sea Water, Bottom Sediment and Fish, and Its Elimination Rate in Fish,
W73-12264 5B

CALCIUM CARBONATE
Cation Transport in Soils and Factors Affecting Soil Carbonate Solubility,
W73-11714 5B

CALIFORNIA
Orange County Water District's Water Factory 21,
W73-11719 5D

Hydrologic Data: 1971, Volume V: Southern California.
W73-11846 2E

Current Slope-Stability Studies in the San Francisco Bay Region,
W73-12065 2J

The Technology of Solid Waste Management--Implications for State Policy.
W73-12193 5G

Analysis of Streamflow Forecasting Uncertainty,
W73-12277 4A

Uncertainties in Point and Areal Sampling of Precipitation and Their importance in Hydrologic Computations,
W73-12290 2B

CALIFORNIA (INGLENOOK FEN)
A Fen on the Northern California Coast,
W73-12350 2L

CALIFORNIA (TULELAKE)
Alkali Bulrush Seed Germination and Culture,
W73-12165 2I

CANADA
Observations on the Migration of Sockeye Salmon Fry (Oncorhynchus Nerka) in the Lower Babine River,
W73-11747 8I

Steele Glacier, 1935-1968,
W73-11791 2C

Movement Observations on the Terminus Area of the Steele Glacier, July 1967,
W73-11792 2C

Observations of the Surge of Steele Glacier,
W73-11796 2C

Current Water Use Requirements in the Qu'Appelle River Basin,
W73-12232 6D

Report on Water Supply Study of Certain Urban Communities in the Qu'Appelle River Basin.
W73-12233 6D

CANADA (ALBERTA)
Some Conservational Problems Posed by Hydroelectric Power Installations in Alberta,
W73-12268 5C

CANADA (BRITISH COLUMBIA)
Fertilization of Pink Salmon (Oncorhynchus gorbuscha) Ova by Spermatozoa from Gonadotropin- injected Juveniles,
W73-11866 8I

CANADA (NEWFOUNDLAND)
Growth Per Moult of Tagged Lobsters (Homarus americanus) in Bonavista Bay, Newfoundland,
W73-11914 8I

CANADA (QUEEN CHARLOTTE ISLAND)
Morphology, Life History, and Ecology of an Unusual Stickleback (Gasterosteus Aculeatus) in the Queen Charlotte Islands, Canada,
W73-12177 2I

CANAL CONSTRUCTION
Channel Conditions, Devil's Island Reach, Mississippi River, Missouri and Illinois,
W73-11821 8B

CANAL REPAIR
Watercourses--Canals--Toll Bridges,
W73-12221 6E

CANALS
New Continuous-Flow Process for Blast-Hole Drilling in Hydraulic-Engineering, Reclamation, and Water-Resources Construction,
W73-11733 8H

Determining the Best Sizes of the Open Cut Canals Used in Hydroameliorations,
W73-11870 6A

Watercourses--Canals--Toll Bridges,
W73-12221 6E

CANE RIVER FORMATION
Hydrologic Significance of Lithofacies of the Cane River Formation or Equivalents of Arkansas, Louisiana, Mississippi, and Texas,
W73-12053 2F

CAPE COD BAY (MASS)
Final Environmental Statement Related to Operation of Pilgrim Nuclear Power Station.
W73-11928 5C

CAPE COD (MASS)
The Environmental Impact of Ground Water use on Cape Cod--Impact Study No. 3,
W73-12303 5B

CARBOHYDRATES
The Kinetics of Simultaneous Glucose and Xylose Utilization by Rhodotorula Rubra,
W73-11934 5C

CARBON
Decomposition of Dissolved Organic Carbon and Nitrogen Compounds from Leaves in an Experimental Hardwater Stream,
W73-11962 5C

The Transformation of Nitrogen and Carbon in the Soil During Humification of Straw Labelled with N15,
W73-12342 2G

CARBON-14
The Evaluation and Application of C-14 Dating of Groundwater,
W73-12297 2F

CARBON PASTE ELECTRODE
Carbon Paste Electrode with a Wide Anodic Potential Range,
W73-12142 5A

CARBON RADIOISOTOPES
The Evaluation and Application of C-14 Dating of Groundwater,
W73-12297 2F

CARBON REACTIVATION
Adsorption and Filtration with Granular Activated Carbon,
W73-12190 5F

CARBON SOURCE UTILIZATION TESTS
Carbon Source Utilization Tests as an Aid to the Classification of Non-Fermenting Gram-Negative Bacteria,
W73-12140 5A

CARBONATE SOLUBILITY
Cation Transport in Soils and Factors Affecting Soil Carbonate Solubility,
W73-11714 5B

CARP
Studies on Carp Culture in Running Water Pond: IV. On Relation Between Diurnal Change of Water Qualities in the Fish Pond and Decrease of Fish Feeding (In Japanese),
W73-12174 8I

CARPATHIANS
Formation and Computation of Components in a River Regime (Formirovaniye i raschety elementov rezhima rek).
W73-11825 2A

Maximum Flood Discharges and Depths of Runoff on Carpathian Rivers (Maksimal'nyye raskhody i sloi pavodochnogo stoka rek Karpat),
W73-11826 2E

Design Characteristics of Storm Precipitation in the Carpathians (Raschetnyye kharakteristiki dozhdevykh osadkov v Karpatakh),
W73-11827 2B

Possibility of Using Storage Precipitation Gages to Improve the Accuracy of Precipitation Data in the Ukrainian Carpathians (O vozmozhnosti utochneniya kolichestva osadkov v Ukrainskikh Karpatakh po dannym summarnykh osadkomerov) ,
W73-11828 2B

Role of Natural and Anthropogenic Factors in Mudflow Formation in the Ukrainian Carpathians (O roli prirodnykh i antropogennykh faktorov v seleobrazovanii v Ukrainskikh Karpatakh),
W73-11830 2J

CATALYSTS
An Investigation of Tritium Decontamination,
W73-11925 5D

CATFISH GRADER
Development and Operation Efficiency of a Catfish Grader,
W73-12248 8I

CATHODIC PROTECTION
Application of Cathodic Protection,
W73-11736 8G

CATIONS
Studies of Cation Budgets in the Southern Appalachians on Four Experimental Watersheds with Contrasting Vegetation,
W73-11860 2E

CATTLE
Manure Slurry Irrigation System Receiving Lot Runoff,
W73-11767 5D

CAUCASUS
At Institutes of the Hydrometeorological Service (V uchrezhdeniyakh Gidrometsluzhby),
W73-12059 2C

CAVITATION
Sonic Cavitation Studies on Model and Prototype Water Turbines,
W73-11720 8C

CECIL SOIL
Effects of Irrigation and Fertilization on Yields and Chemical Composition of Corn and on the Changes in the Available K Contents of a Cecil Soil,
W73-12343 3F

CELL MORPHOLOGY
Morphological, Biochemical, and Growth Characteristics of Pseudomonas cepacia from Distilled Water,
W73-12103 5A

Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

CELLULOSE ACETATE
Differential Scanning Calorimetry of Cellulose Acetate,
W73-11755 3A

Diffusion of Sodium Chloride in Cellulose and Amylose Acetates,
W73-11758 3A

Water Diffusion through Cellulose and Amylose Acetates,
W73-11759 3A

Water Vapor Sorption in Cellulose and Amylose Acetates,
W73-11760 3A

Reverse Osmosis Studies of Cellulose and Amylose Acetates,
W73-11761 3A

CELLULOSE TRIACETATE
Monomolecular Film Properties of Cellulose and Amylose Triacetates at the Air-Water Interface,
W73-11756 3A

Reverse Osmosis Studies of Cellulose and Amylose Acetates,
W73-11761 3A

CENTRIFUGATION
Centrifuge Testing for Models of Soil Structures,
W73-11745 8D

Method and Apparatus for Separating Water from a Mixture of a Granular Material and Water,
W73-11875 5G

Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

CERIUM
A Polythene Graphite Electrode for Voltammetry,
W73-12097 5A

CHANGE OF BIOMASS
Influence of Dilution, Sinking and Grazing Rate on Phytoplankton Populations of Hyperfertilized Ponds and Microecosystems,
W73-11950 5C

CHANNEL CATFISH
Development and Operation Efficiency of a Catfish Grader,
W73-12248 8I

CHANNEL EROSION
Criteria for Stable Earth Channel Design,
W73-11746 8B

CHANNEL IMPROVEMENT
Shoaling Conditions, St. Louis Harbor, Mississippi River,
W73-11856 8B

Watercourses--Canals--Toll Bridges,
W73-12221 6E

CHANNEL IMPROVEMENTS
Red River Emergency Bank Protection, Louisiana, Arkansas, and Texas (Final Environmental Impact Statement).
W73-12196 4A

CHANNEL MORPHOLOGY
Supraglacial Streams of the Kaskawulsh Glacier,
W73-11805 2C

The Sedimentology of a Braided River,
W73-11808 2J

The Meandering of Alluvial Rivers,
W73-11844 2J

Numerical Model Studies of the St. Lawrence River,
W73-12313 2L

CHANNELS
Channel Conditions, Devil's Island Reach, Mississippi River, Missouri and Illinois,
W73-11821 8B

CHAOBORUS PUNCTIPENNIS
The Light Threshold Controlling the Vertical Migration of Chaoborus Punctipennis in a Georgia Impoundment,
W73-11943 5C

CHARACTERIZATION
Isolation and Characterization of Thermosensitive Escherichia coli Mutants Defective in Deoxyribonucleic Acid Replication,
W73-12110 5A

Typing of Salmonella Weltevreden Strains by Means of Lysis Patterns of Symbiotic Phages,
W73-12121 5A

Partial Characterization of Mycobacteriophage R1 Particles Surviving Chloroform Treatment,
W73-12124 5A

Characterization of Thiobacillus Species by Gas-Liquid Chromatography of Cellular Fatty Acids,
W73-12127 5A

Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

The Taxonomic Position of Obesumbacterium Proteus, a Common Brewery Contaminant,
W73-12149 5A

CHATEAUGAY LAKE (NY)
Hypsometry of Lower Chateaugay Lake and a Pond on the Saranac River,
W73-12327 2H

CHEMICAL ANALYSIS
Potomac Estuary Wastewater Treatment Plants Survey.
W73-12076 5D

Water Quality Survey of the Potomac Estuary Embayments and Transects.
W73-12077 5A

Water Quality of the Potomac Estuary Gilbert Swamp and Allen's Fresh and Gunston Cove.
W73-12078 2K

Survey Results of the Chesapeake Bay Input Study.
W73-12079 5A

Accumulation of Dieldrin in an Alga (Scenedesmus Obliquus), Daphnia Magna and the Guppy (Poecilia Reticulata),
W73-12098 5B

CHEMICAL GROUTS
Basic Relationships Affecting the Planning of Single-Phase Chemical Ground Stabilization,
W73-11729 8G

CHEMICAL OXYGEN DEMAND
Anaerobic-Aerobic Treatment of Textile Wastes with Activated Carbon,
W73-11715 5D

CHEMICAL PRECIPITATION
The Alumina-Lime Soda Water Treatment Process,
W73-11748 3A

CHEMICAL PRETREATMENT
The Alumina-Lime Soda Water Treatment Process,
W73-11748 3A

CHEMICAL PROPERTIES
Time to Chemical Steady-States in Lakes and Oceans,
W73-11936 2K

CHEMICAL REACTIONS
Direct Observation of Reversible Formation of Anionic Sigma Complexes Related to Transition State Analogs for Adenosine Deaminase,
W73-11852 1B

Apparatus and System for Removal of Latex from Waste Water,
W73-11874 5D

Entomological Special Study No. 44-013-72/73, Laboratory Evaluation of Residues Maintained in Water Treated With Polyethylene Formulations of Chlorpyrifos, December 1971-April 1972,
W73-12042 5F

Angular Dependence of Substituent Effects in Rigid, Bicyclic Systems,
W73-12305 2K

CHEMICAL STEADY-STATES
Time to Chemical Steady-States in Lakes and Oceans,
W73-11936 2K

CHEMICAL TREATMENT
Apparatus and System for Removal of Latex from Waste Water,
W73-11874 5D

Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

CHEMOSTASIS
Chemostasis and Homeostasis in Aquatic Ecosystems: Principles of Water Pollution Control,
W73-11935 5C

CHEMOSTAT
Silicon and the Ecology of Marine Plankton Diatoms. I. Thalassiosira pseudonana (Cyclotella nana) Grown in a Chemostat with Silicate as Limiting Nutrient,
W73-12119 5C

CHEREMOSH RIVER
Investigation of Mudflows in the Cheremosh River Basin in Connection with Design of the Rostoki Reservoir (Issledovaniye seley v basseyne r. Cheremosh v svyazi s proyektirovaniyem Rostokinskogo vodokhranilishcha),
W73-11831 2J

CHESAPEAKE BAY
Survey Results of the Chesapeake Bay Input Study.
W73-12079 5A

Vibrio Parahaemolyticus-Isolation, Identification, Classification, and Ecology,
W73-12144 5A

CHINOOK SALMON
Habitat Selection and Spatial Interaction by Juvenile Chinook Salmon and Steelhead Trout in Two Idaho Streams,
W73-12245 2I

CHITIN
Search for New Desalination Membranes,
W73-11753 3A

CHITOSAN
Search for New Desalination Membranes,
W73-11753 3A

CHLORIDES
Magnesium to Chlorinity Ratios in Seawater,
W73-12086 2K

Determination of Chloride in Aqueous Soil Extracts and Water Samples by Means of a Chloride-Selective Electrode,
W73-12088 5A

CHLORINATED HYDROCARBON PESTICIDES
Effects of Pesticides on Blue-Green Algae,
W73-12128 5C

CHLORINATION
Nitrogen Removal from Waste Water by Breakpoint Chlorination,
W73-11890 5D

The Effects of Chlorination of Wastewater on Fertilization in Some Marine Invertebrates,
W73-12117 5C

CHLOROPHYLL
On the Photodecomposition of Chlorophyll in Vitro,
W73-12146 5C

CHLOROPHYLL A
The Effects of Ammonium and Phosphate Enrichments on Chlorophyll A, Pigment Ratio and Species Composition of Phytoplankton of Vineyard Sound,
W73-12116 5C

CHLOROPHYTA
Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

CHLORPYRIFOS
Entomological Special Study No. 44-013-72/73, Laboratory Evaluation of Residues Maintained in Water Treated With Polyethylene Formulations of Chlorpyrifos, December 1971-April 1972,
W73-12042 5F

CHONDROCOCCUS-COLUMNARIS
Seasonal Distribution of Chondrococcus columnaris Infection in River Fishes as Determined by Specific Agglutinins,
W73-11949 5C

CITROBACTER
Potential Pathogens in the Environment: Isolation, Enumeration, and Identification of Seven Genera of Intestinal Bacteria Associated with Small Green Pet Turtles,
W73-12150 5A

CITRUS-D LEAVES
Effect of Water Stress and High Temperature on Nitrate Reduction in Citrus Leaves,
W73-12330 3F

CIVIL LIABILITY
Discharge of Untreated Wastes into the Mississippi River.
W73-12204 6E

CLAMS
Occurrence, Distribution and Density of Rangia Cuneata in Lakes Pontchartrain and Maurepas, Louisiana,
W73-11957 5C

CLARIAS-GARIEPINUS
Diversity and Abundance of Aquatic Insects Reduced by Introduction of the Fish Clarias gariepinus to Pools in Central Africa,
W73-12339 2H

CLARKE COUNTY (GEORGIA)
A Water and Sewer Plan: Clarke County, Georgia.
W73-12013 5D

CLASSIFICATION
Carbon Source Utilization Tests as an Aid to the Classification of Non-Fermenting Gram-Negative Bacteria,
W73-12140 5A

Vibrio Parahaemolyticus-Isolation, Identification, Classification, and Ecology,
W73-12144 5A

CLAYS
Effect of Clay on the Availability of Dilute Organic Nutrients to Steady-State Heterotrophic Populations,
W73-11954 5C

CLEAR-CUTTING
Hydrologic Changes After Clear-Cut Logging in a Small Oregon Coastal Watershed,
W73-12066 4C

CLIMATES
Winter and Summer Shelter for Beef Cattle in Louisiana,
W73-11768 5B

CLIMATIC DATA
Space-Time Uncertainties in Precipitation Measurement,
W73-12293 2B

CLIMATIC ZONES
Flood Evaluation - Can Stochastic Models Provide an Answer,
W73-12276 7C

CLIMATOLOGY
Oil and Ice in the Arctic Ocean: Possible Large-Scale Interactions,
W73-11839 5B

CLINCH RIVER
Radionuclides in River Systems,
W73-12259 5B

CLOSED CONDUIT FLOW
Resistance Losses in Noncircular Flood Control Conduits and Sluices,
W73-12027 8B

Hydraulic Network Analysis Using Linear Theory,
W73-12041 7C

CLOSURES
Optimal Gate Closure Schedule for Hydroelectric Turbine System,
W73-11742 8C

CLOUD PHYSICS
Research in the Development and Utilization of Atmospheric Water Resources in Montana,
W73-11712 3B

CLOUD SEEDING
Research in the Development and Utilization of Atmospheric Water Resources in Montana,
W73-11712 3B

COAGULATION
Method of Removing Oil Spills from Water,
W73-11891 5G

Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

COARSE AGGREGATES
Methods for Sampling and Determining Sieve Analysis of Aggregates Larger Than One and One-Half Inch Sieve,
W73-12070 8F

COASTAL PLAINS
Louisiana Coastal Commission.
W73-12217 6E

COASTAL ZONE MANAGEMENT
Louisiana Coastal Commission.
W73-12217 6E

COASTS
The Coastal Challenge,
W73-11810 2L

The Quality of Coastal Waters: First Annual Progress Report,
W73-12295 5B

Rhode Island Marine Bibliography.
W73-12316 2L

COATINGS
Erosion Prevention During Highway Construction by the Use of Sprayed on Chemicals,
W73-11855 5G

COLD WEATHER CONSTRUCTION
New Continuous-Flow Process for Blast-Hole Drilling in Hydraulic-Engineering, Reclamation, and Water-Resources Construction,
W73-11733 8H

COLEOPTERA
Diversity and Abundance of Aquatic Insects Reduced by Introduction of the Fish Clarias gariepinus to Pools in Central Africa,
W73-12339 2H

COLIFORMS
Microbiological Quality of Surface Drainage Water from Three Small Irrigated Watersheds in Southern Idaho,
W73-12151 5C

COLIPHAGE
Resistance to Coliphage Infection Induced in Escherichia coli by Growth in the Presence of a Surfactant,
W73-12105 5C

COLLAPSE
Sonic Cavitation Studies on Model and Prototype Water Turbines,
W73-11720 8C

COLOR REACTIONS
Investigation of the Utility of Parallel Photometric Analysis as a New Approach for Environmental Determinations,
W73-11916 5A

COLORADO
Extent of Development and Hydrologic Conditions of the Alluvial Aquifer, Fountain and Jimmy Camp Valleys, Colorado, 1972,
W73-12023 2F

Simulation of Hydrologic and Chemical-Quality Variations in an Irrigated Stream-Aquifer System--A Preliminary Report,
W73-12024 2A

Development of Dwarf Ground Cover for Erosion Control in Colorado,
W73-12071 4D

Hydrogeologic Characteristics of the Valley-Fill Aquifer in the Julesburg Reach of the South Platte River Valley, Colorado,
W73-12296 2F

COLUMBIA RIVER
Final Environmental Statement Related to the Proposed Hanford Number Two Nuclear Power Plant.
W73-11917 5C

Stochastic Stream Temperature Model,
W73-12289 4A

COMBINED SEWERS
Metropolitan Water Intelligence Systems - Completion Report, Phase II,
W73-11704 5G

COMMERCIAL FISHING
Felton V. Hodges (State's Authority to Regulate Commercial Fishing Beyond Its Territorial Waters).
W73-12200 6E

COMMITTEE ON WATER LAWS (ASCE)
State Water Rights Laws,
W73-12007 6E

COMPETING USES
Oil and Gas--Rights of Mineral Lessee in Use of Surface Owner's Fresh Water for Secondary Recovery Purposes, Sun Oil V. Whitaker.
W73-12212 6E

COMPREHENSIVE PLANNING
Final Environmental Statement Related to Operation of Maine Yankee Atomic Power Station.
W73-11899 5C

Final Environmental Statement Related to Operation of Zion Nuclear Power Station Units 1 and 2.
W73-11900 5C

Final Environmental Statement Related to Operation of Surry Power Station Unit 2.
W73-11903 5C

Final Environmental Statement Related to Operation of Kewaunee Nuclear Power Plant.
W73-11904 5C

Final Environmental Statement Related to Operation of Fort Calhoun Station Unit 1.
W73-11906 5C

Final Environmental Statement Related to the Arkansas Nuclear One Unit 1.
W73-11913 5C

Final Environmental Statement Related to the Proposed Hanford Number Two Nuclear Power Plant.
W73-11917 5C

Final Environmental Statement Related to Construction of Davis-Besse Nuclear Power Station.
W73-11920 5C

Final Environmental Statement Related to Construction of Shearon Harris Nuclear Power Plant Units 1, 2, 3, and 4.
W73-11926 5C

Final Environmental Statement Related to the Proposed Crystal River Unit 3.
W73-11927 5C

Final Environmental Statement Related to Operation of Pilgrim Nuclear Power Station.
W73-11928 5C

Final Environmental Statement Related to Construction of Joseph M. Farley Nuclear Plant Units 1 and 2.
W73-11931 5C

Final Environmental Statement Related to Operation of Vermont Yankee Nuclear Power Station.
W73-11932 5C

A Water and Sewer Plan: Clarke County, Georgia.
W73-12013 5D

A Water and Sewer Plan: Barrow County, Georgia.
W73-12014 5D

Urban Systems Engineering Demonstration Program. Volume I: Goals, Objectives, and Standards for Waterworks, Sanitary Sewerage, Solid Waste Management, Storm Drainage and Flood Plain Management,
W73-12016 5D

Urban Systems Engineering Demonstration Program. Volume II: Areawide Water and Sanitary Sewerage Systems,
W73-12017 5D

Urban Systems Engineering Demonstration Program. Volume III: Areawide Solid Waste Management,
W73-12018 5E

Urban Systems Engineering Demonstration Program. Volume IV: Area wide Storm Drainage and Flood Plain Management,
W73-12019 4C

US-USSR Expertise Exchange,
W73-12255 6E

Environmental Statement, Rio Blanco Gas Stimulation Project, Rio Blanco County, Colorado.
W73-12258 5A

COMPRESSED AIR
Effects of Artificial Aeration on the Chemistry and Algae of Two Michigan Lakes,
W73-11958 5C

COMPUTER MODELS
An Evaluation of Ten Pairwise Multiple Comparison Procedures by Monte Carlo Methods,
W73-12100 5A

COMPUTERS
Development of a State Water-Planning Model, Part V, Data Bank Operators Manual,
W73-11709 6A

CONCRETE TECHNOLOGY
Control of Cracking in Concrete Structures,
W73-11728 8F

Conditions for Instability in Restrained Concrete Panels Exposed to Fire,
W73-11739 8F

CONCRETES
Control of Cracking in Concrete Structures,
W73-11728 8F

CONDEMNATION
Protection from Floods.
W73-11990 6E

CONFERENCES
At Institutes of the Hydrometeorological Service (V uchrezhdeniyakh Gidrometsluzhby),
W73-12059 2C

CONFINEMENT PENS
Confinement Feeding - Pros, Cons, and Tips,
W73-11763 5G

CONGRESSIONAL HEARING
Marine Sanctuaries in California.
W73-11973 6E

CONGRESSIONAL HEARINGS
Kansas-Nebraska Big Blue River Compact.
W73-11972 6E

Big Cypress Preserve, Florida.
W73-11993 6E

Safe Drinking Water.
W73-12205 5G

Proposed Florida Frontier Rivers National Cultural Park.
W73-12206 6E

Designating Rock Creek in Montana as Part of the Wild and Scenic Rivers System.
W73-12207 6E

CONIOSCYPHA SPP.
Fungi of the Chesapeake Bay and its Tributaries II. The Genus Conioscypha,
W73-11861 5A

CONNATE WATER
In Situ Sampler for Marine Sedimentary Pore Waters: Evidence for Potassium Depletion and Calcium Enrichment,
W73-11840 7B

CONSERVATION
The Coastal Challenge,
W73-11810 2L

CONSTITUTIONAL LAW
An Act Proposing an Amendment to Article IV, Section 93, as Amended, of the Constitution of Alabama Relative to Providing Irrigation and Water Conservation in the State.
W73-11963 6E

Sabine River Authority.
W73-11975 6E

CONSTRUCTION METHODS
New Continuous-Flow Process for Blast-Hole Drilling in Hydraulic-Engineering, Reclamation, and Water-Resources Construction,
W73-11733 8H

CONSTRUCTION SITES
Environmental Health (Construction Site Regulations).
W73-11985 6E

CONTAMINANTS
The Sparking of Lightning Arresters Due to Conductive Contaminants,
W73-11722 8C

CONTINENTAL SHELF
Phosphate in Sediments Off South-Western Africa,
W73-11811 2J

Marine Sanctuaries in California.
W73-11973 6E

Chemical Variations in Sedimentary Facies of an Inner Continental Shelf Environment, Northern Gulf of Mexico,
W73-12299 2J

CONTINENTS
Water Balance of World Continents and Balance Estimate of World Freshwater Resources (Vodnyy balans materikov zemnogo shara i balansovaya otsenka mirovykh resursov presnykh vod),
W73-12054 2A

CONTRACT ADMINISTRATION
An Approach to Underground Construction,
W73-11744 8A

CONTROL
The Dynamics and Control of Eulerian Turbomachines,
W73-11731 8C

CONTROL SYSTEMS
Metropolitan Water Intelligence Systems - Completion Report, Phase II,
W73-11704 5G

COOLING TOWERS
Cooling Towers and Water Quality,
W73-12155 5C

COORDINATION
Consensus: The First Step,
W73-12234 6F

COPPER
A Rotating Ring-Hemispherical Electrode for Electroanalytical Applications,
W73-12096 5A

CORBICULA-SANDAI
On the Water Quality of Lake Biwa-Ko and the Inhabitability of the Bivalve, Corbicula Sandai, In the Seta River, (In Japanese),
W73-12344 5C

CORES
Geotechnical Properties of Ocean Sediments Recovered with Giant Piston Corer: 1. Gulf of Maine,
W73-12085 2J

CORN (FIELD)
Soil Moisture Extraction and Irrigation Design Requirements for Corn,
W73-11727 3F

CORN-M
Effects of Irrigation and Fertilization on Yields and Chemical Composition of Corn and on the Changes in the Available K Contents of a Cecil Soil,
W73-12343 3F

CORROSION
Application of Cathodic Protection,
W73-11736 8G

Preventing Filamentous Scale in Well Water,
W73-12188 5F

CORROSION CONTROL
Application of Cathodic Protection,
W73-11736 8G

COST SAVINGS
An Approach to Underground Construction,
W73-11744 8A

COSTA RICA
Observations on Paramecium Occupying Arboreal Standing Water in Costa Rica,
W73-12340 2I

COSTS
An Approach to Underground Construction,
W73-11744 8A

Automatic Meter Reading Using Existing Telephone Circuits,
W73-12145 5A

COUNTERCURRENT ION EXCHANGE
Continuous Ion Exchange Softening,
W73-12189 5F

CRACK CONTROL
Control of Cracking in Concrete Structures,

W73-11760 3A

Reverse Osmosis Studies of Cellulose and Amylose Acetates,
W73-11761 3A

Apparatus for the Separation of Ions from Solution,
W73-11871 3A

Multi-Stage Flash Evaporator for Distilling Brines,
W73-11877 3A

Water Purification,
W73-11896 5F

Geothermal Resources as a Source of Water Supply,
W73-12333 3A

DESALINATION APPARATUS
Poly (N-Amido)Imides as Semipermeable Membranes,
W73-12036 3A

DESALINATION PROCESS
The Alumina-Lime Soda Water Treatment Process,
W73-11748 3A

DESALINATION PROCESSES
Desalting in the Arid Regions,
W73-12244 3A

DESERT ('DOWNS')
'Desert' Becomes 'Downs:' The Impact of a Scientific Discovery,
W73-12047 4A

DESERT PLANTS
Patterns of Water Movement in Trees and Shrubs,
W73-12246 2I

DESERTS
Groundwater Recharge Through the Zone of Aeration in a Sandy Desert (Pitaniye gruntovykh vod peschanoy pustyni cherz zonu aeratsii),
W73-12061 2F

Impact of Wetting on Microbial Respiration in Desert Soil,
W73-12257 2G

DESIGN
Bayesian Estimation and Design of Experiments for Growth Rates, With Applications to Measuring Water Quality,
W73-12270 5A

DESIGN CRITERIA
Three-Dimensional Behavior of a Central Core Dam,
W73-11822 8A

DESIGN DATA
A Submersible Spectroradiometer and Data Acquisition System,
W73-12135 5A

DESILTING
Disposition of Spoil on the Dump Site,
W73-12318 5E

Sediments of the Dredging and Disposal Areas,
W73-12319 5E

Characteristics of the Physical Environment,
W73-12320 5E

DETERGENTS
The Problem of Phosphorus in New York's Waters.
W73-12012 5G

DETRITUS
Distribution of Organics from Salmon Decomposition,
W73-11887 5B

DEVIL'S ISLAND REACH (MISSISSIPPI RIVER)
Channel Conditions, Devil's Island Reach, Mississippi River, Missouri and Illinois,
W73-11821 8B

DEW
Dew on Wheat,
W73-12182 3F

DIALYSIS
Ionic Block Copolymers as Piezodialysis Membranes,
W73-11757 3A

DIATOMS
Silicon and the Ecology of Marine Plankton Diatoms. II. Silicate-Uptake Kinetics in Five Diatom Species,
W73-11863 5B

Plankton Diatom Species Biomasses and the Quality of American Rivers and the Great Lakes,
W73-11942 5C

The Effects of Ammonium and Phosphate Enrichments on Chlorophyll A, Pigment Ratio and Species Composition of Phytoplankton of Vineyard Sound,
W73-12116 5C

DICTYOTA DICHOTOMA
Correlated Light and Electron Microscope Studies on Brown Algae. I. Localization of Alginic Acid and Sulphated Polysaccharides in Dictyota,
W73-11939 5C

DIELDRIN
Accumulation of Dieldrin in an Alga (Scenedesmus Obliquus), Daphnia Magna and the Guppy (Poecilia Reticulata),
W73-12098 5B

DIFFUSION
Diffusion of Sodium Chloride in Cellulose and Amylose Acetates,
W73-11758 3A

Water Diffusion through Cellulose and Amylose Acetates,
W73-11759 3A

DIGESTIBILITY
Feedlot Waste Utilized Efficiently by Animals.
W73-11762 5B

DIGITAL COMPUTERS
Digital Telemetry--Functional Description and Specifications,
W73-11815 7B

DIGITAL TELEMETRY
Digital Telemetry--Functional Description and Specifications,
W73-11815 7B

DIGITAL TO ANALOG CONVERTERS
A-D and D-A Converters for High Speed Data Acquisition Applications,
W73-12141 5A

A Unified Method for the Reconstruction of Sampled Data,
W73-12147 5A

DIMENSIONS
Determining the Best Sizes of the Open Cut Canals Used in Hydroameliorations,
W73-11870 6A

DIPTERA
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

The Light Threshold Controlling the Vertical Migration of Chaoborus Punctipennis in a Georgia Impoundment,
W73-11943 5C

DISCHARGE MEASUREMENT
Measurements of Currents,
W73-11850 2E

DISCHARGE (WATER)
On The Ground-Water Discharge to the Baltic Sea and Methods for Estimating It,
W73-11843 2F

Studies of Cation Budgets in the Southern Appalachians on Four Experimental Watersheds with Contrasting Vegetation,
W73-11860 2E

Patterns of Stream-Discharge Variability (Zakonomernosti v izmenenii modulya stoka),
W73-12056 2E

DISINFECTION
Waste Water Treatment System,
W73-11878 5D

DISPERSE SYSTEMS
Bound Water In Disperse Systems (Svyazannaya voda v dispersnykh sistemakh).
W73-11857 1A

DISPERSION
Bound Water In Disperse Systems (Svyazannaya voda v dispersnykh sistemakh).
W73-11857 1A

DISPOSAL
Survey of Industrial Waste Injection Wells: Volume I,
W73-12051 5E

DISSOLVED AMINO ACIDS
Kinetics of the Nonbiological Decomposition and Racemization of Amino Acids in Natural Waters,
W73-11938 2K

DISSOLVED ORGANIC MATTER
Decomposition of Dissolved Organic Carbon and Nitrogen Compounds from Leaves in an Experimental Hardwater Stream,
W73-11962 5C

DISSOLVED OXYGEN
Method and Apparatus for Determining Oxygen Consumption Rate in Sewage,
W73-11883 5D

Studies on Factors Affecting Survival of Nile Fish in the Sudan. III. The Effect of Oxygen,
W73-12133 5C

Distribution of the Cladoceran Podon Polyphemoides in the Chesapeake Bay,
W73-12152 5A

Aquatic Plant Control and Eradication Program, State of Texas (Final Environmental Statement).
W73-12203 4A

DISTILLATION
Multi-Stage Flash Evaporator for Distilling Brines,
W73-11877 3A

DISTILLED WATER
Morphological, Biochemical, and Growth Characteristics of Pseudomonas cepacia from Distilled Water,
W73-12103 5A

DISTRIBUTION
Occurrence, Distribution and Density of Rangia Cuneata in Lakes Pontchartrain and Maurepas, Louisiana,
W73-11957 5C

DISTRIBUTION PATTERNS
Distribution of the Cladoceran Podon Polyphemoides in the Chesapeake Bay,
W73-12152 5A

DISTRIBUTION (PUPFISH)
Interspecific Interactions and Limiting Factors of Abundance and Distribution in the Red River Pupfish, Cyprinodon rubrofluviatilis,
W73-12181 2I

DIVERSION
Effect of Diversion of Domestic Waste Waters on Phosphorus Content and Eutrophication of the Madison Lakes,
W73-11946 5C

DNA
Deoxyribonucleic Acid Base Composition and Taxonomic Position of Glucose Fermenting Marine Bacteria of the Genus Vibrio and Related Genera, (Composition en Bases de L'Adn et Position Taxonomique de Bacteries Marines Fermentant le Glucose, du Genre Vibrio et des Genres Voisins),
W73-12090 5A

DNA REPLICATION
Isolation and Characterization of Thermosensitive Escherichia coli Mutants Defective in Deoxyribonucleic Acid Replication,
W73-12110 5A

DNIESTER RIVER
A Precipitation-Based Forecast of Great Storm Floods on Mountain Tributaries of the Dniester (Prognoz vysokikh dozhdevykh pavodkov gornykh pritokov Dnestra po osadkam),
W73-11829 6B

DOCUMENTATION
Environmental Law Abstracts, Volume II,
W73-11998 10C

DOMESTIC WASTES
Nitrogen Removal from Waste Water by Breakpoint Chlorination,
W73-11890 5D

Method and Apparatus for Ecological Recycling of Waste Products to Produce Fertilizer and Garden Plant Nutrients,
W73-11895 5D

Domestic Sewage Treatment Plant,
W73-11897 5D

DOUBLE-CURVATURE ARCH DAMS
The Hendrik Verwoerd Dam of the Orange River Project, South Africa.
W73-11740 8A

DOUBLE SAMPLING
On Double Sampling for Stratification and Analytical Surveys,
W73-12092 5A

DRAINAGE
Drainage under State Laws (Minnesota and Arkansas).
W73-11966 6E

McMullen V. Ramsey Stock Farms, Inc. (Landowners Right to Drain Bottomlands or Non-Navigable Lake).
W73-12001 6E

Drainage Law in North Dakota: An Overview,
W73-12215 6E

DRAINAGE BASINS
Fish Species Diversity in Relation to Stream Order and Physicochemical Conditions in the Plum Creek Drainage Basin,
W73-12167 2I

DRAINAGE DISTRICTS
Interstate Drainage Districts.
W73-11981 6E

Union Drainage Dist. No. 1 V. Special Drainage Dist. (Action by Drainage District to Impose Liability on Adjoining Drainage Districts to Bear Share of Cost of Clean-Out Work on Ditches in the District).
W73-12208 6E

Drainage Law in North Dakota: An Overview,
W73-12215 6E

Drainage Maintenance and Repair Districts.
W73-12222 6E

DRAINAGE PRACTICES
Drainage Law in North Dakota: An Overview,
W73-12215 6E

DRAINAGE PROGRAMS
Union Drainage Dist. No. 1 V. Special Drainage Dist. (Action by Drainage District to Impose Liability on Adjoining Drainage Districts to Bear Share of Cost of Clean-Out Work on Ditches in the District).
W73-12208 6E

Drainage Maintenance and Repair Districts.
W73-12222 6E

DRAINAGE RIGHTS
Individual Drainage Rights.
W73-12229 6E

DRAINAGE SYSTEMS
Interstate Drainage Districts.
W73-11981 6E

A Master Planning Methodology for Urban Drainage,
W73-12006 4A

Engineering Report on Mason Street and Milbank Avenue Drainage and Drainage Systems, Greenwich, Connecticut.
W73-12011 8A

Individual Drainage Rights.
W73-12229 6E

DREDGING
Little River Inlet North Carolina and South Carolina--Navigation (Final Environmental Impact Statement).
W73-12202 4A

Disposition of Spoil on the Dump Site,
W73-12318 5E

Sediments of the Dredging and Disposal Areas,
W73-12319 5E

Characteristics of the Physical Environment,
W73-12320 5E

DROUGHT RESISTANCE
Drought Effects on a Semidesert Grassland Range,
W73-12247 2I

DROUGHT TOLERANCE
Water-Stress Patterns in Honey Mesquite,
W73-12252 2I

DUCKWEED
Use of Duckweed for Water Treatment and Animal Feed,
W73-11769 5D

DYE RELEASES
Tests of Rhodamine WT Dye for Toxicity to Oysters and Fish,
W73-12068 5C

DYES
An Evaluation of Selected Marks and Tags for Marking Recently Metamorphosed Sea Lampreys,
W73-12251 2H

E. COLI
Resistance to Coliphage Infection Induced in Escherichia coli by Growth in the Presence of a Surfactant,
W73-12105 5C

Discrepancies in the Enumeration of Escherichia coli,
W73-12107 5A

Isolation and Characterization of Thermosensitive Escherichia coli Mutants Defective in Deoxyribonucleic Acid Replication,
W73-12110 5A

EASEMENTS
Oil and Gas--Rights of Mineral Lessee in Use of Surface Owner's Fresh Water for Secondary Recovery Purposes, Sun Oil V. Whitaker.
W73-12212 6E

ECOLOGICAL DISTRIBUTION
Abundance and Diversity of Mollusca in an Industrialized Portion of the Ottawa River Near Ottawa-Hull, Canada,
W73-11862 5C

ECOLOGY
Management Science, Economics and Environmental Science,
W73-11867 6A

Vibrio Parahaemolyticus-Isolation, Identification, Classification, and Ecology,
W73-12144 5A

ECONOMICS
Management Science, Economics and Environmental Science,
W73-11867 6A

W73-12273 6A

ECOSYSTEMS
An Interactive Analysis of Natural Resource Allocation in a Contemporary Estuarine Ecosystem,
W73-11710 6B

Chemostasis and Homeostasis in Aquatic Ecosystems: Principles of Water Pollution Control,
W73-11935 5C

Modules for Integrated Aquatic Modeling,
W73-12325 5B

EDUCATION
Research in the Development and Utilization of Atmospheric Water Resources in Montana,
W73-11712 3B

Measurements of Currents,
W73-11850 2E

EFFLUENT
Radiological Status of the Groundwater Beneath the Hanford Project - July-December, 1971,
W73-11923 5A

EFFLUENT LIMITATIONS
The Federal Water Pollution Control Act Amendments of 1972: Effective Controls at Last,
W73-12214 5G

EFFLUENTS
Final Environmental Statement Related to Operation of Maine Yankee Atomic Power Station.
W73-11899 5C

Final Environmental Statement Related to Operation of Zion Nuclear Power Station Units 1 and 2.
W73-11900 5C

Final Environmental Statement Related to Operation of Surry Power Station Unit 2.
W73-11903 5C

Final Environmental Statement Related to Operation of Kewaunee Nuclear Power Plant.
W73-11904 5C

Report on Releases of Radioactivity in Effluents from Nuclear Power Plants for 1971.
W73-11905 5B

Final Environmental Statement Related to Operation of Fort Calhoun Station Unit 1.
W73-11906 5C

Environmental Monitoring in the Vicinity of the Los Alamos Scientific Laboratory - Calendar Year 1972.
W73-11909 5A

Final Environmental Statement Related to the Arkansas Nuclear One Unit 1.
W73-11913 5C

Final Environmental Statement Related to the Proposed Hanford Number Two Nuclear Power Plant.
W73-11917 5C

The Potential Radiological Implications of Nuclear Facilities in the Upper Mississippi River Basin in the Year 2000.
W73-11918 5B

Final Environmental Statement Related to Construction of Davis-Besse Nuclear Power Station.
W73-11920 5C

Final Environmental Statement Related to Construction of Shearon Harris Nuclear Power Plant Units 1, 2, 3, and 4.
W73-11926 5C

Final Environmental Statement Related to the Proposed Crystal River Unit 3.
W73-11927 5C

Final Environmental Statement Related to Operation of Pilgrim Nuclear Power Station.
W73-11928 5C

Final Environmental Statement Related to Construction of Joseph M. Farley Nuclear Plant Units 1 and 2.
W73-11931 5C

Final Environmental Statement Related to Operation of Vermont Yankee Nuclear Power Station.
W73-11932 5C

Environmental Statement, Rio Blanco Gas Stimulation Project, Rio Blanco County, Colorado.
W73-12258 5A

Radionuclides in River Systems,
W73-12259 5B

ELECTRIC POWERPLANTS
Remote Sensing Study of Thermal Discharges to Lake Michigan, Wisconsin, Illionois, Indiana, and Michigan.
W73-12309 5B

ELECTRICAL PROPERTIES
Heterogeneous-Site Glass Membrane Potentials-A Solid-State Approach,
W73-12102 5A

ELECTROCHEMISTRY
Titration of Sulphate in Mineral Waters and Sea Water by Using the Solid-State Lead Electrode,
W73-11818 2K

A Rotating Ring-Hemispherical Electrode for Electroanalytical Applications,

GLOBAL HYDROLOGY
Water Balance of World Continents and Balance Estimate of World Freshwater Resources (Vodnyy balans materikov zemnogo shara i balansovaya otsenka mirovykh resursov presnykh vod),
W73-12054 2A

GLUCOSE
The Kinetics of Simultaneous Glucose and Xylose Utilization by Rhodotorula Rubra,
W73-11934 5C

GONADOTROPIN SPERMATOZOA
Fertilization of Pink Salmon (Oncorhynchus gorbuscha) Ova by Spermatozoa from Gonadotropin- injected Juveniles,
W73-11866 8I

GOVERNMENTAL INTERRELATIONS
Drainage under State Laws (Minnesota and Arkansas).
W73-11966 6E

Kansas-Nebraska Big Blue River Compact.
W73-11972 6E

Interstate Drainage Districts.
W73-11981 6E

GOVERNORS
Optimal Gate Closure Schedule for Hydroelectric Turbine System,
W73-11742 8C

GRADIENTS (STREAMS)
Stream-Profile Analysis and Stream-Gradient Index,
W73-12064 2J

GRAM-NEGATIVE BACTERIA
Carbon Source Utilization Tests as an Aid to the Classification of Non-Fermenting Gram-Negative Bacteria,
W73-12140 5A

GRASSLANDS
Drought Effects on a Semidesert Grassland Range,
W73-12247 2I

Nutrient Availability in Desert Grassland Soils Under Mesquite (Prosopis juliflora) Trees and Adjacent Open Areas,
W73-12250 2I

GRAVELS
Major Aquifers and Sand and Gravel Resources in Day County, South Dakota,
W73-11847 2F

GRAVITY
Submerged Filter-Horizontal Flow Mode,
W73-11885 5D

GRAVITY STUDIES
Gravity and Shallow-Ice Temperature Measurements on the Rusty Glacier,
W73-11800 2C

GRAY COUNTY (TEX)
Ground-Water Resources of Wheeler and Eastern Gray Counties, Texas,
W73-12032 2F

GREAT LAKES
Systems Analysis of the Great Lakes,
W73-11703 4A

Preserving the Great Lakes,
W73-11955 5B

Great Lakes River Basins Commission.
W73-11984 6E

An Evaluation of Selected Marks and Tags for Marking Recently Metamorphosed Sea Lampreys,
W73-12251 2H

Great Lakes Water Levels, 1970, Daily and Monthly Average Water Surface Elevations.
W73-12298 7C

GREAT MARSH (DEL)
The Great Marsh, Lewes, Delaware--The Physiography, Classification and Geologic History of a Coastal Marsh,
W73-12033 2L

GREENWICH (CONN)
Engineering Report on Mason Street and Milbank Avenue Drainage and Drainage Systems, Greenwich, Connecticut.
W73-12011 8A

GRIZZLY GLACIER (YUKON)
Comparison of Moraines Formed by Surging and Normal Glaciers,
W73-11793 2C

GROUNDWATER
On The Ground-Water Discharge to the Baltic Sea and Methods for Estimating It,
W73-11843 2F

Hydrologic Data: 1971, Volume V: Southern California.
W73-11846 2E

Simulation of Hydrologic and Chemical-Quality Variations in an Irrigated Stream-Aquifer System--A Preliminary Report,
W73-12024 2A

Potential for Ground Water Pollution from the Land Disposal of Solid Wastes,
W73-12025 5B

Preventing Filamentous Scale in Well Water,
W73-12188 5F

Reduction of Uncertainties in Autocorrelation by the Use of Physical Models,
W73-12283 2A

The Evaluation and Application of C-14 Dating of Groundwater,
W73-12297 2F

Water for Alabama--Identification of Objectives,
W73-12315 6B

GROUNDWATER BASINS
Judicial-Oriented Institutional Solutions: San Gabriel Valley Experience,
W73-12009 4B

GROUNDWATER MINING
Utilization of Ground Water Resources.
W73-11971 6E

GROUNDWATER MOVEMENT
Isotope Methods in Groundwater Science (Isotopenmethoden in Der Grundwasserkunde),
W73-11929 2F

Ozark Industries, Inc. V. Stubbs Transports, Inc. (Action to Recover Fishkill Damages when Gasoline from Overturned Truck Found its Way into Springfed Trout Pool).
W73-12197 6E

Physical Assumptions and Their Consequences on Modelling Groundwater Movement,
W73-12288 4B

The Evaluation and Application of C-14 Dating of Groundwater,
W73-12297 2F

GROUNDWATER RECHARGE
Studies of Saprolite and Its Relation to the Migration and Occurrence of Groundwater in Crystalline Rocks,
W73-11706 2G

Orange County Water District's Water Factory 21,
W73-11719 5D

Groundwater Recharge Through the Zone of Aeration in a Sandy Desert (Pitaniye gruntovykh vod peschanoy pustyni cherz zonu aeratsii),
W73-12061 2F

GROUNDWATER RESOURCES
Major Aquifers and Sand and Gravel Resources in Day County, South Dakota,
W73-11847 2F

Utilization of Ground Water Resources.
W73-11971 6E

Greater Baton Rouge Water Conservation District.
W73-11996 6E

Extent of Development and Hydrologic Conditions of the Alluvial Aquifer, Fountain and Jimmy Camp Valleys, Colorado, 1972,
W73-12023 2F

Hydrologic Reconnaissance of Pilot Valley, Utah and Nevada,
W73-12029 2F

Ground-Water Resources of Rains and Van Zandt Counties, Texas,
W73-12031 2F

Ground-Water Resources of Wheeler and Eastern Gray Counties, Texas,

Effect of Zinc on Growth and Development of Larvae of the Pacific Oyster Crassostrea gigas,
W73-12118 5C

Silicon and the Ecology of Marine Plankton Diatoms. I. Thalassiosira pseudonana (Cyclotella nana) Grown in a Chemostat with Silicate as Limiting Nutrient,
W73-12119 5C

Bayesian Estimation and Design of Experiments for Growth Rates, With Applications to Measuring Water Quality,
W73-12270 5A

GULF COASTAL PLAIN
Hydrologic Significance of Lithofacies of the Cane River Formation or Equivalents of Arkansas, Louisiana, Mississippi, and Texas,
W73-12053 2F

GULF OF ALASKA
Coarse-Grained Sedimentation on a Braided Outwash Fan, Northeast Gulf of Alaska,
W73-12307 2L

GULF OF CADIZ
Bed Forms of the Mediterranean Undercurrent Observed With Side-Scan Sonar,
W73-12300 2L

GULF OF MAINE
Geotechnical Properties of Ocean Sediments Recovered with Giant Piston Corer: 1. Gulf of Maine,
W73-12085 2J

GULF OF MEXICO
A Field Investigation of Rollover Fish Pass, Bolivar Penninsula, Texas,
W73-11854 8B

Chemical Variations in Sedimentary Facies of an Inner Continental Shelf Environment, Northern Gulf of Mexico,
W73-12299 2J

Environmental Guide for the U.S. Gulf Coast,
W73-12310 6G

HALOSPHAERIA MEDIOSETIGERA
Role of Marine Fungi in the Biochemistry of the Oceans. V. Patterns of Constitutive Nutritional Growth Responses,
W73-12154 5A

HANFORD SITE
Environmental Surveillance at Hanford for CY-1972,
W73-11924 5A

HARBORS
Shoaling Conditions, St. Louis Harbor, Mississippi River,
W73-11856 8B

Deep Draft Harbor and Terminal Authority.
W73-11994 6E

Environmental Guide for the U.S. Gulf Coast,
W73-12310 6G

HARDPAN
Studies of Saprolite and Its Relation to the Migration and Occurrence of Groundwater in Crystalline Rocks,
W73-11706 2G

HARRIS LAKE (NY)
Hypsometric Map of Harris Lake, New York,
W73-12328 2H

HATCHERY REARING
Hatchery Rearing of Walleyes Using Artificial Food,
W73-12231 8I

HAWAII
The Quality of Coastal Waters: First Annual Progress Report,
W73-12295 5B

HEAD LOSS
Resistance Losses in Noncircular Flood Control Conduits and Sluices,
W73-12027 8B

Hydraulic Network Analysis Using Linear Theory,
W73-12041 7C

HEAT BALANCE
Thermal Regime of Freezing Bodies of Water (Termika zamerzayushchikh vodoyemov),
W73-11858 2C

HEAT BUDGET
Eddy Correlation Measurements of Evaporation and Sensible Heat Flux Over Arctic Sea Ice,
W73-12083 2D

HEAT EXCHANGERS
Scale Inhibition by Organic Electrodeposition,
W73-11751 8G

HEAT FLOW
Thermal Drilling and Ice-Temperature Measurements in the Rusty Glacier,
W73-11801 2C

Thermal Regime of Freezing Bodies of Water (Termika zamerzayushchikh vodoyemov),
W73-11858 2C

Eddy Correlation Measurements of Evaporation and Sensible Heat Flux Over Arctic Sea Ice,
W73-12083 2D

HEATS OF FUSION
Differential Scanning Calorimetry of Cellulose Acetate,
W73-11755 3A

HEAVY METALS
Distribution of Mercury, Cadmium, Lead and Thallium in a Eutrophic Lake,
W73-11707 5B

The Toxicity of Heavy Metals to Embryos of the American Oyster Crassostrea virginica,
W73-12113 5C

HELMINTH PARASITES
Population Biology of the Helminth Parasites of Phoxinus Phoxinus (L.) The Minnow, in a Cardiganshire Lake,
W73-11716 2H

HEMIPTERA
Diversity and Abundance of Aquatic Insects Reduced by Introduction of the Fish Clarias gariepinus to Pools in Central Africa,
W73-12339 2H

HENDRIK VERWOERD DAM (SOUTH AFRICA)
The Hendrik Verwoerd Dam of the Orange River Project, South Africa.
W73-11740 8A

HERBICIDES
Aquatic Plant Control and Eradication Program, State of Texas (Final Environmental Statement).
W73-12203 4A

Reactions of Herbicides with Soil and Plants,
W73-12266 5B

HEXACYANOFERRATE
A Polythene Graphite Electrode for Voltammetry,
W73-12097 5A

HIGH TEMPERATURE
Conditions for Instability in Restrained Concrete Panels Exposed to Fire,
W73-11739 8F

HIGHWAY BRIDGES
Deflections of Prestressed Concrete Bridges in Japan,
W73-11735 8F

HIRUDINEA
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

HISTORY
A Case Study in Interstate Resource Management: The California-Nevada Water Controversy, 1865-1955,
W73-11705 6B

HOGS
Waste-Caused Air Pollutants are Measured in Swine Buildings,
W73-11778 5A

HOMEOSTASIS
Chemostasis and Homeostasis in Aquatic Ecosystems: Principles of Water Pollution Control,
W73-11935 5C

HORSE RANGE SWAMP WATERSHED (S.C.)
Horse Range Swamp Watershed Project, Orangeburg County, South Carolina (Final Environmental Impact Statement).
W73-12201 4D

HUMICOLA ALOPALLONELLA
Role of Marine Fungi in the Biochemistry of the Oceans. V. Patterns of Constitutive Nutritional Growth Responses,
W73-12154 5A

HUMIFICATION
The Transformation of Nitrogen and Carbon in the Soil During Humification of Straw Labelled with N15,
W73-12342 2G

HYDRAULIC CONDUCTIVITY
Variability of the Soil Water Flow Parameters and Their Effect on the Computation of Rainfall Excess and Runoff,
W73-12291 2G

HYDRAULIC CONDUCTIVITY (SOILS)
Effect of Exchangeable Sodium on Hydraulic Conductivity of Soil,
W73-11849 2G

HYDRAULIC MACHINERY
The Dynamics and Control of Eulerian Turbomachines,
W73-11731 8C

HYDRAULIC SYSTEMS
Hydraulic Network Analysis Using Linear Theory,
W73-12041 7C

HYDRAULIC TURBINES
Sonic Cavitation Studies on Model and Prototype Water Turbines,
W73-11720 8C

The Dynamics and Control of Eulerian Turbomachines,
W73-11731 8C

Optimal Gate Closure Schedule for Hydroelectric Turbine System,
W73-11742 8C

HYDRAULICS
A Field Investigation of Rollover Fish Pass, Bolivar Penninsula, Texas,
W73-11854 8B

Determining the Best Sizes of the Open Cut Canals Used in Hydroameliorations,
W73-11870 6A

HYDRO-ELECTRIC POWERPLANTS
Some Conservational Problems Posed by Hydroelectric Power Installations in Alberta,
W73-12268 5C

HYDROAMELIORATIONS
Determining the Best Sizes of the Open Cut Canals Used in Hydroameliorations,
W73-11870 6A

HYDRODYNAMICS
Hydrogynamic Flux Control for Waste Water Application of Hyperfiltration Systems,
W73-11713 5D

HYDROELECTRIC POWER
Report of Hydroelectric Subproject,
W73-11888 6B

HYDROELECTRIC POWERPLANTS
The Revin Pumped-Storage Plant,
W73-11726 8C

HYDROGEN ION CONCENTRATION
Heterogeneous-Site Glass Membrane Potentials-A Solid-State Approach,
W73-12102 5A

Studies on Factors Affecting Survival of Nile Fish in the Sudan. I. The Effect of Hydrogen Ion Concentration,
W73-12131 5C

HYDROGEOLOGY
Isotope Methods in Groundwater Science (Isotopenmethoden in Der Grundwasserkunde),
W73-11929 2F

Extent of Development and Hydrologic Conditions of the Alluvial Aquifer, Fountain and Jimmy Camp Valleys, Colorado, 1972,
W73-12023 2F

Hydrologic Reconnaissance of Pilot Valley, Utah and Nevada,
W73-12029 2F

Ground-Water Resources of Rains and Van Zandt Counties, Texas,
W73-12031 2F

Ground-Water Resources of Wheeler and Eastern Gray Counties, Texas,
W73-12032 2F

Hydrologic Significance of Lithofacies of the Cane River Formation or Equivalents of Arkansas, Louisiana, Mississippi, and Texas,
W73-12053 2F

Hydrogeologic Characteristics of the Valley-Fill Aquifer in the Julesburg Reach of the South Platte River Valley, Colorado,
W73-12296 2F

The Environmental Impact of Ground Water use on Cape Cod--Impact Study No. 3,
W73-12303 5B

HYDROLOGIC BUDGET
Water-Budget Studies of Lower Mesilla Valley and El Paso Valley, El Paso County, Texas.,
W73-12022 2A

HYDROLOGIC DATA
Digital Telemetry--Functional Description and Specifications,
W73-11815 7B

Hydrologic Data: 1971, Volume V: Southern California.
W73-11846 2E

Simulation of Hydrologic and Chemical-Quality Variations in an Irrigated Stream-Aquifer System--A Preliminary Report,
W73-12024 2A

Hydrologic Reconnaissance of Pilot Valley, Utah and Nevada,
W73-12029 2F

Annual Compilation and Analysis of Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1971,
W73-12038 2E

Water Resources Data in Alabama,
W73-12074 6A

Evaluation of Seasonal Time-Series Models: Applications to Mid-West River Flow Data,
W73-12272 7C

Effect of Length of Records of Monthly Flows on the First Serial Correlation Coefficient,
W73-12285 2E

Hydrogeologic Characteristics of the Valley-Fill Aquifer in the Julesburg Reach of the South Platte River Valley, Colorado,
W73-12296 2F

HYDROLOGIC DATA (SOUTHERN CALIF)
Hydrologic Data: 1971, Volume V: Southern California.
W73-11846 2E

HYDROLOGY
Studies of Cation Budgets in the Southern Appalachians on Four Experimental Watersheds with Contrasting Vegetation,
W73-11860 2E

Hydrology of the Pacific Ocean (Gidrologiya Tikhogo okeana).
W73-12063 2L

Streamflow Frequency Using Stochastically Generated Hourly Rainfall,
W73-12284 2E

Uncertainties in Point and Areal Sampling of Precipitation and Their importance in Hydrologic Computations,
W73-12290 2B

Space-Time Uncertainties in Precipitation Measurement,
W73-12293 2B

The Evaluation and Application of C-14 Dating of Groundwater,
W73-12297 2F

HYDROLYSIS
Angular Dependence of Substituent Effects in Rigid, Bicyclic Systems,
W73-12305 2K

HYPOLIMNION
Studies on Freshwater Micro-Organisms: Phosphatase Activity in Lakes of Differing Degrees of Eutrophication,
W73-12089 5C

HYPOTHESIS TESTING
Bayesian Acceptance-Sampling Schemes for Two-Sided Tests of the Mean of a Normal Distribution of Known Variance,
W73-12101 5A

Some Exact Tests of Hypotheses About Grubbs's Estimators,
W73-12112 5A

HYPSOMETRIC ANALYSIS
Hypsometry of Lower Chateaugay Lake and a Pond on the Saranac River,
W73-12327 2H

Hypsometric Map of Harris Lake, New York,
W73-12328 2H

HYSTERESIS
Monomolecular Film Properties of Cellulose and Amylose Triacetates at the Air-Water Interface,
W73-11756 3A

ICE
Freezing Process Studies: Butane Stripping in Sprays and Evaporation of Butane Drops,
W73-11752 3A

Seasonal Regime and Hydrological Significance of Stream Icings in Central Alaska,
W73-12314 2C

ICE COVER
Absorption of Solar Radiation by Melting Ice Cover on Rivers and Reservoirs (K voprosu o pogloshchenii solnechnoy radiatsii tayushchim ledyanym pokrovom rek i vodokhranilishch),
W73-12058 2C

Microwave Signatures of First-Year and Multiyear Sea Ice,
W73-12081 7B

ICE CRYSTALLIZATION
Ice Crystallization Studies in Freeze Desalinators,
W73-11750 3A

ICEFIELD RANGES (CANADA)
Steele Glacier, 1935-1968,
W73-11791 2C

Movement Observations on the Terminus Area of the Steele Glacier, July 1967,
W73-11792 2C

Observations of the Surge of Steele Glacier,
W73-11796 2C

Snow Accumulation in the Icefield Ranges, St. Elias Mountains,
W73-11803 2C

ICINGS
Seasonal Regime and Hydrological Significance of Stream Icings in Central Alaska,
W73-12314 2C

IDAHO
Habitat Selection and Spatial Interaction by Juvenile Chinook Salmon and Steelhead Trout in Two Idaho Streams,
W73-12245 2I

ILLINOIS
Withdrawal of Water by Industry in Illinois, 1970-1971,

W73-11980 6E

IRRIGATION PROJECTS
US-USSR Expertise Exchange,
W73-12255 6E

IRRIGATION REQUIREMENTS
Determining Irrigation Potential - A Computer Model,
W73-11734 3F

IRRIGATION SYSTEMS
Side Roll Sprinklers,
W73-11737 3F

IRRIGATION WATER
Water Reuse, A Bibliography, Volume 1.
W73-11701 5D

Ground-Water Resources of the Mora River Drainage Basin, Western Mora County, New Mexico,
W73-12035 2F

ISOLATION
Morphological, Biochemical, and Growth Characteristics of Pseudomonas cepacia from Distilled Water,
W73-12103 5A

Isolation and Characterization of Thermosensitive Escherichia coli Mutants Defective in Deoxyribonucleic Acid Replication,
W73-12110 5A

Isolation of New Methanol-Utilizing Bacteria and its Thiamine-Requirement for Growth,
W73-12122 5A

Vibrio Parahaemolyticus-Isolation, Identification, Classification, and Ecology,
W73-12144 5A

ISOTOPE STUDIES
An Investigation of Tritium Decontamination,
W73-11925 5D

ISOTOPIC COMPOSITION (WATER)
Isotopic Compostion of Waters of the Broadlands Geothermal Field,
W73-12349 2K

ISRAEL
Effect of Water Stress and High Temperature on Nitrate Reduction in Citrus Leaves,
W73-12330 3F

'JACKKNIFE' METHOD
Methods for Assessing Variability, With Emphasis on Simulation Data Interpretations,
W73-12274 7C

JAPAN (LAKE BIWA-KO)
On the Water Quality of Lake Biwa-Ko and the Inhabitability of the Bivalve, Corbicula Sandai, In the Seta River, (In Japanese),
W73-12344 5C

JUDICIAL DECISIONS
Brickell V. Trammell (Title Suit to Determine Ownership of Submerged Lands Along Navigable Body of Water).
W73-11967 6E

Pollution Control Under the Pennsylvania Clean Streams Law,
W73-11976 6E

Richardson V. Schneider (Action Involving Dispute as to Ownership of Peninsula which Jutted Into Lake).
W73-12000 6E

Ozark Industries, Inc. V. Stubbs Transports, Inc. (Action to Recover Fishkill Damages when Gasoline from Overturned Truck Found its Way into Springfed Trout Pool).
W73-12197 6E

Union Drainage Dist. No. 1 V. Special Drainage Dist. (Action by Drainage District to Impose Liability on Adjoining Drainage Districts to Bear Share of Cost of Clean-Out Work on Ditches in the District).
W73-12208 6E

Citizens for Clean Air, Inc. V. Corps of Engineers, U.S. Army (Public Hearing Not Required Under the NEPA).
W73-12209 6E

Environmental Law--Expanding the Definition of Public Trust Uses,
W73-12211 6E

Save Our Ten Acres V. Kreger (Standard of Judicial Review of Agency Action Under Nepa).
W73-12218 6E

KANANASKIS RIVER (ALBERTA)
Some Conservational Problems Posed by Hydroelectric Power Installations in Alberta,
W73-12268 5C

KAPLAN TURBINES
Sonic Cavitation Studies on Model and Prototype Water Turbines,
W73-11720 8C

KARAKUM DESERT
Groundwater Recharge Through the Zone of Aeration in a Sandy Desert (Pitaniye gruntovykh vod peschanoy pustyni cherz zonu aeratsii),
W73-12061 2F

KASKAWULSH GLACIER (CANADA)
Supraglacial Streams of the Kaskawulsh Glacier,
W73-11805 2C

KEHOE LAKE
Kehoe Lake, Tygarts Creek, Kentucky (Final Environmental Statement).
W73-11999 6E

KENTUCKY
Kehoe Lake, Tygarts Creek, Kentucky (Final Environmental Statement).
W73-11999 6E

Precipitation Probabilities for Kentucky,
W73-12304 2B

KINETICS
Kinetics of Microbially Mediated Methylation of Mercury in Aerobic and Anaerobic Aquatic Environments,
W73-11711 5B

Silicon and the Ecology of Marine Plankton Diatoms. II. Silicate-Uptake Kinetics in Five Diatom Species,
W73-11863 5B

The Kinetics of Simultaneous Glucose and Xylose Utilization by Rhodotorula Rubra,
W73-11934 5C

Some Factors Influencing Kinetic Constants for Microbial Growth in Dilute Solution,
W73-11956 5C

The Use of Radioactive Isotopes to Measure the Transfer of Materials in Aquatic Food Chains,
W73-12153 5A

KLEBSIELLA
Effect of Acetate Upon the Formation of Acetoin in Klebsiella and Enterobacter and its Possible Practical Application in a Rapid Voges-Proskauer Test,
W73-12106 5A

Potential Pathogens in the Environment: Isolation, Enumeration, and Identification of Seven Genera of Intestinal Bacteria Associated with Small Green Pet Turtles,
W73-12150 5A

KOKANEE SALMON
Introduction of Kokanee Salmon (Oncorhynchusnerka) Into Lake Huron,
W73-11717 8I

LABORATORY TESTS
A Submersible Spectroradiometer and Data Acquisition System,
W73-12135 5A

On the Photodecomposition of Chlorophyll in Vitro,
W73-12146 5C

LABRADOR (CHURCHILL FALLS)
Studies of the Spray Zone of Churchill Falls, Labrador,
W73-12162 2I

LAC HERTEL (QUEBEC)
Net Plankton and Nanoplankton Production and Biomass in a North Temperate Zone Lake,
W73-11951 5C

LAKE BEDS
Burns V. Coastal Petroleum Company (Action to Determine Whether Bottom of Lake was Included within Oil and Mineral Lease).
W73-11968 6E

LAKE CHAMPLAIN
State University of New York, College at Plattsburgh, Lakes and Rivers Research Laboratory 1972 Technical Report.
W73-12321 5B

Studies on the Seasonal and Spatial Distribution of Phosphates, Nitrates, and Silicates in Lake Champlain,
W73-12323 5B

Orthophosphate Concentrations and Distributions in Northwest Bay: 1971-1972,
W73-12324 5B

Modules for Integrated Aquatic Modeling,
W73-12325 5B

A General Model for Vertical Thermal Stratification in Ice Free Lakes,
W73-12326 2H

LAKE HURON
Introduction of Kokanee Salmon (Oncorhynchusnerka) Into Lake Huron,
W73-11717 8I

LAKE LEVEL CONTROL
Systems Analysis of the Great Lakes,
W73-11703 4A

LAKE MAUREPAS (LA)
Occurrence, Distribution and Density of Rangia Cuneata in Lakes Pontchartrain and Maurepas, Louisiana,
W73-11957 5C

LAKE MENDOTA (WIS)
Nutrient Sources for Lake Mendota--1972,
W73-11960 5B

LAKE MICHIGAN
Remote Sensing Study of Thermal Discharges to Lake Michigan, Wisconsin, Illionois, Indiana, and Michigan.
W73-12309 5B

LAKE MORPHOMETRY
Hypsometry of Lower Chateaugay Lake and a Pond on the Saranac River,
W73-12327 2H

Hypsometric Map of Harris Lake, New York,
W73-12328 2H

LAKE ONTARIO
Some Kinetic Energy Spectra in a Nearshore Region of Lake Ontario,
W73-12084 2E

LAKE PONTCHARTRAIN (LA)
Occurrence, Distribution and Density of Rangia Cuneata in Lakes Pontchartrain and Maurepas, Louisiana,
W73-11957 5C

LAKE SUPERIOR
A Synoptic Study of Food Habits of 30 Fish Species from Western Lake Superior,
W73-11959 2H

LAKE TAHOE
A Case Study in Interstate Resource Management: The California-Nevada Water Controversy, 1865-1955,
W73-11705 6B

LAKES
Salts in the Sea,
W73-11812 2K

Methane in Lake Kivu: New Data Bearing on its Origin,
W73-11837 2K

A Model of Seasonal Changes in Total Nitrogen Concentration in the Lake Wingra Water Column,
W73-11911 8B

Zooplankton Composition and Change in an Alpine Lake,
W73-11944 5C

Effects of Artificial Aeration on the Chemistry and Algae of Two Michigan Lakes,
W73-11958 5C

Nutrient Sources for Lake Mendota--1972,
W73-11960 5B

Studies on Freshwater Micro-Organisms: Phosphatase Activity in Lakes of Differing Degrees of Eutrophication,
W73-12089 5C

Ecological Studies on Crater Lakes in West Cameroon Fishes of Barombi, Mbo,
W73-12168 2H

State University of New York, College at Plattsburgh, Lakes and Rivers Research Laboratory 1972 Technical Report.
W73-12321 5B

Toxicity of Lead Nitrate to Five Species of Freshwater Algae,
W73-12322 5C

Studies on the Seasonal and Spatial Distribution of Phosphates, Nitrates, and Silicates in Lake Champlain,
W73-12323 5B

Orthophosphate Concentrations and Distributions in Northwest Bay: 1971-1972,
W73-12324 5B

A General Model for Vertical Thermal Stratification in Ice Free Lakes,
W73-12326 2H

LAND DISPOSAL
Recycling Sludge and Sewage Effluent by Land Disposal.
W73-12334 5D

LAND MANAGEMENT
Natural Resource Information System, Volumes I and II.
W73-12040 6A

LAND RECLAMATION
Recycling Sludge and Sewage Effluent by Land Disposal.
W73-12334 5D

LAND USE
National Land Use Policy: Objectives, Components, Implementation.
W73-12048 6E

LANDFILLS
Potential for Ground Water Pollution from the Land Disposal of Solid Wastes,
W73-12025 5B

LANDSLIDES
Current Slope-Stability Studies in the San Francisco Bay Region,
W73-12065 2J

LASER-EXCITED RAMAN SPECTROSCOPY
Feasibility of Remote Detection of Water Pollutants and Oil Slicks by Laser-Excited Raman Spectroscopy,
W73-12137 5A

LAW OF THE SEA
The Seabed Arms Control Treaty: A Study in the Contemporary Law of the Military Uses of the Seas,
W73-11965 6E

LEACHING
Field Studies on Salt Leaching in a Highly Saline Sodic Soil,
W73-11835 2G

Solidification of Medium Activity Liquid Residues with Bitumen (Solidifiction Par Le Bitume De Residus Liquides De Moyenne Activite),
W73-11922 5D

LEAD
Distribution of Mercury, Cadmium, Lead and Thallium in a Eutrophic Lake,
W73-11707 5B

Toxicity of Lead Nitrate to Five Species of Freshwater Algae,
W73-12322 5C

LEAD ELECTRODES
Titration of Sulphate in Mineral Waters and Sea Water by Using the Solid-State Lead Electrode,
W73-11818 2K

LEASES
Burns V. Coastal Petroleum Company (Action to Determine Whether Bottom of Lake was Included within Oil and Mineral Lease).
W73-11968 6E

Oil and Gas--Rights of Mineral Lessee in Use of Surface Owner's Fresh Water for Secondary Recovery Purposes, Sun Oil V. Whitaker.
W73-12212 6E

LEAST SIGNIFICANT DIFFERENCE
An Evaluation of Ten Pairwise Multiple Comparison Procedures by Monte Carlo Methods,
W73-12100 5A

LEAVES
Ecology of Indian Desert. VIII: On the Water Relations and Assimilate Balance of some Desert Plants,
W73-12254 2I

LEE COUNTY (FLA)
The Effects of Plugging a Deep Artesian Well on the Concentration of Chloride in Water in the Water-Table Aquifer at Highland Estates, Lee County, Florida,
W73-12039 2F

LEGAL ASPECTS
Legal Problems in Regulating Flood Hazard Areas,
W73-12004 6F

Judicial-Oriented Institutional Solutions: San Gabriel Valley Experience,
W73-12009 4B

LEGAL REVIEW
Milldams and Races.
W73-11992 6E

Citizens for Clean Air, Inc. V. Corps of Engineers, U.S. Army (Public Hearing Not Required Under the NEPA).
W73-12209 6E

Save Our Ten Acres V. Kreger (Standard of Judicial Review of Agency Action Under Nepa).
W73-12218 6E

Dams and Spillways (Hearings and Appeal).
W73-12220 6E

Individual Drainage Rights.
W73-12229 6E

LEGISLATION
An Act Proposing an Amendment to Article IV, Section 93, as Amended, of the Constitution of Alabama Relative to Providing Irrigation and Water Conservation in the State.
W73-11963 6E

Department of Environmental Quality; Executive Committee.
W73-11964 6E

Drainage under State Laws (Minnesota and Arkansas).
W73-11966 6E

Utilization of Ground Water Resources.
W73-11971 6E

Marine Sanctuaries in California.
W73-11973 6E

Pollution Control Under the Pennsylvania Clean Streams Law,
W73-11976 6E

Flood and Erosion Control.
W73-11978 6E

Soil Conservation and Flood Control Districts.
W73-11979 6E

An Act Relating to Irrigation and Water Conservation.
W73-11980 6E

Interstate Drainage Districts.
W73-11981 6E

Operation of Watercraft.
W73-11982 6E

Little Calumet River Basin Commission.
W73-11983 6E

Environmental Management.
W73-11986 6E

Flood Control.
W73-11987 6E

Benefited Water Districts.
W73-11988 6E

Upper Mississippi Riverway Compact.
W73-11989 6E

Protection from Floods.
W73-11990 6E

Milldams and Races.
W73-11992 6E

Big Cypress Preserve, Florida.
W73-11993 6E

Deep Draft Harbor and Terminal Authority.
W73-11994 6E

Jackson-Bienville Parishes Dugdemona Watershed District.
W73-11995 6E

Greater Baton Rouge Water Conservation District.
W73-11996 6E

Soil Conservation.
W73-12002 6E

Water and Air Pollution Control Act.
W73-12003 6E

(A Bill to be Entitled: The Oil Pollution Compensation Act of 1973).
W73-12191 6E

Report on Public Hearings on the Adoption of Proposed Regulations for the Purpose of Implementing the Water and Air Quality Reporting Act of 1971.
W73-12198 5G

A Bill to Assure the Public Is Provided with an Adequate Quantity of Safe Drinking Water.
W73-12199 6E

Discharge of Untreated Wastes into the Mississippi River.
W73-12204 6E

Safe Drinking Water.
W73-12205 5G

Proposed Florida Frontier Rivers National Cultural Park.
W73-12206 6E

Designating Rock Creek in Montana as Part of the Wild and Scenic Rivers System.
W73-12207 6E

The Federal Water Pollution Control Act Amendments of 1972: Effective Controls at Last,
W73-12214 5G

Water Pollution Control.
W73-12216 6E

Louisiana Coastal Commission.
W73-12217 6E

Consciousness of Streams: The 1971 Alabama Water Pollution Control Act.
W73-12219 6E

Dams and Spillways (Hearings and Appeal).
W73-12220 6E

Watercourses--Canals--Toll Bridges,
W73-12221 6E

Drainage Maintenance and Repair Districts.
W73-12222 6E

Drains and Watercourses Affecting Highways.
W73-12223 6E

Protection of Lakes.
W73-12224 6E

Levees.
W73-12225 6E

Levee Authority Districts.
W73-12226 6E

Groundwater Conservation.
W73-12227 6E

Environmental Policy.
W73-12228 6E

Individual Drainage Rights.
W73-12229 6E

LEGISLATIVE INTERPRETATION
Burns V. Coastal Petroleum Company (Action to Determine Whether Bottom of Lake was Included within Oil and Mineral Lease).
W73-11968 6E

LEHIGH RIVER
Flood Plain Information, Lehigh River, Jordan Creek and Trout Creek, City of Allentown, Pennsylvania.
W73-12238 4A

LEVEE DISTRICTS
Levee Authority Districts.
W73-12226 6E

LEVEES
Levees.
W73-12225 6E

Levee Authority Districts.
W73-12226 6E

LIABILITY
(A Bill to be Entitled: The Oil Pollution Compensation Act of 1973).
W73-12191 6E

LICHENS
Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

LIFE CYCLES
Distribution of the Cladoceran Podon Polyphemoides in the Chesapeake Bay,
W73-12152 5A

Mosquitoes of Arizona,
W73-12243 4A

LIFE HISTORY STUDIES
The Life History of the Alderfly, Sialis Aequalis Banks, in an Acid Mine Stream,
W73-12136 5A

LIGHT
The Light Threshold Controlling the Vertical Migration of Chaoborus Punctipennis in a Georgia Impoundment,
W73-11943 5C

LIGHTNING ARRESTERS
The Sparking of Lightning Arresters Due to Conductive Contaminants,
W73-11722 8C

LIMITING FACTORS
The Effects of Ammonium and Phosphate Enrichments on Chlorophyll A, Pigment Ratio and Species Composition of Phytoplankton of Vineyard Sound,
W73-12116 5C

Silicon and the Ecology of Marine Plankton Diatoms. I. Thalassiosira pseudonana (Cyclotella nana) Grown in a Chemostat with Silicate as Limiting Nutrient,
W73-12119 5C

Effect of Nitrate, Ammonia and Nitrogen Starvation on the Regulation of Nitrate Reductase in Cyanidium Caldarium,
W73-12130 5C

LIMNOLOGY
State University of New York, College at Plattsburgh, Lakes and Rivers Research Laboratory 1972 Technical Report.
W73-12321 5B

Modules for Integrated Aquatic Modeling,
W73-12325 5B

LINER PLATES
Shield Tunnelling With Liner Plates,
W73-11732 8A

LIQUID WASTES
Liquid Filtering Apparatus,
W73-11898 5D

LITHIUM
A Pedochemical Survey: I. Lithium,
W73-12331 2K

LITTLE RIVER INLET (N.C. AND S.C.)
Little River Inlet North Carolina and South Carolina--Navigation (Final Environmental Impact Statement).
W73-12202 4A

LITTORAL DRIFT
The Significance of Time-Dependent Transports in Storm-Generated Coastal Currents,
W73-11816 2J

LITTORAL FAUNA
The Littoral Fauna of Llyn Celyn, North Wales,
W73-12345 2H

LOBSTERS
Growth Per Moult of Tagged Lobsters (Homarus americanus) in Bonavista Bay, Newfoundland,
W73-11914 8I

LONG TERM PLANNING
An Interactive Analysis of Natural Resource Allocation in a Contemporary Estuarine Ecosystem,
W73-11710 6B

LOUISIANA
Winter and Summer Shelter for Beef Cattle in Louisiana,
W73-11768 5B

Crayfish Farming in the United States,
W73-11848 6D

Utilization of Ground Water Resources.
W73-11971 6E

Sabine River Authority.
W73-11975 6E

Deep Draft Harbor and Terminal Authority.
W73-11994 6E

Jackson-Bienville Parishes Dugdemona Watershed District.
W73-11995 6E

Greater Baton Rouge Water Conservation District.
W73-11996 6E

A Seasonal Study of the Vegetation on Levees,
W73-12166 2I

Red River Emergency Bank Protection, Louisiana, Arkansas, and Texas (Final Environmental Impact Statement).
W73-12196 4A

Discharge of Untreated Wastes into the Mississippi River.
W73-12204 6E

Louisiana Coastal Commission.
W73-12217 6E

LOW-PERMEABILITY ZONE
Studies of Saprolite and Its Relation to the Migration and Occurrence of Groundwater in Crystalline Rocks,
W73-11706 2G

LUMBRICIDS
Aspects of the Biology of the Lumbricids Eiseniella Tetraedra (Savigny) and Dendrobaena Rubida (Savigny) F. Subrubicunda (Eisen) in a Percolating Filter,
W73-12175 5C

LYSIS
Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

LYSOGENICITY
Typing of Salmonella Weltevreden Strains by Means of Lysis Patterns of Symbiotic Phages,
W73-12121 5A

MADISON (WIS)
Effect of Diversion of Domestic Waste Waters on Phosphorus Content and Eutrophication of the Madison Lakes,
W73-11946 5C

MAGNESIUM
Magnesium to Chlorinity Ratios in Seawater,
W73-12086 2K

MAINE
Sewer and Water Utility Report,
W73-12236 5D

MAIZE-M
Weather Factors Affecting the Development of Maize from Sowing to Flowering,
W73-12346 3F

MANAGEMENT
Management Science, Economics and Environmental Science,
W73-11867 6A

Upper Trinity River Basin Comprehensive Sewerage Plan, Volume III, Management and Finance Program.
W73-12010 5D

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. I.
W73-12269 4A

MAPPING
Feasibility Study of the Exploitation of Electromagnetic Surface Wave Propagation for Mineral Prospecting and Mapping the Water Table,
W73-12311 2F

Hypsometry of Lower Chateaugay Lake and a Pond on the Saranac River,
W73-12327 2H

Hypsometric Map of Harris Lake, New York,
W73-12328 2H

MAPS
The Prediction of Soil Occurrence in Certain Desert Regions of the Southwestern United States,
W73-12256 2G

MARINE ALGAE
Alkaline Phosphatase Activity in the Tropical Marine Blue-Green Alga, Oscillatoria Erythraea ('Trichodesmium'),
W73-11952 5C

MARINE BIBLIOGRAPHY (R I)
Rhode Island Marine Bibliography.
W73-12316 2L

MARINE BIOLOGY
Mercury Levels in Marine Biota,
W73-12195 5C

MARINE BIOMES
Implications of a Systems Approach to Oceanography,
W73-11868 6A

MARINE ECOSYSTEMS
Implications of a Systems Approach to Oceanography,
W73-11868 6A

MARINE FISH
Cadmium Content of Sea Water, Bottom Sediment and Fish, and Its Elimination Rate in Fish,
W73-12264 5B

A Simple Method for the Activation Analysis of Mercury in Fish: Mercury Content in Venezuelan Canned Tuna,
W73-12267 5A

MARINE FUNGI
Fungi of the Chesapeake Bay and its Tributaries II. The Genus Conioscypha,
W73-11861 5A

Role of Marine Fungi in the Biochemistry of the Oceans. V. Patterns of Constitutive Nutritional Growth Responses,
W73-12154 5A

MARINE PLANTS
Seaweeds as Manure III. Field Manurial Trials on Pennisetum Typhoids S. H. (Pearl Millet) and Arachis Hypogea (Groundnut),
W73-11941 5C

MARKING
An Evaluation of Selected Marks and Tags for Marking Recently Metamorphosed Sea Lampreys,
W73-12251 2H

MARKOV PROCESSES
Effect of Length of Records of Monthly Flows on the First Serial Correlation Coefficient,
W73-12285 2E

Stochastic Models for Precipitation,
W73-12287 2B

MARSH PLANTS
Distribution of the Salt Marsh Snail (Melampus Bidentatus Say) in Relation to Marsh Plants in the Poropotank River Area, Virginia,
W73-12164 2L

MARSHES
The Great Marsh, Lewes, Delaware--The Physiography, Classification and Geologic History of a Coastal Marsh,
W73-12033 2L

MARYLAND
Water Quality of the Potomac Estuary Gilbert Swamp and Allen's Fresh and Gunston Cove.
W73-12078 2K

MARYLAND (ANNE ARUNDEL CO.)
The Vascular Flora of Anne Arundel County, Maryland: An Annotated Checklist,
W73-12170 2L

MASS BALANCE
A Two-Year Mass-Balance Study of the Rusty Glacier, 1968-1969,
W73-11798 2C

MASSACHUSETTS
A Study of the Marine Resources of the Waquoit Bay-Eel Pond Estuary,
W73-12173 2L

MASSACHUSSETTS
The Environmental Impact of Ground Water use on Cape Cod--Impact Study No. 3,
W73-12303 5B

MATHEMATICAL MODELS
Systems Analysis of the Great Lakes,
W73-11703 4A

Mathematical Simulation of Energy Metabolism in Beef Animals,
W73-11779 5B

Applications of a Derived Formula for the Discharge of Radioactive Liquid Wastes,
W73-11901 5C

A Dynamic Model of the Phytoplankton Population in the Sacramento-San Joaquin Delta,
W73-11937 5C

The Use of Radioactive Isotopes to Measure the Transfer of Materials in Aquatic Food Chains,
W73-12153 5A

Environmental Control Systems: Treatment of Uncertainty in Models and Data,
W73-12271 6A

A Plan for the Construction and Testing of Water Pollution Forecasting Models,
W73-12281 5B

Tests of Stationarity of Hydrologic Time Series,
W73-12286 2A

Stochastic Stream Temperature Model,
W73-12289 4A

Modules for Integrated Aquatic Modeling,
W73-12325 5B

A General Model for Vertical Thermal Stratification in Ice Free Lakes,
W73-12326 2H

MATHEMATICAL PROGRAMMING
Metropolitan Water Intelligence Systems - Completion Report, Phase II,
W73-11704 5G

MATHEMATICAL STUDIES
Modeling in the Eastern Deciduous Forest Biome,
W73-11907 2E

MATRIC SUCTIONS
Matric Suctions to Which Soils in South Central England Drain,
W73-12172 2G

MAYFLIES
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

A New Species of Baetis (Ephemeroptera) From Ponds in the Canadian Arctic, with Biological Notes,
W73-12157 5A

MEANDERS
The Meandering of Alluvial Rivers,

Diffusion of Sodium Chloride in Cellulose and Amylose Acetates,
W73-11758 3A

Water Diffusion through Cellulose and Amylose Acetates,
W73-11759 3A

Reverse Osmosis Studies of Cellulose and Amylose Acetates,
W73-11761 3A

MENYANTHACEAE
A Fen on the Northern California Coast,
W73-12350 2L

MERCURY
Distribution of Mercury, Cadmium, Lead and Thallium in a Eutrophic Lake,
W73-11707 5B

Kinetics of Microbially Mediated Methylation of Mercury in Aerobic and Anaerobic Aquatic Environments,
W73-11711 5B

A Study of the Extraction and Determination of Some Organo-Mercury (II) Compounds,
W73-11930 5A

Mercury: Vertical Distribution at Two Locations in the Eastern Tropical Pacific Ocean,
W73-12186 5B

Mercury Levels in Marine Biota,
W73-12195 5C

Activation Analysis of Mercury in Biological Samples,
W73-12260 5A

Uptake of Mercury by Plants and its Distribution in Living Organisms in an Environment With Increased Concentration of This Element,
W73-12262 5C

Some Remarks on Mercury as an Aquatic Pollutant and its Implications,
W73-12263 5C

Significance of Mercury in the Environment: Suggestions for Further Research,
W73-12265 5C

A Simple Method for the Activation Analysis of Mercury in Fish: Mercury Content in Venezuelan Canned Tuna,
W73-12267 5A

The Distribution of Dissolved Mercury in the Bristol Channel and Severn Estuary,
W73-12301 5B

MERRIMACK RIVER BASIN
Water Supply and Sewerage Planning in Central Merrimack Valley Region: Phase One.
W73-12043 5G

MESQUITE
Water-Stress Patterns in Honey Mesquite,
W73-12252 2I

METABOLISM
Metabolism of Phenol and Cresols by Mutants of Pseudomonas Putida,
W73-12139 5B

METAL TEST
Procedures for Evaluation of Fracture Toughness of Heat-Affected Zones,
W73-11721 8G

METEORIC WATER
Research in the Development and Utilization of Atmospheric Water Resources in Montana,
W73-11712 3B

METEOROLOGICAL
Research in the Development and Utilization of Atmospheric Water Resources in Montana,
W73-11712 3B

METEOROLOGICAL DATA
Precipitation Probabilities for Kentucky,
W73-12304 2B

METHANE
Methane in Lake Kivu: New Data Bearing on its Origin,
W73-11837 2K

METHANOL
Isolation of New Methanol-Utilizing Bacteria and its Thiamine-Requirement for Growth,
W73-12122 5A

METHANOL BACTERIA
Isolation of New Methanol-Utilizing Bacteria and its Thiamine-Requirement for Growth,
W73-12122 5A

METHANOMONAS METHYLOVORA
Isolation of New Methanol-Utilizing Bacteria and its Thiamine-Requirement for Growth,
W73-12122 5A

METHODOLOGY
Specific Identification of Enteroviruses by Immuno-Electron Microscopy Using a Serum-In-Agar Diffusion Method,
W73-12109 5A

Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

Comparison of the Precision of Normal and Precision Spectrophotometric Techniques,
W73-12143 5A

Vibrio Parahaemolyticus-Isolation, Identification, Classification, and Ecology,
W73-12144 5A

A Unified Method for the Reconstruction of Sampled Data,
W73-12147 5A

Report of Analyses of Water Samples Submitted to Scripps November 1971 for the Lake Michigan Intercalibration/Intercomparison Program (EIIP),
W73-12156 5A

Environmental Control Systems: Treatment of Uncertainty in Models and Data,
W73-12271 6A

MEXICO (WEST COAST)
Mercury: Vertical Distribution at Two Locations in the Eastern Tropical Pacific Ocean,
W73-12186 5B

MICROBIAL DEGRADATION
Metabolism of Phenol and Cresols by Mutants of Pseudomonas Putida,
W73-12139 5B

MICROECONOMICS
Management Science, Economics and Environmental Science,
W73-11867 6A

MICROENVIRONMENT
Nutrient Availability in Desert Grassland Soils Under Mesquite (Prosopis juliflora) Trees and Adjacent Open Areas,
W73-12250 2I

MICROORGANISMS
Kinetics of Microbially Mediated Methylation of Mercury in Aerobic and Anaerobic Aquatic Environments,
W73-11711 5B

Sewage Disposal Method,
W73-11880 5D

Effect of Clay on the Availability of Dilute Organic Nutrients to Steady-State Heterotrophic Populations,
W73-11954 5C

Some Factors Influencing Kinetic Constants for Microbial Growth in Dilute Solution,
W73-11956 5C

MICROSCOPY
Correlated Light and Electron Microscope Studies on Brown Algae. I. Localization of Alginic Acid and Sulphated Polysaccharides in Dictyota,
W73-11939 5C

MICROWAVE RADIOMETRY
Oil Spills: Measurements of Their Distributions and Volumes by Multifrequency Microwave Radiometry,
W73-11838 5A

MICROWAVES
Oil Spills: Measurements of Their Distributions and Volumes by Multifrequency Microwave Radiometry,
W73-11838 5A

Microwave Signatures of First-Year and Multiyear Sea Ice,
W73-12081 7B

MILITARY ASPECTS
The Seabed Arms Control Treaty: A Study in the Contemporary Law of the Military Uses of the Seas,
W73-11965 6E

MILL DAMS
Milldams and Races.
W73-11992 6E

MINE WASTES
Pollution Control Under the Pennsylvania Clean Streams Law,
W73-11976 6E

MINERAL INDUSTRY
Marine Sanctuaries in California.
W73-11973 6E

Exploitation of Seabed Mineral Resources--Chaos or Legal Order,
W73-12210 6E

MINERALOGY
Feasibility Study of the Exploitation of Electromagnetic Surface Wave Propagation for Mineral Prospecting and Mapping the Water Table,
W73-12311 2F

MINERALS
Bryophytes as a Guide to Mineralisation,
W73-12337 2I

MINING
Geology for Planning in St. Clair County, Illinois.
W73-12069 2F

MINNOW
Population Biology of the Helminth Parasites of Phoxinus Phoxinus (L.) The Minnow, in a Cardiganshire Lake,
W73-11716 2H

MISSISSIPPI
Channel Conditions, Devil's Island Reach, Mississippi River, Missouri and Illinois,
W73-11821 8B

Bowie Dam and Lake Pascagoula River Basin, Mississippi and Alabama (Final Environmental Statement).
W73-11977 8A

MISSISSIPPI RIVER
Shoaling Conditions, St. Louis Harbor, Mississippi River,
W73-11856 8B

Upper Mississippi Riverway Compact.
W73-11989 6E

Geology for Planning in St. Clair County, Illinois.
W73-12069 2F

MISSISSIPPI RIVER BASIN
The Potential Radiological Implications of Nuclear Facilities in the Upper Mississippi River Basin in the Year 2000.
W73-11918 5B

MISSOURI
Nitrates Danger for Humans, Too,
W73-11781 5B

Shoaling Conditions, St. Louis Harbor, Mississippi River,
W73-11856 8B

Missouri Water Quality Standards Summary.
W73-12034 5G

A Plan for the Construction and Testing of Water Pollution Forecasting Models,
W73-12281 5B

MISSOURI RIVER
A Proposal for a Model River Project Concerning 'Riverfront Beautification and Utilization in Metropolitan Areas.'
W73-12235 6B

MODEL STUDIES
Development of a State Water-Planning Model, Part IV, Data Preparation,
W73-11708 6A

Development of a State Water-Planning Model, Part V, Data Bank Operators Manual,
W73-11709 6A

Population and Pollution in the United States,
W73-11869 6A

Time to Chemical Steady-States in Lakes and Oceans,
W73-11936 2K

Summary Report on The Upper Bear Creek Experimental Project.
W73-12026 2A

Some Properties of Probability Lattice Sampling,
W73-12099 5A

Heterogeneous-Site Glass Membrane Potentials-A Solid-State Approach,
W73-12102 5A

Evaluation of Prediction Error Probabilities From Stochastic Models by Simulation,
W73-12275 4A

Reduction of Uncertainties in Autocorrelation by the Use of Physical Models,
W73-12283 2A

Physical Assumptions and Their Consequences on Modelling Groundwater Movement,
W73-12288 4B

Numerical Model Studies of the St. Lawrence River,
W73-12313 2L

MOISTURE
Soil Physical Conditions Affecting Seedling Root Growth: II. Mechanical Impedance, Aeration and Moisture Availability as Influenced by Grain-Size Distribution and Moisture Content in Silica Sands,
W73-12163 2I

MOISTURE STRESS
Water-Stress Patterns in Honey Mesquite,
W73-12252 2I

Ecology of Indian Desert. VIII: On the Water Relations and Assimilate Balance of some Desert Plants,
W73-12254 2I

MOLECULAR STRUCTURE
The Influence of Surfaces on the Structure of Water,
W73-11754 1B

MOLLUSKS
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

MONITORING
Environmental Monitoring Report for Sandia Laboratories from 1964 Through 1972,
W73-11908 5A

Environmental Monitoring in the Vicinity of the Los Alamos Scientific Laboratory - Calendar Year 1972.
W73-11909 5A

Radiological Status of the Groundwater Beneath the Hanford Project - July-December, 1971,
W73-11923 5A

Delayed-Incubation Membrane-Filter Test for Fecal Coliforms,
W73-12120 5A

Report on Public Hearings on the Adoption of Proposed Regulations for the Purpose of Implementing the Water and Air Quality Reporting Act of 1971.
W73-12198 5G

Bayesian Estimation and Design of Experiments for Growth Rates, With Applications to Measuring Water Quality,
W73-12270 5A

MONTANA
Comparison of Moraines Formed by Surging and Normal Glaciers,
W73-11793 2C

Designating Rock Creek in Montana as Part of the Wild and Scenic Rivers System.
W73-12207 6E

MONTANA (MADISON RIVER)
Distribution and Age of Margaritifera Margaritifera (L) in a Madison River (Montana, USA) Mussle Bed,
W73-12159 2I

MONTE CARLO METHOD
Methods for Assessing Variability, With Emphasis on Simulation Data Interpretations,
W73-12274 7C

Flood Evaluation - Can Stochastic Models Provide an Answer,
W73-12276 7C

Reliability and Uncertainty in Predicting Transport Processes in Natural Streams and Rivers,
W73-12279 4A

MONTE CARLO METHODS
Streamflow Frequency Using Stochastically Generated Hourly Rainfall,
W73-12284 2E

Information Transfer Via Regression in Markovian Worlds,
W73-12294 6A

MONTSWEAG BAY
Final Environmental Statement Related to Operation of Maine Yankee Atomic Power Station.
W73-11899 5C

MORA COUNTY (N MEX)
Ground-Water Resources of the Mora River Drainage Basin, Western Mora County, New Mexico,
W73-12035 2F

MORA RIVER DRAINAGE BASIN (N MEX)
Ground-Water Resources of the Mora River Drainage Basin, Western Mora County, New Mexico,
W73-12035 2F

MORPHOLOGICAL STUDIES
An Analysis of Morphological Variation: A Comparison of Some Stream-Dwelling Fishes,
W73-12179 2I

MORTALITY
Effect of Zinc on Growth and Development of Larvae of the Pacific Oyster Crassostrea gigas,
W73-12118 5C

MOSQUITOES
Mosquitoes of Arizona,
W73-12243 4A

MOSQUITOS
Observations on Paramecium Occupying Arboreal Standing Water in Costa Rica,
W73-12340 2I

MOSSES
Bryophytes as a Guide to Mineralisation,
W73-12337 2I

MOST PROBABLE NUMBER TEST
Discrepancies in the Enumeration of Escherichia coli,
W73-12107 5A

MOUNTAIN CREEK (TEX)
Annual Compilation and Analysis of Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1971,
W73-12038 2E

MOUNTAINS
Design Characteristics of Storm Precipitation in the Carpathians (Raschetnyye kharakteristiki dozhdevykh osadkov v Karpatakh),
W73-11827 2B

Possibility of Using Storage Precipitation Gages to Improve the Accuracy of Precipitation Data in the Ukrainian Carpathians (O vozmozhnosti utochneniya kolichestva osadkov v Ukrainskikh Karpatakh po dannym summarnykh osadkomerov) ,
W73-11828 2B

Role of Natural and Anthropogenic Factors in Mudflow Formation in the Ukrainian Carpathians (O roli prirodnykh i antropogennykh faktorov v seleobrazovanii v Ukrainskikh Karpatakh),
W73-11830 2J

MUD
How Weather Affects Feedlot Performance.
W73-11772 5B

MUDFLOWS
Observations on an Alpine Mudflow, Steele Creek,
W73-11795 2C

Role of Natural and Anthropogenic Factors in Mudflow Formation in the Ukrainian Carpathians (O roli prirodnykh i antropogennykh faktorov v seleobrazovanii v Ukrainskikh Karpatakh),
W73-11830 2J

Investigation of Mudflows in the Cheremosh River Basin in Connection with Design of the Rostoki Reservoir (Issledovaniye seley v basseyne r. Cheremosh v svyazi s proyektirovaniyem Rostokinskogo vodokhranilishcha),
W73-11831 2J

MULTIPLE PURPOSE PROJECTS
Louisiana Coastal Commission.
W73-12217 6E

MULTIPLE-PURPOSE RESERVOIRS
Bowie Dam and Lake Pascagoula River Basin, Mississippi and Alabama (Final Environmental Statement).
W73-11977 8A

MUNICIPAL WASTES
Urban Systems Engineering Demonstration Program. Volume III: Areawide Solid Waste Management,
W73-12018 5E

MUSSEL BEDS
Distribution and Age of Margaritifera Margaritifera (L) in a Madison River (Montana, USA) Mussle Bed,
W73-12159 2I

MUTANTS
Metabolism of Phenol and Cresols by Mutants of Pseudomonas Putida,
W73-12139 5B

MYCOBACTERIOPHAGE
Partial Characterization of Mycobacteriophage R1 Particles Surviving Chloroform Treatment,
W73-12124 5A

NALEDS
Seasonal Regime and Hydrological Significance of Stream Icings in Central Alaska,
W73-12314 2C

NANOPLANKTON
Net Plankton and Nanoplankton Production and Biomass in a North Temperate Zone Lake,
W73-11951 5C

NATCHEZ (MISS)
Inventory and Analysis of Existing Water and Sewer Systems and Long Range Water and Sewer Plans, Natchez, Mississippi,
W73-12015 6D

NATIONAL ENVIRONMENTAL POLICY ACT
Citizens for Clean Air, Inc. V. Corps of Engineers, U.S. Army (Public Hearing Not Required Under the NEPA).
W73-12209 6E

NATIONAL PARKS
Proposed Florida Frontier Rivers National Cultural Park.
W73-12206 6E

NATIONAL WATER COMMISSION
Water Policies for the Future.
W73-12052 6B

NATIONAL WILD AND SCENIC RIVER SYSTEM
Designating Rock Creek in Montana as Part of the Wild and Scenic Rivers System.
W73-12207 6E

NATURAL GAS
Environmental Statement, Rio Blanco Gas Stimulation Project, Rio Blanco County, Colorado.
W73-12258 5A

NATURAL REGULATION
Natural Regulation of Runoff on Rivers in the Northwestern Ukraine (Yestestvennaya zaregulirovannost'stoka rek severo-zapada Ukrainy),
W73-11833 2E

NATURAL RESOURCES
Natural Features in Burlington County.
W73-12241 6G

NATURAL RESOURCES DATA PROCESSING
Natural Resource Information System, Volumes I and II.
W73-12040 6A

NATURAL SELECTION
Predation, Natural Selection and Adaptation in an Unusual Threespine Stickleback,
W73-12178 2I

NATURAL STREAMS
Reliability and Uncertainty in Predicting Transport Processes in Natural Streams and Rivers,
W73-12279 4A

NAVIGABLE WATERS
Brickell V. Trammell (Title Suit to Determine Ownership of Submerged Lands Along Navigable Body of Water).
W73-11967 6E

NAVIGATION
Shoaling Conditions, St. Louis Harbor, Mississippi River,
W73-11856 8B

Little River Inlet North Carolina and South Carolina--Navigation (Final Environmental Impact Statement).
W73-12202 4A

NEBRASKA
A Proposal for a Model River Project Concerning 'Riverfront Beautification and Utilization in Metropolitan Areas.'
W73-12235 6B

NEGLIGENCE
Ozark Industries, Inc. V. Stubbs Transports, Inc. (Action to Recover Fishkill Damages when Gasoline from Overturned Truck Found its Way into Springfed Trout Pool).
W73-12197 6E

NEODIPRION-SWAINEI
Observation on the Simulated Effects of Rain on Larva of Neodiprion Swainei (Hymenoptera, Diprionidae),
W73-12160 2I

NETWORKS
Space-Time Uncertainties in Precipitation Measurement,
W73-12293 2B

Design of USAF Water Quality Monitoring Programs,
W73-12317 5A

NEUTRON ACTIVATION ANALYSIS
Annotated Bibliography on 14-MEV Neutron Activation Analysis,
W73-11919 5A

Activation Analysis of Mercury in Biological Samples,
W73-12260 5A

A Simple Method for the Activation Analysis of Mercury in Fish: Mercury Content in Venezuelan Canned Tuna,
W73-12267 5A

NEUTRON METERS
Depth Intervals and Topsoil Moisture Measurement with the Neutron Depth Probe,
W73-11841 2G

NEVADA
Use of Satellite Imagery for Wildland Resource Evaluation In the Great Basin,
W73-12021 7B

NEW HAMPSHIRE
Richardson V. Schneider (Action Involving Dispute as to Ownership of Peninsula which Jutted Into Lake).
W73-12000 6E

NEW JERSEY
Sewerage Systems Report: Somerset County, N.J.
W73-12237 5D

Natural Features in Burlington County.
W73-12241 6G

NEW MEXICO
Ground-Water Resources of the Mora River Drainage Basin, Western Mora County, New Mexico,
W73-12035 2F

Drought Effects on a Semidesert Grassland Range,
W73-12247 2I

The Prediction of Soil Occurrence in Certain Desert Regions of the Southwestern United States,
W73-12256 2G

NEW YORK
The Problem of Phosphorus in New York's Waters.
W73-12012 5G

Movement and Quality of Long Island Sound Waters, 1971,
W73-12072 2K

State University of New York, College at Plattsburgh, Lakes and Rivers Research Laboratory 1972 Technical Report.
W73-12321 5B

Studies on the Seasonal and Spatial Distribution of Phosphates, Nitrates, and Silicates in Lake Champlain,
W73-12323 5B

Orthophosphate Concentrations and Distributions in Northwest Bay: 1971-1972,
W73-12324 5B

A General Model for Vertical Thermal Stratification in Ice Free Lakes,
W73-12326 2H

Hypsometry of Lower Chateaugay Lake and a Pond on the Saranac River,
W73-12327 2H

Hypsometric Map of Harris Lake, New York,
W73-12328 2H

NEW ZEALAND
A Pedochemical Survey: I. Lithium,
W73-12331 2K

Bryophytes as a Guide to Mineralisation,
W73-12337 2I

Production of Fish in Two Small Streams in the North Island of New Zealand,
W73-12347 2I

NEW ZEALAND (BROADLANDS)
Isotopic Compostion of Waters of the Broadlands Geothermal Field,
W73-12349 2K

NILE FISH
Studies on Factors Affecting Survival of Nile Fish in the Sudan. I. The Effect of Hydrogen Ion Concentration,
W73-12131 5C

Studies on Factors Affecting Survival of Nile Fish in the Sudan. II. The Effect of Temperature,
W73-12132 5C

Studies on Factors Affecting Survival of Nile Fish in the Sudan. III. The Effect of Oxygen,
W73-12133 5C

NITRATE REDUCTASE
Effect of Nitrate, Ammonia and Nitrogen Starvation on the Regulation of Nitrate Reductase in Cyanidium Caldarium,
W73-12130 5C

NITRATE REDUCTION
Effect of Water Stress and High Temperature on Nitrate Reduction in Citrus Leaves,
W73-12330 3F

NITRATES
Why Nitrates in Water Supplies,
W73-11765 5B

Nitrates Danger for Humans, Too,
W73-11781 5B

Distribution of Organics from Salmon Decomposition,
W73-11887 5B

NITROGEN
Role of Marine Fungi in the Biochemistry of the Oceans. V. Patterns of Constitutive Nutritional Growth Responses,
W73-12154 5A

Nitrogen Fertilizer Responses of Heteropogon Contortus and a Paspalum Plicatulum Pasture in Relation to Rainfall in Central Coastal Queensland,
W73-12341 3F

The Transformation of Nitrogen and Carbon in the Soil During Humification of Straw Labelled with N15,
W73-12342 2G

NITROGEN COMPOUNDS
Distribution of Organics from Salmon Decomposition,
W73-11887 5B

Ammonia Assimilation in Blue-Green Algae,
W73-12125 5B

NITROGEN CYCLE
A Model of Seasonal Changes in Total Nitrogen Concentration in the Lake Wingra Water Column,
W73-11911 8B

NITROGEN FIXATION
A Model of Seasonal Changes in Total Nitrogen Concentration in the Lake Wingra Water Column,
W73-11911 8B

NOMOGRAPHS
Shortcuts to Small-Sample Statistics Problems,
W73-12093 5A

NON-STRUCTURAL ALTERNATIVES
Legal Problems in Regulating Flood Hazard Areas,
W73-12004 6F

NON-STRUCTURED ALTERNATIVES
Surveys Required to Design Nonstructural Measures,
W73-12005 6F

NORTH CAROLINA
Regulation Relating to Monitoring and Reporting Wastewater Discharges and Their Effect Upon Receiving Waters.
W73-12194 5G

Report on Public Hearings on the Adoption of Proposed Regulations for the Purpose of Implementing the Water and Air Quality Reporting Act of 1971.
W73-12198 5G

Little River Inlet North Carolina and South Carolina--Navigation (Final Environmental Impact Statement).
W73-12202 4A

NORTH CAROLINA WATER AND AIR QUALITY REPORTING ACT OF 1971
Report on Public Hearings on the Adoption of Proposed Regulations for the Purpose of Implementing the Water and Air Quality Reporting Act of 1971.
W73-12198 5G

NORTH DAKOTA
Drainage Law in North Dakota: An Overview,
W73-12215 6E

NUCLEAR EXPLOSIONS
Environmental Statement, Rio Blanco Gas Stimulation Project, Rio Blanco County, Colorado.
W73-12258 5A

NUCLEAR MOISTURE METERS
Depth Intervals and Topsoil Moisture Measurement with the Neutron Depth Probe,
W73-11841 2G

NUCLEAR POWERPLANTS
Final Environmental Statement Related to Operation of Maine Yankee Atomic Power Station.
W73-11899 5C

Final Environmental Statement Related to Operation of Zion Nuclear Power Station Units 1 and 2.
W73-11900 5C

Final Environmental Statement Related to Operation of Surry Power Station Unit 2.
W73-11903 5C

Final Environmental Statement Related to Operation of Kewaunee Nuclear Power Plant.
W73-11904 5C

Report on Releases of Radioactivity in Effluents from Nuclear Power Plants for 1971.
W73-11905 5B

Final Environmental Statement Related to Operation of Fort Calhoun Station Unit 1.
W73-11906 5C

Environmental Monitoring in the Vicinity of the Los Alamos Scientific Laboratory - Calendar Year 1972.
W73-11909 5A

Some Features of the Impact of a Fusion Reactor Power Plant on the Environment,
W73-11910 5B

Final Environmental Statement Related to the Arkansas Nuclear One Unit 1.
W73-11913 5C

Final Environmental Statement Related to the Proposed Hanford Number Two Nuclear Power Plant.
W73-11917 5C

The Potential Radiological Implications of Nuclear Facilities in the Upper Mississippi River Basin in the Year 2000.
W73-11918 5B

Final Environmental Statement Related to Construction of Davis-Besse Nuclear Power Station.
W73-11920 5C

Radiological Status of the Groundwater Beneath the Hanford Project - July-December, 1971,
W73-11923 5A

Final Environmental Statement Related to Construction of Shearon Harris Nuclear Power Plant Units 1, 2, 3, and 4.
W73-11926 5C

Final Environmental Statement Related to the Proposed Crystal River Unit 3.
W73-11927 5C

Final Environmental Statement Related to Operation of Pilgrim Nuclear Power Station.
W73-11928 5C

Final Environmental Statement Related to Construction of Joseph M. Farley Nuclear Plant Units 1 and 2.
W73-11931 5C

Final Environmental Statement Related to Operation of Vermont Yankee Nuclear Power Station.
W73-11932 5C

NUCLEAR WASTES
Applications of a Derived Formula for the Discharge of Radioactive Liquid Wastes,
W73-11901 5C

Some Features of the Impact of a Fusion Reactor Power Plant on the Environment,
W73-11910 5B

Radioactive Waste Management at Hanford,
W73-11915 5D

Determination of the Diffusion Coefficient of Radioelements in the Rhone Sediments,
W73-11921 5B

Solidification of Medium Activity Liquid Residues with Bitumen (Solidifiction Par Le Bitume De Residus Liquides De Moyenne Activite),
W73-11922 5D

Radionuclides in River Systems,
W73-12259 5B

NUISANCE ALGAE
Occurrence and Distribution of Cyanophages in Ponds, Sewage and Rice Fields,
W73-12126 5A

NUTRIENT INTERCHANGE
Studies of Cation Budgets in the Southern Appalachians on Four Experimental Watersheds with Contrasting Vegetation,
W73-11860 2E

NUTRIENT REMOVAL
Nitrogen Removal from Waste Water by Breakpoint Chlorination,
W73-11890 5D

NUTRIENT REQUIREMENTS
Alkaline Phosphatase Activity in the Tropical Marine Blue-Green Alga, Oscillatoria Erythraea ('Trichodesmium'),
W73-11952 5C

Isolation of New Methanol-Utilizing Bacteria and its Thiamine-Requirement for Growth,
W73-12122 5A

Effect of Nitrate, Ammonia and Nitrogen Starvation on the Regulation of Nitrate Reductase in Cyanidium Caldarium,
W73-12130 5C

Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

NUTRIENTS
Influence of Dilution, Sinking and Grazing Rate on Phytoplankton Populations of Hyperfertilized Ponds and Microecosystems,
W73-11950 5C

Effect of Clay on the Availability of Dilute Organic Nutrients to Steady-State Heterotrophic Populations,
W73-11954 5C

Nutrient Sources for Lake Mendota--1972,
W73-11960 5B

Sites of Nutrient Absorption in Aquatic Macrophytes,
W73-12134 5C

Initial Studies on a Method of Algal Assay for Nutrient Parameters in Water,
W73-12158 5A

Studies on the Seasonal and Spatial Distribution of Phosphates, Nitrates, and Silicates in Lake Champlain,
W73-12323 5B

OBESUMBACTERIUM PROTEUS
The Taxonomic Position of Obesumbacterium Proteus, a Common Brewery Contaminant,
W73-12149 5A

OCEAN CURRENTS
The Significance of Time-Dependent Transports in Storm-Generated Coastal Currents,
W73-11816 2J

Currents in the Shore Zone of a Nontidal Sea (Techeniya beregovoy zony besprilivnogo morya),
W73-12060 2H

OCEAN WAVES
Statistics of Ocean Wave Groups,
W73-11817 2E

Attenuation of Swell by Sea Ice,
W73-12082 2C

The Directional Analysis of Ocean Waves: An Introductory Discussion (Second Edition),
W73-12306 2E

OCEANOGRAPHY
Implications of a Systems Approach to Oceanography,
W73-11868 6A

Rhode Island Marine Bibliography.
W73-12316 2L

OCEANS
Exploitation of Seabed Mineral Resources--Chaos or Legal Order,

Method for Removing Oil and Debris from Water,
W73-11886 5G

Method of Removing Oil Spills from Water,
W73-11891 5G

Floating Debris Recovery Apparatus,
W73-11893 5G

(A Bill to be Entitled: The Oil Pollution Compensation Act of 1973).
W73-12191 6E

Civil Liability for Oil Pollution,
W73-12213 5G

OIL SPILL
Method for Removing Oil and Debris from Water,
W73-11886 5G

OIL-SPILL EMULSIFIERS
Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

OIL SPILLS
Oil Spills: Measurements of Their Distributions and Volumes by Multifrequency Microwave Radiometry,
W73-11838 5A

Oil and Ice in the Arctic Ocean: Possible Large-Scale Interactions,
W73-11839 5B

Oil Skimming Apparatus,
W73-11873 5G

Skimming System,
W73-11876 5G

Oil Containment Boom,
W73-11882 5G

Method of Removing Oil Spills from Water,
W73-11891 5G

Floating Debris Recovery Apparatus,
W73-11893 5G

OLIGOCHAETES
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

ON-SITE DATA COLLECTIONS
A Submersible Spectroradiometer and Data Acquisition System,
W73-12135 5A

Automatic Meter Reading Using Existing Telephone Circuits,
W73-12145 5A

OPEN CUT CANALS
Determining the Best Sizes of the Open Cut Canals Used in Hydroameliorations,
W73-11870 6A

OPTIMIZATION
Metropolitan Water Intelligence Systems - Completion Report, Phase II,
W73-11704 5G

Optimal Gate Closure Schedule for Hydroelectric Turbine System,
W73-11742 8C

ORANGE RIVER DEV PROJ (SOUTH AFRICA)
The Hendrik Verwoerd Dam of the Orange River Project, South Africa.
W73-11740 8A

ORGANIC COMPOUNDS
Direct Observation of Reversible Formation of Anionic Sigma Complexes Related to Transition State Analogs for Adenosine Deaminase,
W73-11852 1B

A Study of the Extraction and Determination of Some Organo-Mercury (II) Compounds,
W73-11930 5A

Angular Dependence of Substituent Effects in Rigid, Bicyclic Systems,
W73-12305 2K

ORGANIC MATTER
Effect of Clay on the Availability of Dilute Organic Nutrients to Steady-State Heterotrophic Populations,
W73-11954 5C

Interstitial Water Composition in Barataria Bay (Louisiana) Sediment,
W73-12302 2L

Dissolved Organic Matter in Natural Waters: A Selected Bibliography, with Emphasis on Analytical Methods,
W73-12329 2H

ORIFICES
The Effect of Valve Area Gain on the Performance of the Hydraulic Servomechanism,
W73-11723 8C

OSCILLATORIA ERYTHRAEA
Alkaline Phosphatase Activity in the Tropical Marine Blue-Green Alga, Oscillatoria Erythraea ('Trichodesmium'),
W73-11952 5C

OTTAWA RIVER
Abundance and Diversity of Mollusca in an Industrialized Portion of the Ottawa River Near Ottawa-Hull, Canada,
W73-11862 5C

OUTER CONTINENTAL SHELF LANDS ACT
Marine Sanctuaries in California.
W73-11973 6E

OVERFLOW
Metropolitan Water Intelligence Systems - Completion Report, Phase II,
W73-11704 5G

OXIDATION LAGOONS
Performance of Beef Animals as Affected by Crowding and Thermal Environment During a Fall-Winter Period,
W73-11776 5D

Feeders Hear Woes of Confinement Start.
W73-11787 5D

OXIDATION-REDUCTION POTENTIAL
A Polythene Graphite Electrode for Voltammetry,
W73-12097 5A

OXYGEN
Studies on Carp Culture in Running Water Pond: IV. On Relation Between Diurnal Change of Water Qualities in the Fish Pond and Decrease of Fish Feeding (In Japanese),
W73-12174 8I

OXYGEN ISOTOPES
Abundances of Isotopic Species of Water in the St. Elias Mountains,
W73-11802 2C

OXYGENATION
Method and Apparatus for Determining Oxygen Consumption Rate in Sewage,
W73-11883 5D

OYSTERS
The Toxicity of Heavy Metals to Embryos of the American Oyster Crassostrea virginica,
W73-12113 5C

Effect of Zinc on Growth and Development of Larvae of the Pacific Oyster Crassostrea gigas,
W73-12118 5C

PACIFIC OCEAN
Hydrology of the Pacific Ocean (Gidrologiya Tikhogo okeana).
W73-12063 2L

Mercury: Vertical Distribution at Two Locations in the Eastern Tropical Pacific Ocean,
W73-12186 5B

PAINTS
Treatment of Phenolic Aircraft Paint Stripping Wastewater,
W73-12037 5D

PARAMECIUM
Observations on Paramecium Occupying Arboreal Standing Water in Costa Rica,
W73-12340 2I

PARAMETRIC HYDROLOGY
Variability of the Soil Water Flow Parameters and Their Effect on the Computation of Rainfall Excess and Runoff,
W73-12291 2G

PARKS
A Proposal for a Model River Project Concerning 'Riverfront Beautification and Utilization in Metropolitan Areas.'
W73-12235 6B

PARTICLE SIZE
Methods for Sampling and Determining Sieve Analysis of Aggregates Larger Than One and One-Half Inch Sieve,
W73-12070 8F

Coarse-Grained Sedimentation on a Braided Outwash Fan, Northeast Gulf of Alaska,
W73-12307 2L

PASCAGOULA RIVER BASIN (MISSISSIPPI-ALABAMA)
Bowie Dam and Lake Pascagoula River Basin, Mississippi and Alabama (Final Environmental Statement).
W73-11977 8A

PATENTS
Apparatus for the Separation of Ions from Solution,
W73-11871 3A

Sewage Treatment System,
W73-11872 5D

Oil Skimming Apparatus,
W73-11873 5G

Apparatus and System for Removal of Latex from Waste Water,
W73-11874 5D

Method and Apparatus for Separating Water from a Mixture of a Granular Material and Water,
W73-11875 5G

Skimming System,
W73-11876 5G

Multi-Stage Flash Evaporator for Distilling Brines,
W73-11877 3A

Waste Water Treatment System,
W73-11878 5D

Internal Precipitation of Phosphate in Settling Zone,
W73-11879 5D

Sewage Disposal Method,
W73-11880 5D

Method of Purifying Water,
W73-11881 5F

Oil Containment Boom,
W73-11882 5G

Method and Apparatus for Determining Oxygen Consumption Rate in Sewage,
W73-11883 5D

Liquid Filter,
W73-11884 5D

Submerged Filter-Horizontal Flow Mode,
W73-11885 5D

Method for Removing Oil and Debris from Water,
W73-11886 5G

Nitrogen Removal from Waste Water by Breakpoint Chlorination,
W73-11890 5D

Method of Removing Oil Spills from Water,
W73-11891 5G

Activated Sludge Sewage Treatment Process and System,
W73-11892 5D

Floating Debris Recovery Apparatus,
W73-11893 5G

Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

Method and Apparatus for Ecological Recycling of Waste Products to Produce Fertilizer and Garden Plant Nutrients,
W73-11895 5D

Water Purification,
W73-11896 5F

Domestic Sewage Treatment Plant,
W73-11897 5D

Liquid Filtering Apparatus,
W73-11898 5D

Poly (N-Amido)Imides as Semipermeable Membranes,
W73-12036 3A

PATH OF POLLUTANTS
A Survey of Dispersion Coefficients for Estimating Pollutant Transport,
W73-11814 5B

Applications of a Derived Formula for the Discharge of Radioactive Liquid Wastes,
W73-11901 5C

Determination of the Diffusion Coefficient of Radioelements in the Rhone Sediments,
W73-11921 5B

A Study of the Extraction and Determination of Some Organo-Mercury (II) Compounds,
W73-11930 5A

Potential for Ground Water Pollution from the Land Disposal of Solid Wastes,
W73-12025 5B

Turnover and Vertical Transport of Zinc by the Euphausiid Meganyctiphanes norvegica in the Ligurian Sea,
W73-12114 5B

Mercury Levels in Marine Biota,
W73-12195 5C

Radionuclides in River Systems,
W73-12259 5B

The Distribution of Dissolved Mercury in the Bristol Channel and Severn Estuary,
W73-12301 5B

Remote Sensing Study of Thermal Discharges to Lake Michigan, Wisconsin, Illionois, Indiana, and Michigan.
W73-12309 5B

State University of New York, College at Plattsburgh, Lakes and Rivers Research Laboratory 1972 Technical Report.
W73-12321 5B

PATHOGENS
Wind Dissemination of Waterborne Erwinia amylovora from Pyrus to Pyracantha and Cotoneaster,
W73-12338 3F

PEAK POWER
The Revin Pumped-Storage Plant,
W73-11726 8C

PEAR TREES
Wind Dissemination of Waterborne Erwinia amylovora from Pyrus to Pyracantha and Cotoneaster,
W73-12338 3F

PEDOCHEMICAL SURVEY
A Pedochemical Survey: I. Lithium,
W73-12331 2K

PELECYPODS
Abundance and Diversity of Mollusca in an Industrialized Portion of the Ottawa River Near Ottawa-Hull, Canada,
W73-11862 5C

PENNSYLVANIA
Pollution Control Under the Pennsylvania Clean Streams Law,
W73-11976 6E

Flood Plain Information, Lehigh River, Jordan Creek and Trout Creek, City of Allentown, Pennsylvania.
W73-12238 4A

Flood Plain Information, Little Lehigh Creek, Cedar Creek, Little Cedar Creek, Allentown, Pennsylvania.
W73-12239 4A

Variability of the Soil Water Flow Parameters and Their Effect on the Computation of Rainfall Excess and Runoff,
W73-12291 2G

PERFORMANCE EVALUATION
A Submersible Spectroradiometer and Data Acquisition System,
W73-12135 5A

Report of Analyses of Water Samples Submitted to Scripps November 1971 for the Lake Michigan Intercalibration/Intercomparison Program (EIIP),
W73-12156 5A

PERMAFROST
Vegetation, Microtopography, and Depth of Active Layer on Different Exposures in Subarctic Alpine Tundra,
W73-11809 2J

Ionic Migration and Weathering in Frozen Antarctic Soils,
W73-11836 2K

PERMITS
The Federal Water Pollution Control Act Amendments of 1972: Effective Controls at Last,
W73-12214 5G

PERMSELECTIVE MEMBRANES
Ionic Block Copolymers as Piezodialysis Membranes,
W73-11757 3A

PEST CONTROL
Mosquitoes of Arizona,
W73-12243 4A

PESTICIDE TOXICITY
Location and Consequences of 1,1,1-Trichloro-2,2-Bis (P-Chlorophenyl) Ethane Uptake by Bacillus Megaterium,
W73-12091 5B

Effects of Pesticides on Blue-Green Algae,
W73-12128 5C

PESTICIDES
Entomological Special Study No. 44-013-72/73, Laboratory Evaluation of Residues Maintained in Water Treated With Polyethylene Formulations of Chlorpyrifos, December 1971-April 1972,
W73-12042 5F

PHAEOPHYTA
Correlated Light and Electron Microscope Studies on Brown Algae. I. Localization of Alginic Acid and Sulphated Polysaccharides in Dictyota,
W73-11939 5C

PHAGE TYPING
Typing of Salmonella Weltevreden Strains by Means of Lysis Patterns of Symbiotic Phages,
W73-12121 5A

PHENOLS
Treatment of Phenolic Aircraft Paint Stripping Wastewater,
W73-12037 5D

Metabolism of Phenol and Cresols by Mutants of Pseudomonas Putida,
W73-12139 5B

PHENOTYPE
Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

PHOSPHATE
Internal Precipitation of Phosphate in Settling Zone,
W73-11879 5D

PHOSPHATES
Phosphate in Sediments Off South-Western Africa,
W73-11811 2J

Method of Purifying Water,
W73-11881 5F

Investigation of the Utility of Parallel Photometric Analysis as a New Approach for Environmental Determinations,
W73-11916 5A

The Problem of Phosphorus in New York's Waters.
W73-12012 5G

The Effects of Ammonium and Phosphate Enrichments on Chlorophyll A, Pigment Ratio and Species Composition of Phytoplankton of Vineyard Sound,
W73-12116 5C

Orthophosphate Concentrations and Distributions in Northwest Bay: 1971-1972,
W73-12324 5B

PHOSPHORUS
Effect of Diversion of Domestic Waste Waters on Phosphorus Content and Eutrophication of the Madison Lakes,
W73-11946 5C

PHOSPHORUS RADIOISOTOPES
The Movement of Phosphorous in the Little River Estuary, New South Wales,
W73-11912 5B

PHOSPHOTHIOATE PESTICIDES
Effects of Pesticides on Blue-Green Algae,
W73-12128 5C

PHOTOBACTERIUM
Deoxyribonucleic Acid Base Composition and Taxonomic Position of Glucose Fermenting Marine Bacteria of the Genus Vibrio and Related Genera, (Composition en Bases de L'Adn et Position Taxonomique de Bacteries Marines Fermentant le Glucose, du Genre Vibrio et des Genres Voisins),
W73-12090 5A

PHOTODECOMPOSITION
On the Photodecomposition of Chlorophyll in Vitro,
W73-12146 5C

PHOTOGRAPHY
Use of Satellite Imagery for Wildland Resource Evaluation In the Great Basin,
W73-12021 7B

PHOTOOXIDATION
On the Photodecomposition of Chlorophyll in Vitro,
W73-12146 5C

PHOTOSYNTHESIS
Photosynthesis by Algal Epiphytes of Utricularia in Everglades National Park,
W73-11947 5C

Evidence for Two Light-Driven Reactions in the Purple Photosynthetic Bacterium, Rhodospirillum Rubrum,
W73-11948 5C

Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

PHOXINUS-PHOXINUS
Population Biology of the Helminth Parasites of Phoxinus Phoxinus (L.) The Minnow, in a Cardiganshire Lake,
W73-11716 2H

PHYSICAL PROPERTIES
Studies of Cation Budgets in the Southern Appalachians on Four Experimental Watersheds with Contrasting Vegetation,
W73-11860 2E

PHYSICOCHEMICAL PROPERTIES
Behavior of the Silver, Silver Chloride Electrode in Concentrated Aqueous Sodium Chloride,
W73-12148 5A

PHYTO-PLANKTON
Seasonal Plankton Changes and Primary Productivity in Beech Reservoir,
W73-12169 2H

PHYTOPLANKTON
The Movement of Phosphorous in the Little River Estuary, New South Wales,
W73-11912 5B

A Dynamic Model of the Phytoplankton Population in the Sacramento-San Joaquin Delta,
W73-11937 5C

Influence of Dilution, Sinking and Grazing Rate on Phytoplankton Populations of Hyperfertilized Ponds and Microecosystems,
W73-11950 5C

PHYTOPLANKTON POPULATION MODEL
A Dynamic Model of the Phytoplankton Population in the Sacramento-San Joaquin Delta,
W73-11937 5C

PIEZODIALYSIS
Ionic Block Copolymers as Piezodialysis Membranes,
W73-11757 3A

PILOT VALLEY (UTAH AND NEV)
Hydrologic Reconnaissance of Pilot Valley, Utah and Nevada,
W73-12029 2F

PINK SALMON OVA
Fertilization of Pink Salmon (Oncorhynchus gorbuscha) Ova by Spermatozoa from Gonadotropin- injected Juveniles,
W73-11866 8I

PIPE FLOW
Resistance Losses in Noncircular Flood Control Conduits and Sluices,
W73-12027 8B

Hydraulic Network Analysis Using Linear Theory,
W73-12041 7C

PLANKTON
Plankton Diatom Species Biomasses and the Quality of American Rivers and the Great Lakes,
W73-11942 5C

Net Plankton and Nanoplankton Production and Biomass in a North Temperate Zone Lake,
W73-11951 5C

PLANNING
Development of a State Water-Planning Model, Part IV, Data Preparation,
W73-11708 6A

An Interactive Analysis of Natural Resource Allocation in a Contemporary Estuarine Ecosystem,
W73-11710 6B

Water Supply and Sewerage Planning in Central Merrimack Valley Region: Phase One.
W73-12043 5G

Water and Sewer Facility Plan for Adams County, Colorado.
W73-12044 6B

Study - Water and Sewer Facilities - Mobile County.
W73-12049 5D

Water Policies for the Future.
W73-12052 6B

A Proposal for a Model River Project Concerning 'Riverfront Beautification and Utilization in Metropolitan Areas.'
W73-12235 6B

Sewer and Water Utility Report,
W73-12236 5D

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. I.
W73-12269 4A

PLANT GROWTH
Drought Effects on a Semidesert Grassland Range,
W73-12247 2I

Nutrient Availability in Desert Grassland Soils Under Mesquite (Prosopis juliflora) Trees and Adjacent Open Areas,
W73-12250 2I

PLANT PHYSIOLOGY
Patterns of Water Movement in Trees and Shrubs,
W73-12246 2I

Ecology of Indian Desert. VIII: On the Water Relations and Assimilate Balance of some Desert Plants,
W73-12254 2I

Investigations of the Fate of Certain Pesticides Under Biotic and Abiotic Conditions Using Tracer Techniques,
W73-12261 5B

PLANT PIGMENTS
Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

The Effects of Ammonium and Phosphate Enrichments on Chlorophyll A, Pigment Ratio and Species Composition of Phytoplankton of Vineyard Sound,
W73-12116 5C

PLANT VIRUSES
Occurrence and Distribution of Cyanophages in Ponds, Sewage and Rice Fields,
W73-12126 5A

PLAQUE COUNTS
Experience with an Image-Analyzing Computer in Virus Plaque Measurements,
W73-12108 5A

PLECTONEMA BORYANUM
Occurrence and Distribution of Cyanophages in Ponds, Sewage and Rice Fields,
W73-12126 5A

PLOWSHARE PROGRAM. ENVIRONMENTAL IMPACT STATEMENTS
Environmental Statement, Rio Blanco Gas Stimulation Project, Rio Blanco County, Colorado.
W73-12258 5A

PLUTONIUM
The Determination of Plutonium-241 in Effluents,
W73-11819 5A

PODON POLYPHEMOIDES
Distribution of the Cladoceran Podon Polyphemoides in the Chesapeake Bay,
W73-12152 5A

POECILIA RETICULATA
Accumulation of Dieldrin in an Alga (Scenedesmus Obliquus), Daphnia Magna and the Guppy (Poecilia Reticulata),
W73-12098 5B

POLIOVIRUS
Virus in Water: II. Evaluation of Membrane Cartridge Filters for Recovering Low Multiplicities of Poliovirus from Water,
W73-12187 5F

POLITICAL ASPECTS
Management Science, Economics and Environmental Science,
W73-11867 6A

The Changing Decision Rules in the Politics of Water Development,
W73-12335 6E

POLLUTANT IDENTIFICATION
Distribution of Organics from Salmon Decomposition,
W73-11887 5B

Annotated Bibliography on 14-MEV Neutron Activation Analysis,
W73-11919 5A

Morphological, Biochemical, and Growth Characteristics of Pseudomonas cepacia from Distilled Water,
W73-12103 5A

Identification of Staphylococcus aureus by Simultaneous Use of Tube Coagulase and Thermonuclease Tests,
W73-12104 5A

Discrepancies in the Enumeration of Escherichia coli,
W73-12107 5A

Experience with an Image-Analyzing Computer in Virus Plaque Measurements,
W73-12108 5A

Specific Identification of Enteroviruses by Immuno-Electron Microscopy Using a Serum-In-Agar Diffusion Method,
W73-12109 5A

Delayed-Incubation Membrane-Filter Test for Fecal Coliforms,
W73-12120 5A

Feasibility of Remote Detection of Water Pollutants and Oil Slicks by Laser-Excited Raman Spectroscopy,
W73-12137 5A

Phenotypic Characterization of Beneckea Parahaemolytica: A Preliminary Report,
W73-12138 5A

Carbon Source Utilization Tests as an Aid to the Classification of Non-Fermenting Gram-Negative Bacteria,
W73-12140 5A

Vibrio Parahaemolyticus-Isolation, Identification, Classification, and Ecology,
W73-12144 5A

Report on Public Hearings on the Adoption of Proposed Regulations for the Purpose of Implementing the Water and Air Quality Reporting Act of 1971.
W73-12198 5G

POLLUTANTS
The Dose to Man via Food-Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-11851 5C

POLLUTION ABATEMENT
Manure Slurry Irrigation System Receiving Lot Runoff,
W73-11767 5D

Population and Pollution in the United States,
W73-11869 6A

Sewage Treatment System,
W73-11872 5D

Oil Skimming Apparatus,
W73-11873 5G

Apparatus and System for Removal of Latex from Waste Water,
W73-11874 5D

Skimming System,
W73-11876 5G

Waste Water Treatment System,
W73-11878 5D

Internal Precipitation of Phosphate in Settling Zone,
W73-11879 5D

Sewage Disposal Method,
W73-11880 5D

Oil Containment Boom,
W73-11882 5G

Method and Apparatus for Determining Oxygen Consumption Rate in Sewage,
W73-11883 5D

Liquid Filter,
W73-11884 5D

Submerged Filter-Horizontal Flow Mode,
W73-11885 5D

Method for Removing Oil and Debris from Water,
W73-11886 5G

Nitrogen Removal from Waste Water by Breakpoint Chlorination,
W73-11890 5D

Method of Removing Oil Spills from Water,
W73-11891 5G

Activated Sludge Sewage Treatment Process and System,
W73-11892 5D

Floating Debris Recovery Apparatus,
W73-11893 5G

Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

Method and Apparatus for Ecological Recycling of Waste Products to Produce Fertilizer and Garden Plant Nutrients,
W73-11895 5D

Liquid Filtering Apparatus,
W73-11898 5D

Water Pollution Control.
W73-12216 6E

POLLUTION SOURCES
Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

POLYETHYLENE GRAPHITE ELECTRODES
A Polythene Graphite Electrode for Voltammetry,
W73-12097 5A

POPULATION
Population and Pollution in the United States,
W73-11869 6A

Occurrence, Distribution and Density of Rangia Cuneata in Lakes Pontchartrain and Maurepas, Louisiana,
W73-11957 5C

PORE WATER
In Situ Sampler for Marine Sedimentary Pore Waters: Evidence for Potassium Depletion and Calcium Enrichment,
W73-11840 7B

Interstitial Water Composition in Barataria Bay (Louisiana) Sediment,
W73-12302 2L

PORT AUTHORITIES
Deep Draft Harbor and Terminal Authority.
W73-11994 6E

POTABLE WATER
A Bill to Assure the Public Is Provided with an Adequate Quantity of Safe Drinking Water.
W73-12199 6E

POTABLE WATERS
Safe Drinking Water.
W73-12205 5G

POTASSIUM
Effects of Irrigation and Fertilization on Yields and Chemical Composition of Corn and on the Changes in the Available K Contents of a Cecil Soil,
W73-12343 3F

POTENTIAL RESERVOIR SITES (ALABAMA)
Potential Reservoir Sites for Water Supply in Alabama, A Progress Report,
W73-12073 8B

POTOMAC ESTUARY
Potomac Estuary Wastewater Treatment Plants Survey.
W73-12076 5D

POTOMAC RIVER
Potomac Estuary Wastewater Treatment Plants Survey.
W73-12076 5D

Water Quality Survey of the Potomac Estuary Embayments and Transects.
W73-12077 5A

POUR PLATE METHOD
Discrepancies in the Enumeration of Escherichia coli,
W73-12107 5A

POWDER FLOW
The Ice-Dam, Powder-Flow Theory of Glacier Surge,
W73-11797 2C

POWER SYSTEM OPERATION
An Underground Storage Reservoir as an Artificial Structure,
W73-11741 8A

PRE-IMPOUNDMENT
Potential Reservoir Sites for Water Supply in Alabama, A Progress Report,
W73-12073 8B

PRECIPITATION
Stochastic Models for Precipitation,
W73-12287 2B

Uncertainties in Point and Areal Sampling of Precipitation and Their importance in Hydrologic Computations,
W73-12290 2B

Space-Time Uncertainties in Precipitation Measurement,
W73-12293 2B

PRECIPITATION (ATMOSPHERIC)
Design Characteristics of Storm Precipitation in the Carpathians (Raschetnyye kharakteristiki dozhdevykh osadkov v Karpatakh),
W73-11827 2B

Possibility of Using Storage Precipitation Gages to Improve the Accuracy of Precipitation Data in the Ukrainian Carpathians (O vozmozhnosti utochneniya kolichestva osadkov v Ukrainskikh Karpatakh po dannym summarnykh osadkomerov) ,
W73-11828 2B

A Precipitation-Based Forecast of Great Storm Floods on Mountain Tributaries of the Dniester (Prognoz vysokikh dozhdevykh pavodkov gornykh pritokov Dnestra po osadkam),
W73-11829 6B

Impact of Wetting on Microbial Respiration in Desert Soil,
W73-12257 2G

Precipitation Probabilities for Kentucky,
W73-12304 2B

PRECIPITATION PROBABILITIES (KY)
Precipitation Probabilities for Kentucky,
W73-12304 2B

PRECISION
Some Exact Tests of Hypotheses About Grubbs's Estimators,
W73-12112 5A

Comparison of the Precision of Normal and Precision Spectrophotometric Techniques,
W73-12143 5A

PREDATION
Predation, Natural Selection and Adaptation in an Unusual Threespine Stickleback,
W73-12178 2I

PRESSURIZED WATER REACTORS
Final Environmental Statement Related to Operation of Maine Yankee Atomic Power Station.
W73-11899 5C

Final Environmental Statement Related to Operation of Zion Nuclear Power Station Units 1 and 2.
W73-11900 5C

Final Environmental Statement Related to Operation of Surry Power Station Unit 2.
W73-11903 5C

Final Environmental Statement Related to Operation of Kewaunee Nuclear Power Plant.
W73-11904 5C

Final Environmental Statement Related to Operation of Fort Calhoun Station Unit 1.
W73-11906 5C

Final Environmental Statement Related to the Arkansas Nuclear One Unit 1.
W73-11913 5C

Final Environmental Statement Related to Construction of Davis-Besse Nuclear Power Station.
W73-11920 5C

Final Environmental Statement Related to Construction of Shearon Harris Nuclear Power Plant Units 1, 2, 3, and 4.
W73-11926 5C

Final Environmental Statement Related to the Proposed Crystal River Unit 3.
W73-11927 5C

Final Environmental Statement Related to Construction of Joseph M. Farley Nuclear Plant Units 1 and 2.
W73-11931 5C

PRIMARY PRODUCTIVITY
Net Plankton and Nanoplankton Production and Biomass in a North Temperate Zone Lake,
W73-11951 5C

Seasonal Plankton Changes and Primary Productivity in Beech Reservoir,
W73-12169 2H

PRIOR APPROPRIATION
Water Right Changes to Implement Water Management Technology,
W73-11969 6E

State Water Rights Laws,
W73-12007 6E

PROBABILITY
Determination of Suspended-Sediment Discharges of Various Probabilities on Rivers in the Ukraine (K opredeleniyu kharakteristik stoka vzveshennykh nanosov rek Ukrainy razlichnoy obespechennosti),
W73-11832 2J

Evaluation of Prediction Error Probabilities From Stochastic Models by Simulation,
W73-12275 4A

PROBABILITY LATTICE SAMPLING
Some Properties of Probability Lattice Sampling,
W73-12099 5A

PROFILES
Stream-Profile Analysis and Stream-Gradient Index,
W73-12064 2J

PROJECT REUSE
A Master Planning Methodology for Urban Drainage,
W73-12006 4A

PROPERTIES
Some Properties of Probability Lattice Sampling,
W73-12099 5A

PROTECTION (ELECTRICAL)
The Sparking of Lightning Arresters Due to Conductive Contaminants,
W73-11722 8C

PROTEINS
Feedlot Waste Utilized Efficiently by Animals.
W73-11762 5B

PROTEUS
Potential Pathogens in the Environment: Isolation, Enumeration, and Identification of Seven Genera of Intestinal Bacteria Associated with Small Green Pet Turtles,
W73-12150 5A

PSEUDOMONAS CEPACIA
Morphological, Biochemical, and Growth Characteristics of Pseudomonas cepacia from Distilled Water,
W73-12103 5A

PSEUDOMONAS PUTIDA
Metabolism of Phenol and Cresols by Mutants of Pseudomonas Putida,
W73-12139 5B

PUBLIC HEALTH
Solidification of Medium Activity Liquid Residues with Bitumen (Solidifiction Par Le Bitume De Residus Liquides De Moyenne Activite),
W73-11922 5D

Environmental Health (Construction Site Regulations).
W73-11985 6E

A Bill to Assure the Public Is Provided with an Adequate Quantity of Safe Drinking Water.
W73-12199 6E

Safe Drinking Water.
W73-12205 5G

Uptake of Mercury by Plants and its Distribution in Living Organisms in an Environment With Increased Concentration of This Element,
W73-12262 5C

Some Remarks on Mercury as an Aquatic Pollutant and its Implications,
W73-12263 5C

Significance of Mercury in the Environment: Suggestions for Further Research,
W73-12265 5C

PUBLIC RELATIONS
Research in the Development and Utilization of Atmospheric Water Resources in Montana,
W73-11712 3B

PUBLIC RIGHTS
Brickell V. Trammell (Title Suit to Determine Ownership of Submerged Lands Along Navigable Body of Water).
W73-11967 6E

Environmental Law--Expanding the Definition of Public Trust Uses,
W73-12211 6E

PUBLIC TRUST DOCTRINE
Environmental Law--Expanding the Definition of Public Trust Uses,
W73-12211 6E

PULP AND PAPER INDUSTRY
Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

PUMPED STORAGE
The Revin Pumped-Storage Plant,
W73-11726 8C

PUPFISH (RED RIVER)
Interspecific Interactions and Limiting Factors of Abundance and Distribution in the Red River Pupfish, Cyprinodon rubrofluviatilis,
W73-12181 2I

QU'APPELLE RIVER BASIN
Current Water Use Requirements in the Qu'Appelle River Basin,
W73-12232 6D

Report on Water Supply Study of Certain Urban Communities in the Qu'Appelle River Basin.
W73-12233 6D

RACEMIZATION
Kinetics of the Nonbiological Decomposition and Racemization of Amino Acids in Natural Waters,
W73-11938 2K

RACES
Milldams and Races.
W73-11992 6E

RADIAL GATES
The Hendrik Verwoerd Dam of the Orange River Project, South Africa.
W73-11740 8A

RADIO WAVES
The Effects of a Subarctic Glacier on Radio-Wave Propagation in Summer,
W73-11804 2C

RADIOACTIVE DATING
The Evaluation and Application of C-14 Dating of Groundwater,
W73-12297 2F

RADIOACTIVE WASTES
The Determination of Plutonium-241 in Effluents,
W73-11819 5A

RADIOACTIVITY
Environmental Monitoring Report for Sandia Laboratories from 1964 Through 1972,
W73-11908 5A

Environmental Surveillance at Hanford for CY-1972,
W73-11924 5A

RADIOACTIVITY TECHNIQUES
The Use of Radioactive Isotopes to Measure the Transfer of Materials in Aquatic Food Chains,
W73-12153 5A

RADIOCHEMICAL ANALYSIS
The Determination of Plutonium-241 in Effluents,
W73-11819 5A

RADIOECOLOGY
The Movement of Phosphorous in the Little River Estuary, New South Wales,
W73-11912 5B

RADIOISOTOPES
The Potential Radiological Implications of Nuclear Facilities in the Upper Mississippi River Basin in the Year 2000.
W73-11918 5B

Radiological Status of the Groundwater Beneath the Hanford Project - July-December, 1971,
W73-11923 5A

Environmental Surveillance at Hanford for CY-1972,
W73-11924 5A

Isotope Methods in Groundwater Science (Isotopenmethoden in Der Grundwasserkunde),
W73-11929 2F

RADIOMETER
Radiometer for Aquatic Use,
W73-12185 7B

RAILROAD BRIDGES
Deflections of Prestressed Concrete Bridges in Japan,
W73-11735 8F

RAIN
How Weather Affects Feedlot Performance.
W73-11772 5B

Observation on the Simulated Effects of Rain on Larva of Neodiprion Swainei (Hymenoptera, Diprionidae),
W73-12160 2I

RAIN GAGES
Space-Time Uncertainties in Precipitation Measurement,
W73-12293 2B

RAINBOW TROUT
Recovery of Planted Brook Trout, Splake, and Rainbow Trout from Selected Ontario Lakes,
W73-11940 8I

RAINFALL
Estimating Water Loss and Direct Runoff from Storm Rainfall by the Use of the Infiltrometer,
W73-11823 2E

Design Characteristics of Storm Precipitation in the Carpathians (Raschetnyye kharakteristiki dozhdevykh osadkov v Karpatakh),
W73-11827 2B

Time Lag Response in Boulder Clay Wells,
W73-11842 2F

Precipitation Probabilities for Kentucky,
W73-12304 2B

RAINFALL-RUNOFF RELATIONSHIPS
Formation and Computation of Components in a River Regime (Formirovaniye i raschety elementov rezhima rek).
W73-11825 2A

A Precipitation-Based Forecast of Great Storm Floods on Mountain Tributaries of the Dniester (Prognoz vysokikh dozhdevykh pavodkov gornykh pritokov Dnestra po osadkam),
W73-11829 6B

Hydrologic Changes After Clear-Cut Logging in a Small Oregon Coastal Watershed,
W73-12066 4C

Application of the Source-Area Concept of Storm Runoff to a Small Arizona Watershed,
W73-12067 2A

Hydrologic Forecasting With Sequential Deterministic and Stochastic Stages,
W73-12280 4A

Uncertainties in Estimating Runoff-Producing Rainfall for Thunderstorm Rainfall-Runoff Models,
W73-12282 2A

Variability of the Soil Water Flow Parameters and Their Effect on the Computation of Rainfall Excess and Runoff,
W73-12291 2G

RAINS COUNTY (TEX)
Ground-Water Resources of Rains and Van Zandt Counties, Texas,
W73-12031 2F

RANGIA CUNEATA
Occurrence, Distribution and Density of Rangia Cuneata in Lakes Pontchartrain and Maurepas, Louisiana,
W73-11957 5C

RAPID EXCAVATION
New Continuous-Flow Process for Blast-Hole Drilling in Hydraulic-Engineering, Reclamation, and Water-Resources Construction,
W73-11733 8H

REASONABLE USE
McMullen V. Ramsey Stock Farms, Inc. (Landowners Right to Drain Bottomlands or Non-Navigable Lake).
W73-12001 6E

RECLAIMED WATER
Water Reuse, A Bibliography, Volume 1.
W73-11701 5D

Water Reuse, A Bibliography, Volume 2.
W73-11702 5D

RECREATION
A Proposal for a Model River Project Concerning 'Riverfront Beautification and Utilization in Metropolitan Areas.'
W73-12235 6B

RECYCLING
The OPCCO Dryer.
W73-11771 5D

Feed Recycling Showing Promise.
W73-11782 5E

Feed 'Em Trash, Cut Pollution.
W73-11789 5D

RED RIVER
Red River Emergency Bank Protection, Louisiana, Arkansas, and Texas (Final Environmental Impact Statement).
W73-12196 4A

REFUSE ACT
The Federal Water Pollution Control Act Amendments of 1972: Effective Controls at Last,
W73-12214 5G

REFUSE-TIP LIQUOR
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

REGIMEN
Steele Glacier, 1935-1968,
W73-11791 2C

Movement Observations on the Terminus Area of the Steele Glacier, July 1967,
W73-11792 2C

Observations of the Surge of Steele Glacier,
W73-11796 2C

A Two-Year Mass-Balance Study of the Rusty Glacier, 1968-1969,
W73-11798 2C

REGIONAL ANALYSIS
A Master Planning Methodology for Urban Drainage,
W73-12006 4A

Urban Systems Engineering Demonstration Program. Volume IV: Area wide Storm Drainage and Flood Plain Management,
W73-12019 4C

REGIONAL DEVELOPMENT
Upper Trinity River Basin Comprehensive Sewerage Plan, Volume III, Management and Finance Program.
W73-12010 5D

A Water and Sewer Plan: Clarke County, Georgia.
W73-12013 5D

A Water and Sewer Plan: Barrow County, Georgia.
W73-12014 5D

Annual Report 1972.
W73-12240 6E

REGISTRATION
Registration is Required as Government Moves to Control Water Pollution from Large Feedlots,
W73-11786 5G

REGULATION
Pollution Crackdown.
W73-11785 5G

RELIABILITY
Reliability and Uncertainty in Predicting Transport Processes in Natural Streams and Rivers,
W73-12279 4A

REMOTE SENSING
The Effects of a Subarctic Glacier on Radio-Wave Propagation in Summer,
W73-11804 2C

Patterns of Surface Temperature in the Alpine/Periglacial Environment as Determined by Radiometric Measurements,
W73-11806 2C

Digital Telemetry--Functional Description and Specifications,
W73-11815 7B

Oil Spills: Measurements of Their Distributions and Volumes by Multifrequency Microwave Radiometry,
W73-11838 5A

Use of Satellite Imagery for Wildland Resource Evaluation In the Great Basin,
W73-12021 7B

The Use of ERTS-1 Imagery in the National Program for the Inspection of Dams,
W73-12028 7C

Natural Resource Information System, Volumes I and II.
W73-12040 6A

Microwave Signatures of First-Year and Multiyear Sea Ice,
W73-12081 7B

Feasibility of Remote Detection of Water Pollutants and Oil Slicks by Laser-Excited Raman Spectroscopy,
W73-12137 5A

Remote Sensing Study of Thermal Discharges to Lake Michigan, Wisconsin, Illionois, Indiana, and Michigan.
W73-12309 5B

REPRODUCIBILITY
Carbon Paste Electrode with a Wide Anodic Potential Range,
W73-12142 5A

RESERVOIR DESIGN
Investigation of Mudflows in the Cheremosh River Basin in Connection with Design of the Rostoki Reservoir (Issledovaniye seley v basseyne r. Cheremosh v svyazi s proyektirovaniyem Rostokinskogo vodokhranilishcha),
W73-11831 2J

RESERVOIR SITES
Potential Reservoir Sites for Water Supply in Alabama, A Progress Report,
W73-12073 8B

RESERVOIRS
Investigation of Mudflows in the Cheremosh River Basin in Connection with Design of the Rostoki Reservoir (Issledovaniye seley v basseyne r. Cheremosh v svyazi s proyektirovaniyem Rostokinskogo vodokhranilishcha),
W73-11831 2J

The Use of ERTS-1 Imagery in the National Program for the Inspection of Dams,
W73-12028 7C

Annual Compilation and Analysis of Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1971,
W73-12038 2E

Absorption of Solar Radiation by Melting Ice Cover on Rivers and Reservoirs (K voprosu o pogloshchenii solnechnoy radiatsii tayushchim ledyanym pokrovom rek i vodokhranilishch),
W73-12058 2C

RESIDUALS MANAGEMENT
Management Science, Economics and Environmental Science,
W73-11867 6A

RESINS
Continuous Ion Exchange Softening,
W73-12189 5F

RESOURCE ALLOCATION
An Interactive Analysis of Natural Resource Allocation in a Contemporary Estuarine Ecosystem,
W73-11710 6B

REVERSE OSMOSIS
Water Reuse, A Bibliography, Volume 1.
W73-11701 5D

Final Disposal of Effluent Brines from Inland Desalting Plants,
W73-11749 5E

Search for New Desalination Membranes,
W73-11753 3A

Differential Scanning Calorimetry of Cellulose Acetate,
W73-11755 3A

Monomolecular Film Properties of Cellulose and Amylose Triacetates at the Air-Water Interface,
W73-11756 3A

Diffusion of Sodium Chloride in Cellulose and Amylose Acetates,
W73-11758 3A

Water Vapor Sorption in Cellulose and Amylose Acetates,
W73-11760 3A

Reverse Osmosis Studies of Cellulose and Amylose Acetates,
W73-11761 3A

Poly (N-Amido)Imides as Semipermeable Membranes,
W73-12036 3A

Desalting in the Arid Regions,
W73-12244 3A

RHEOLOGY
The Ice-Dam, Powder-Flow Theory of Glacier Surge,
W73-11797 2C

Attenuation of Swell by Sea Ice,
W73-12082 2C

RHODAMINE WT
Tests of Rhodamine WT Dye for Toxicity to Oysters and Fish,
W73-12068 5C

RHODE ISLAND
Rhode Island Marine Bibliography.
W73-12316 2L

RHODE ISLAND SOUND
Disposition of Spoil on the Dump Site,
W73-12318 5E

Sediments of the Dredging and Disposal Areas,
W73-12319 5E

Characteristics of the Physical Environment,
W73-12320 5E

RHODOSPIRILLUM RUBRUM
Evidence for Two Light-Driven Reactions in the Purple Photosynthetic Bacterium, Rhodospirillum Rubrum,
W73-11948 5C

RICE
Crayfish Farming in the United States,
W73-11848 6D

RIP CURRENTS
Nearshore Currents and the Equilibrium Cuspate Shoreline,
W73-12075 2J

RIPARIAN RIGHTS
Brickell V. Trammell (Title Suit to Determine Ownership of Submerged Lands Along Navigable Body of Water).
W73-11967 6E

RISK
Reduction of Uncertainties in Autocorrelation by the Use of Physical Models,
W73-12283 2A

RISKS
International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. I.
W73-12269 4A

Environmental Control Systems: Treatment of Uncertainty in Models and Data,
W73-12271 6A

Technological Uncertainty in the Economic Evaluation of New Water Resources,
W73-12273 6A

Bias, Illusion, and Denial as Data Uncertainties,
W73-12278 7C

Reliability and Uncertainty in Predicting Transport Processes in Natural Streams and Rivers,
W73-12279 4A

Uncertainties in Estimating Runoff-Producing Rainfall for Thunderstorm Rainfall-Runoff Models,
W73-12282 2A

Streamflow Frequency Using Stochastically Generated Hourly Rainfall,
W73-12284 2E

Physical Assumptions and Their Consequences on Modelling Groundwater Movement,
W73-12288 4B

Uncertainties in Point and Areal Sampling of Precipitation and Their importance in Hydrologic Computations,
W73-12290 2B

Space-Time Uncertainties in Precipitation Measurement,
W73-12293 2B

Information Transfer Via Regression in Markovian Worlds,
W73-12294 6A

RIVER BASIN COMMISSIONS
Sabine River Authority.
W73-11975 6E

Little Calumet River Basin Commission.
W73-11983 6E

Great Lakes River Basins Commission.
W73-11984 6E

Little Calumet River Basin Commission.
W73-11983 6E

Great Lakes River Basins Commission.
W73-11984 6E

Upper Mississippi Riverway Compact.
W73-11989 6E

Annual Report 1972.
W73-12240 6E

RIVER BASINS
Investigation of Mudflows in the Cheremosh River Basin in Connection with Design of the Rostoki Reservoir (Issledovaniye seley v basseyne r. Cheremosh v svyazi s proyektirovaniyem Rostokinskogo vodokhranilishcha),
W73-11831 2J

Analysis of Streamflow Forecasting Uncertainty,
W73-12277 4A

RIVER FLOW
Evaluation of Seasonal Time-Series Models: Applications to Mid-West River Flow Data,
W73-12272 7C

RIVER SYSTEMS
Designating Rock Creek in Montana as Part of the Wild and Scenic Rivers System.
W73-12207 6E

RIVERFRONT BEAUTIFICATION
A Proposal for a Model River Project Concerning 'Riverfront Beautification and Utilization in Metropolitan Areas.'
W73-12235 6B

RIVERS
Formation and Computation of Components in a River Regime (Formirovaniye i raschety elementov rezhima rek).
W73-11825 2A

Maximum Flood Discharges and Depths of Runoff on Carpathian Rivers (Maksimal'nyye raskhody i sloi pavodochnogo stoka rek Karpat),
W73-11826 2E

Determination of Suspended-Sediment Discharges of Various Probabilities on Rivers in the Ukraine (K opredeleniyu kharakteristik stoka vzveshennykh nanosov rek Ukrainy razlichnoy obespechennosti),
W73-11832 2J

Natural Regulation of Runoff on Rivers in the Northwestern Ukraine (Yestestvennaya zaregulirovannost'stoka rek severo-zapada Ukrainy),
W73-11833 2E

A Quantitative Relationship Between Surface and Subsurface Components in the Total Flood Discharge of Rivers in Western and Central Podolia (O kolichestvennom sootnoshenii mezhdu podzemnoy i poverkhnostnoy sostavlyayushchimi v sum marnom stoke pavodkov na primere rek Zapadnoy i Tsentral'noy Podolii),
W73-11834 2A

Simulation of Hydrologic and Chemical-Quality Variations in an Irrigated Stream-Aquifer System--A Preliminary Report,
W73-12024 2A

Investigation of Effect of Soil Freezing Depth and Other Factors on Snowmelt Runoff on Rivers in Steppe and Forest-Steppe Zones (Issledovaniye vliyaniya glubiny promerzaniya pochvy i drugikh faktorov na talyy stok rek stepnoy i l esostepnoy zon),
W73-12055 2E

Absorption of Solar Radiation by Melting Ice Cover on Rivers and Reservoirs (K voprosu o pogloshchenii solnechnoy radiatsii tayushchim ledyanym pokrovom rek i vodokhranilishch),
W73-12058 2C

Radionuclides in River Systems,
W73-12259 5B

Seasonal Regime and Hydrological Significance of Stream Icings in Central Alaska,
W73-12314 2C

RIVERS AND HARBORS ACT
The Federal Water Pollution Control Act Amendments of 1972: Effective Controls at Last,
W73-12214 5G

ROAD CONSTRUCTION
Drains and Watercourses Affecting Highways.
W73-12223 6E

ROADBANKS
Erosion Prevention During Highway Construction by the Use of Sprayed on Chemicals,
W73-11855 5G

Development of Dwarf Ground Cover for Erosion Control in Colorado,
W73-12071 4D

ROCK CREEK
Designating Rock Creek in Montana as Part of the Wild and Scenic Rivers System.
W73-12207 6E

ROCK FOUNDATIONS
Coupled Stress and Flow Analysis of Fractured Dam Foundations and Rock Slopes,
W73-11730 8E

ROCK WEATHERING
Studies of Saprolite and Its Relation to the Migration and Occurrence of Groundwater in Crystalline Rocks,
W73-11706 2G

ROLLOVER FISH PASS (TEX)
A Field Investigation of Rollover Fish Pass, Bolivar Penninsula, Texas,
W73-11854 8B

ROOT GROWTH
Soil Physical Conditions Affecting Seedling Root Growth: II. Mechanical Impedance, Aeration and Moisture Availability as Influenced by Grain-Size Distribution and Moisture Content in Silica Sands,
W73-12163 2I

ROOTED AQUATIC PLANTS
Sites of Nutrient Absorption in Aquatic Macrophytes,
W73-12134 5C

ROSTOKI RESERVOIR
Investigation of Mudflows in the Cheremosh River Basin in Connection with Design of the Rostoki Reservoir (Issledovaniye seley v basseyne r. Cheremosh v svyazi s proyektirovaniyem Rostokinskogo vodokhranilishcha),
W73-11831 2J

ROTATING RING-HEMISPHERICAL ELECTRODE
A Rotating Ring-Hemispherical Electrode for Electroanalytical Applications,
W73-12096 5A

ROTENONE
Exposure Times Necessary for Antimycin and Rotenone to Eliminate Certain Freshwater Fish,
W73-11961 5C

ROUGHNESS (HYDRAULIC)
Resistance Losses in Noncircular Flood Control Conduits and Sluices,
W73-12027 8B

RUNOFF
Maximum Flood Discharges and Depths of Runoff on Carpathian Rivers (Maksimal'nyye raskhody i sloi pavodochnogo stoka rek Karpat),
W73-11826 2E

Natural Regulation of Runoff on Rivers in the Northwestern Ukraine (Yestestvennaya zaregulirovannost'stoka rek severo-zapada Ukrainy),
W73-11833 2E

Investigation of Effect of Soil Freezing Depth and Other Factors on Snowmelt Runoff on Rivers in Steppe and Forest-Steppe Zones (Issledovaniye vliyaniya glubiny promerzaniya pochvy i drugikh faktorov na talyy stok rek stepnoy i l esostepnoy zon),
W73-12055 2E

Patterns of Stream-Discharge Variability (Zakonomernosti v izmenenii modulya stoka),
W73-12056 2E

Analysis of Streamflow Forecasting Uncertainty,
W73-12277 4A

RUNOFF FORECASTING
Forecasting Runoff From Universal Surface Gage Snowmelt Measurements,
W73-11853 2C

RUSSEL-SPOFFORD MODEL
Management Science, Economics and Environmental Science,
W73-11867 6A

RUSTY GLACIER (CANADA)
A Two-Year Mass-Balance Study of the Rusty Glacier, 1968-1969,
W73-11798 2C

Hydrological Study of the Rusty Glacier,
W73-11799 2C

Gravity and Shallow-Ice Temperature Measurements on the Rusty Glacier,
W73-11800 2C

Thermal Drilling and Ice-Temperature Measurements in the Rusty Glacier,
W73-11801 2C

SAFE DRINKING WATER ACT OF 1973
A Bill to Assure the Public Is Provided with an Adequate Quantity of Safe Drinking Water.
W73-12199 6E

SAFE YIELD
Judicial-Oriented Institutional Solutions: San Gabriel Valley Experience,
W73-12009 4B

SAGEBRUSH
A Lovely New Scent for Manure.
W73-11783 5D

SALINE SOILS
Field Studies on Salt Leaching in a Highly Saline Sodic Soil,
W73-11835 2G

Soil Changes Caused by Erosion Control Treatments on a Salt Desert Area,
W73-12249 2G

SALINE WATER INTRUSION
The Effects of Plugging a Deep Artesian Well on the Concentration of Chloride in Water in the Water-Table Aquifer at Highland Estates, Lee County, Florida,
W73-12039 2F

SALINITY
Distribution of the Cladoceran Podon Polyphemoides in the Chesapeake Bay,
W73-12152 5A

SALMON
Distribution of Organics from Salmon Decomposition,
W73-11887 5B

SALMONELLA
Potential Pathogens in the Environment: Isolation, Enumeration, and Identification of Seven Genera of Intestinal Bacteria Associated with Small Green Pet Turtles,
W73-12150 5A

SALMONELLA WELTEVREDEN
Typing of Salmonella Weltevreden Strains by Means of Lysis Patterns of Symbiotic Phages,
W73-12121 5A

SALT REJECTION
Reverse Osmosis Studies of Cellulose and Amylose Acetates,
W73-11761 3A

SALT TOLERANCE
Soil Changes Caused by Erosion Control Treatments on a Salt Desert Area,
W73-12249 2G

SAMPLE DATA
A Unified Method for the Reconstruction of Sampled Data,
W73-12147 5A

SAMPLE SIZE
Bayesian Acceptance-Sampling Schemes for Two-Sided Tests of the Mean of a Normal Distribution of Known Variance,
W73-12101 5A

SAMPLING
In Situ Sampler for Marine Sedimentary Pore Waters: Evidence for Potassium Depletion and Calcium Enrichment,
W73-11840 7B

Graphs, Tables and Discussion to Aid in the Design and Evaluation of an Acceptable Sampling Procedure Based on Cumulative Sums,
W73-12111 5A

Uncertainties in Point and Areal Sampling of Precipitation and Their importance in Hydrologic Computations,
W73-12290 2B

SAN DIMAS EXPERIMENTAL FOREST
Uncertainties in Point and Areal Sampling of Precipitation and Their importance in Hydrologic Computations,
W73-12290 2B

SAN FRANCISCO BAY REGION (CALIF)
Current Slope-Stability Studies in the San Francisco Bay Region,
W73-12065 2J

SAN JOAQUIN DRAINAGE BASIN (CALIF)
Analysis of Streamflow Forecasting Uncertainty,
W73-12277 4A

SAND AND GRAVEL RESOURCES (S DAK)
Major Aquifers and Sand and Gravel Resources in Day County, South Dakota,
W73-11847 2F

SANDS
Major Aquifers and Sand and Gravel Resources in Day County, South Dakota,
W73-11847 2F

Groundwater Recharge Through the Zone of Aeration in a Sandy Desert (Pitaniye gruntovykh vod peschanoy pustyni cherz zonu aeratsii),
W73-12061 2F

Nearshore Currents and the Equilibrium Cuspate Shoreline,
W73-12075 2J

SANDSTONES
Hydrologic Significance of Lithofacies of the Cane River Formation or Equivalents of Arkansas, Louisiana, Mississippi, and Texas,
W73-12053 2F

SATELLITES (ARTIFICIAL)
Use of Satellite Imagery for Wildland Resource Evaluation In the Great Basin,
W73-12021 7B

The Use of ERTS-1 Imagery in the National Program for the Inspection of Dams,
W73-12028 7C

SCALING
Scale Inhibition by Organic Electrodeposition,
W73-11751 8G

SCENEDESMUS OBLIQUUS
Accumulation of Dieldrin in an Alga (Scenedesmus Obliquus), Daphnia Magna and the Guppy (Poecilia Reticulata),
W73-12098 5B

SCIOTO RIVER (OHIO)
Butomus Umbellatus in the Mississippi Watershed,
W73-12176 2I

SEA ICE
Oil and Ice in the Arctic Ocean: Possible Large-Scale Interactions,
W73-11839 5B

Microwave Signatures of First-Year and Multiyear Sea Ice,
W73-12081 7B

Attenuation of Swell by Sea Ice,
W73-12082 2C

Eddy Correlation Measurements of Evaporation and Sensible Heat Flux Over Arctic Sea Ice,
W73-12083 2D

SEA LAMPREYS (METAMORPHOSED)
An Evaluation of Selected Marks and Tags for Marking Recently Metamorphosed Sea Lampreys,
W73-12251 2H

SEA URCHINS
The Effects of Chlorination of Wastewater on Fertilization in Some Marine Invertebrates,
W73-12117 5C

SEA WATER
Salts in the Sea,
W73-11812 2K

Hydrology of the Pacific Ocean (Gidrologiya Tikhogo okeana).
W73-12063 2L

Magnesium to Chlorinity Ratios in Seawater,
W73-12086 2K

SEALING
Dairy Waste Ponds Effectively Self-Sealing,
W73-11764 5B

SEASONAL
A Seasonal Study of the Vegetation on Levees,
W73-12166 2I

Evaluation of Seasonal Time-Series Models: Applications to Mid-West River Flow Data,
W73-12272 7C

SEASONAL REPRODUCTION
Distribution of the Cladoceran Podon Polyphemoides in the Chesapeake Bay,
W73-12152 5A

SEAWEED MANURE
Seaweeds as Manure III. Field Manurial Trials on Pennisetum Typhoids S. H. (Pearl Millet) and Arachis Hypogea (Groundnut),
W73-11941 5C

SEDIMENT CONTROL
Soil Conservation.
W73-12002 6E

SEDIMENT DISCHARGE
Determination of Suspended-Sediment Discharges of Various Probabilities on Rivers in the Ukraine (K opredeleniyu kharakteristik stoka vzveshennykh nanosov rek Ukrainy razlichnoy obespechennosti),
W73-11832 2J

SEDIMENT DISTRIBUTION
Sediment Distribution in Southwestern Delaware Bay,
W73-12308 2L

Sediments of the Dredging and Disposal Areas,
W73-12319 5E

Characteristics of the Physical Environment,
W73-12320 5E

SEDIMENT LOAD
Some Aspects of the Geomorphology of Meltwater Streams, Steele Glacier Terminus,
W73-11794 2C

SEDIMENT TRANSPORT
Movement Observations on the Terminus Area of the Steele Glacier, July 1967,
W73-11792 2C

Observations on an Alpine Mudflow, Steele Creek,
W73-11795 2C

The Meandering of Alluvial Rivers,
W73-11844 2J

Coarse-Grained Sedimentation on a Braided Outwash Fan, Northeast Gulf of Alaska,
W73-12307 2L

SEDIMENTARY STRUCTURE
Comparison of Moraines Formed by Surging and Normal Glaciers,
W73-11793 2C

SEDIMENTARY STRUCTURES
Bed Forms of the Mediterranean Undercurrent Observed With Side-Scan Sonar,
W73-12300 2L

Coarse-Grained Sedimentation on a Braided Outwash Fan, Northeast Gulf of Alaska,
W73-12307 2L

SEDIMENTATION
The Sedimentology of a Braided River,
W73-11808 2J

Phosphate in Sediments Off South-Western Africa,
W73-11811 2J

Waste Water Treatment System,
W73-11878 5D

Submerged Filter-Horizontal Flow Mode,
W73-11885 5D

SEDIMENTATION RATES
Soil Changes Caused by Erosion Control Treatments on a Salt Desert Area,
W73-12249 2G

SEDIMENTOLOGY
Sediment Distribution in Southwestern Delaware Bay,
W73-12308 2L

SEDIMENTS
Determination of the Diffusion Coefficient of Radioelements in the Rhone Sediments,
W73-11921 5B

Sediment Distribution in Southwestern Delaware Bay,
W73-12308 2L

SEEPAGE
Coupled Stress and Flow Analysis of Fractured Dam Foundations and Rock Slopes,
W73-11730 8E

SEICHES
Some Kinetic Energy Spectra in a Nearshore Region of Lake Ontario,
W73-12084 2E

SEISMIC DESIGN
Mechanisms of Energy Absorption in Speical Devises for Use in Earthquake Resistant Structures,
W73-11725 8A

SEMIPERMEABLE MEMBRANES
Poly (N-Amido)Imides as Semipermeable Membranes,
W73-12036 3A

SEPARATION TECHNIQUES
Deoxyribonucleic Acid Base Composition and Taxonomic Position of Glucose Fermenting Marine Bacteria of the Genus Vibrio and Related Genera, (Composition en Bases de L'Adn et Position Taxonomique de Bacteries Marines Fermentant le Glucose, du Genre Vibrio et des Genres Voisins),
W73-12090 5A

Identification of Staphylococcus aureus by Simultaneous Use of Tube Coagulase and Thermonuclease Tests,
W73-12104 5A

Effect of Acetate Upon the Formation of Acetoin in Klebsiella and Enterobacter and its Possible Practical Application in a Rapid Voges-Proskauer Test,
W73-12106 5A

Characterization of Thiobacillus Species by Gas-Liquid Chromatography of Cellular Fatty Acids,
W73-12127 5A

SERRATIA
Potential Pathogens in the Environment: Isolation, Enumeration, and Identification of Seven Genera of Intestinal Bacteria Associated with Small Green Pet Turtles,
W73-12150 5A

SERUM-IN-AGAR DIFFUSION METHOD
Specific Identification of Enteroviruses by Immuno-Electron Microscopy Using a Serum-In-Agar Diffusion Method,
W73-12109 5A

SERVOMECHANICS
The Effect of Valve Area Gain on the Performance of the Hydraulic Servomechanism,
W73-11723 8C

SEVERN ESTUARY (ENGLAND)
The Distribution of Dissolved Mercury in the Bristol Channel and Severn Estuary,
W73-12301 5B

SEWAGE
Sewer and Water Utility Report,
W73-12236 5D

SEWAGE DISPOSAL
Environmental Health (Construction Site Regulations).
W73-11985 6E

Recycling Sludge and Sewage Effluent by Land Disposal.
W73-12334 5D

SEWAGE EFFLUENTS
Effect of Diversion of Domestic Waste Waters on Phosphorus Content and Eutrophication of the Madison Lakes,
W73-11946 5C

SEWAGE EFFLUENTS

Recycling Sludge and Sewage Effluent by Land Disposal.
W73-12334 5D

SEWAGE PURIFICATION
Aspects of the Biology of the Lumbricids Eiseniella Tetraedra (Savigny) and Dendrobaena Rubida (Savigny) F. Subrubicunda (Eisen) in a Percolating Filter,
W73-12175 5C

SEWAGE SLUDGE
Recycling Sludge and Sewage Effluent by Land Disposal.
W73-12334 5D

SEWAGE TREATMENT
Water Reuse, A Bibliography, Volume 1.
W73-11701 5D

Water Reuse, A Bibliography, Volume 2.
W73-11702 5D

Sewage Treatment System,
W73-11872 5D

Internal Precipitation of Phosphate in Settling Zone,
W73-11879 5D

Method and Apparatus for Determining Oxygen Consumption Rate in Sewage,
W73-11883 5D

Nitrogen Removal from Waste Water by Breakpoint Chlorination,
W73-11890 5D

Activated Sludge Sewage Treatment Process and System,
W73-11892 5D

Domestic Sewage Treatment Plant,
W73-11897 5D

SEWERAGE
Upper Trinity River Basin Comprehensive Sewerage Plan, Volume III, Management and Finance Program.
W73-12010 5D

Engineering Report on Mason Street and Milbank Avenue Drainage and Drainage Systems, Greenwich, Connecticut.
W73-12011 8A

A Water and Sewer Plan: Clarke County, Georgia.
W73-12013 5D

A Water and Sewer Plan: Barrow County, Georgia.
W73-12014 5D

Urban Systems Engineering Demonstration Program. Volume I: Goals, Objectives, and Standards for Waterworks, Sanitary Sewerage, Solid Waste Management, Storm Drainage and Flood Plain Management,
W73-12016 5D

Urban Systems Engineering Demonstration Program. Volume II: Areawide Water and Sanitary Sewerage Systems,
W73-12017 5D

Water Supply and Sewerage Planning in Central Merrimack Valley Region: Phase One.
W73-12043 5G

Water and Sewer Facility Plan for Adams County, Colorado.
W73-12044 6B

Study - Water and Sewer Facilities - Mobile County.
W73-12049 5D

Sewerage Systems Report: Somerset County, N.J.
W73-12237 5D

SEWERS
Metropolitan Water Intelligence Systems - Completion Report, Phase II,
W73-11704 5G

Inventory and Analysis of Existing Water and Sewer Systems and Long Range Water and Sewer Plans, Natchez, Mississippi,
W73-12015 6D

Urban Systems Engineering Demonstration Program. Volume I: Goals, Objectives, and Standards for Waterworks, Sanitary Sewerage, Solid Waste Management, Storm Drainage and Flood Plain Management,
W73-12016 5D

Urban Systems Engineering Demonstration Program. Volume II: Areawide Water and Sanitary Sewerage Systems,
W73-12017 5D

SEXUAL MATURATION
Fertilization of Pink Salmon (Oncorhynchus gorbuscha) Ova by Spermatozoa from Gonadotropin- injected Juveniles,
W73-11866 8I

SHEEPSCOT RIVER ESTUARY
Final Environmental Statement Related to Operation of Maine Yankee Atomic Power Station.
W73-11899 5C

SHELLFISH
A Study of the Marine Resources of the Waquoit Bay-Eel Pond Estuary,
W73-12173 2L

SHELLFISH FARMING
Coastal Plains Regional Commission--Annual Report, 1972.
W73-11974 6E

SHORES
Currents in the Shore Zone of a Nontidal Sea (Techeniya beregovoy zony besprilivnogo morya),
W73-12060 2H

SIEVE ANALYSIS
Methods for Sampling and Determining Sieve Analysis of Aggregates Larger Than One and One-Half Inch Sieve,
W73-12070 8F

SILICATES
Silicon and the Ecology of Marine Plankton Diatoms. II. Silicate-Uptake Kinetics in Five Diatom Species,
W73-11863 5B

Silicon and the Ecology of Marine Plankton Diatoms. I. Thalassiosira pseudonana (Cyclotella nana) Grown in a Chemostat with Silicate as Limiting Nutrient,
W73-12119 5C

SILVER CHLORIDE
Behavior of the Silver, Silver Chloride Electrode in Concentrated Aqueous Sodium Chloride,
W73-12148 5A

SIMILITUDE
Centrifuge Testing for Models of Soil Structures,
W73-11745 8D

SIMULATION
Observation on the Simulated Effects of Rain on Larva of Neodiprion Swainei (Hymenoptera, Diprionidae),
W73-12160 2I

SIMULATION ANALYSIS
International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. I.
W73-12269 4A

Methods for Assessing Variability, With Emphasis on Simulation Data Interpretations,
W73-12274 7C

Evaluation of Prediction Error Probabilities From Stochastic Models by Simulation,
W73-12275 4A

Reliability and Uncertainty in Predicting Transport Processes in Natural Streams and Rivers,
W73-12279 4A

Hydrologic Forecasting With Sequential Deterministic and Stochastic Stages,
W73-12280 4A

Effect of Length of Records of Monthly Flows on the First Serial Correlation Coefficient,
W73-12285 2E

A General Model for Vertical Thermal Stratification in Ice Free Lakes,
W73-12326 2H

SITES
Final Environmental Statement Related to Operation of Maine Yankee Atomic Power Station.
W73-11899 5C

Final Environmental Statement Related to Operation of Zion Nuclear Power Station Units 1 and 2.
W73-11900 5C

Final Environmental Statement Related to Operation of Surry Power Station Unit 2.
W73-11903 5C

Final Environmental Statement Related to Operation of Kewaunee Nuclear Power Plant.
W73-11904 5C

Final Environmental Statement Related to Operation of Fort Calhoun Station Unit 1.
W73-11906 5C

Final Environmental Statement Related to the Arkansas Nuclear One Unit 1.
W73-11913 5C

Final Environmental Statement Related to the Proposed Hanford Number Two Nuclear Power Plant.
W73-11917 5C

Final Environmental Statement Related to Construction of Davis-Besse Nuclear Power Station.
W73-11920 5C

Final Environmental Statement Related to Construction of Shearon Harris Nuclear Power Plant Units 1, 2, 3, and 4.
W73-11926 5C

Final Environmental Statement Related to the Proposed Crystal River Unit 3.
W73-11927 5C

Final Environmental Statement Related to Operation of Pilgrim Nuclear Power Station.
W73-11928 5C

Final Environmental Statement Related to Construction of Joseph M. Farley Nuclear Plant Units 1 and 2.
W73-11931 5C

Final Environmental Statement Related to Operation of Vermont Yankee Nuclear Power Station.
W73-11932 5C

Environmental Statement, Rio Blanco Gas Stimulation Project, Rio Blanco County, Colorado.
W73-12258 5A

SLIME
Resistance to Coliphage Infection Induced in Escherichia coli by Growth in the Presence of a Surfactant,
W73-12105 5C

SLOPE STABILITY
Current Slope-Stability Studies in the San Francisco Bay Region,
W73-12065 2J

SLUDGE DISPOSAL
Recycling Sludge and Sewage Effluent by Land Disposal.
W73-12334 5D

SLURRIES
Manure Slurry Irrigation System Receiving Lot Runoff,
W73-11767 5D

SMOLT COUNTER
A Simple Electronic Smolt Counter,
W73-12332 8I

SNAILS (SALT MARSH)
Distribution of the Salt Marsh Snail (Melampus Bidentatus Say) in Relation to Marsh Plants in the Poropotank River Area, Virginia,
W73-12164 2L

SNOW COVER
At Institutes of the Hydrometeorological Service (V uchrezhdeniyakh Gidrometsluzhby),
W73-12059 2C

SNOWFALL
Snow Accumulation in the Icefield Ranges, St. Elias Mountains,
W73-11803 2C

SNOWMELT
Forecasting Runoff From Universal Surface Gage Snowmelt Measurements,
W73-11853 2C

Investigation of Effect of Soil Freezing Depth and Other Factors on Snowmelt Runoff on Rivers in Steppe and Forest-Steppe Zones (Issledovaniye vliyaniya glubiny promerzaniya pochvy i drugikh faktorov na talyy stok rek stepnoy i l esostepnoy zon),
W73-12055 2E

SNOWPACKS
Snow Accumulation in the Icefield Ranges, St. Elias Mountains,
W73-11803 2C

At Institutes of the Hydrometeorological Service (V uchrezhdeniyakh Gidrometsluzhby),
W73-12059 2C

SOCKEYE SALMON FRY
Observations on the Migration of Sockeye Salmon Fry (Oncorhynchus Nerka) in the Lower Babine River,
W73-11747 8I

SODIUM
Effect of Exchangeable Sodium on Hydraulic Conductivity of Soil,
W73-11849 2G

SODIUM CHLORIDE
Behavior of the Silver, Silver Chloride Electrode in Concentrated Aqueous Sodium Chloride,
W73-12148 5A

SODIUM SILICATE
Basic Relationships Affecting the Planning of Single-Phase Chemical Ground Stabilization,
W73-11729 8G

SOIL BACTERIA
Location and Consequences of 1,1,1-Trichloro-2,2-Bis (P-Chlorophenyl) Ethane Uptake by Bacillus Megaterium,
W73-12091 5B

SOIL CONSERVATION
Flood and Erosion Control.
W73-11978 6E

Soil Conservation and Flood Control Districts.
W73-11979 6E

Soil Conservation.
W73-12002 6E

SOIL CONTAMINATION
Environmental Monitoring Report for Sandia Laboratories from 1964 Through 1972,
W73-11908 5A

The Potential Radiological Implications of Nuclear Facilities in the Upper Mississippi River Basin in the Year 2000.
W73-11918 5B

Environmental Surveillance at Hanford for CY-1972,
W73-11924 5A

SOIL FORMATION
Ionic Migration and Weathering in Frozen Antarctic Soils,
W73-11836 2K

The Prediction of Soil Occurrence in Certain Desert Regions of the Southwestern United States,
W73-12256 2G

SOIL GASES
Impact of Wetting on Microbial Respiration in Desert Soil,
W73-12257 2G

SOIL INVESTIGATIONS
Soil Changes Caused by Erosion Control Treatments on a Salt Desert Area,
W73-12249 2G

Nutrient Availability in Desert Grassland Soils Under Mesquite (Prosopis juliflora) Trees and Adjacent Open Areas,
W73-12250 2I

The Prediction of Soil Occurrence in Certain Desert Regions of the Southwestern United States,
W73-12256 2G

Impact of Wetting on Microbial Respiration in Desert Soil,
W73-12257 2G

SOIL MOISTURE METERS
Depth Intervals and Topsoil Moisture Measurement with the Neutron Depth Probe,
W73-11841 2G

SOIL PHYSICAL PROPERTIES
Soil Physical Conditions Affecting Seedling Root Growth: II. Mechanical Impedance, Aeration and Moisture Availability as Influenced by Grain-Size Distribution and Moisture Content in Silica Sands,
W73-12163 2I

SOIL PROPERTIES
Soil Water,
W73-12171 2G

Impact of Wetting on Microbial Respiration in Desert Soil,
W73-12257 2G

SOIL STABILIZATION
Basic Relationships Affecting the Planning of Single-Phase Chemical Ground Stabilization,
W73-11729 8G

SOIL WATER
Soil Water,
W73-12171 2G

Water-Stress Patterns in Honey Mesquite,
W73-12252 2I

Variability of the Soil Water Flow Parameters and Their Effect on the Computation of Rainfall Excess and Runoff,
W73-12291 2G

SOIL WATER MOVEMENT
Steady Upward and Downward Flows in a Class of Unsaturated Soils,
W73-11824 2G

Forest Soils and the Associated Soil-Plant Water Regime,
W73-11933 2I

An Infiltration Model Tested with Monolith Moisture Measurements,
W73-12087 2J

Soil Changes Caused by Erosion Control Treatments on a Salt Desert Area,
W73-12249 2G

SOIL-WATER-PLANT RELATIONSHIPS
Forest Soils and the Associated Soil-Plant Water Regime,
W73-11933 2I

Ecology of Indian Desert. VIII: On the Water Relations and Assimilate Balance of some Desert Plants,
W73-12254 2I

SOILS
Investigation of Effect of Soil Freezing Depth and Other Factors on Snowmelt Runoff on Rivers in Steppe and Forest-Steppe Zones (Issledovaniye vliyaniya glubiny promerzaniya pochvy i drugikh faktorov na talyy stok rek stepnoy i l esostepnoy zon),
W73-12055 2E

Matric Suctions to Which Soils in South Central England Drain,
W73-12172 2G

SOLAR RADIATION
Absorption of Solar Radiation by Melting Ice Cover on Rivers and Reservoirs (K voprosu o pogloshchenii solnechnoy radiatsii tayushchim ledyanym pokrovom rek i vodokhranilishch),
W73-12058 2C

On the Photodecomposition of Chlorophyll in Vitro,
W73-12146 5C

SOLID WASTES
Solid Waste Management for Cattle Feedlots,
W73-11766 5D

Urban Systems Engineering Demonstration Program. Volume I: Goals, Objectives, and Standards for Waterworks, Sanitary Sewerage, Solid Waste Management, Storm Drainage and Flood Plain Management,
W73-12016 5D

Urban Systems Engineering Demonstration Program. Volume III: Areawide Solid Waste Management,
W73-12018 5E

The Technology of Solid Waste Management--Implications for State Policy.
W73-12193 5G

SOLIDS REMOVAL SYSTEMS
Beef Cattle Feedlot Runoff, Solids Transport and Settling Characteristics,
W73-11774 5D

SOLIFLUCTION
Up-Heaved Blocks: A Curious Feature of Instability in the Tundra,
W73-11807 2C

Vegetation, Microtopography, and Depth of Active Layer on Different Exposures in Subarctic Alpine Tundra,
W73-11809 2J

SOLUTE CONCENTRATION
Behavior of the Silver, Silver Chloride Electrode in Concentrated Aqueous Sodium Chloride,
W73-12148 5A

SOLUTE TRANSPORT
Cation Transport in Soils and Factors Affecting Soil Carbonate Solubility,
W73-11714 5B

SOMERSET COUNTY (NEW JERSEY)
Sewerage Systems Report: Somerset County, N.J.
W73-12237 5D

SORPTION
Water Vapor Sorption in Cellulose and Amylose Acetates,
W73-11760 3A

SOUNDS
Disposition of Spoil on the Dump Site,
W73-12318 5E

Sediments of the Dredging and Disposal Areas,
W73-12319 5E

Characteristics of the Physical Environment,
W73-12320 5E

SOUTH CAROLINA
Horse Range Swamp Watershed Project, Orangeburg County, South Carolina (Final Environmental Impact Statement).
W73-12201 4D

Little River Inlet North Carolina and South Carolina--Navigation (Final Environmental Impact Statement).
W73-12202 4A

SOUTH DAKOTA
Major Aquifers and Sand and Gravel Resources in Day County, South Dakota,
W73-11847 2F

SOUTH PLATTE RIVER VALLEY (COLO)
Hydrogeologic Characteristics of the Valley-Fill Aquifer in the Julesburg Reach of the South Platte River Valley, Colorado,
W73-12296 2F

SOUTHERN CALIFORNIA
Judicial-Oriented Institutional Solutions: San Gabriel Valley Experience,
W73-12009 4B

SOUTHFIELD (MICH)
Flood Plain Report - City of Southfield.
W73-12045 4A

SOUTHWEST US
The Prediction of Soil Occurrence in Certain Desert Regions of the Southwestern United States,
W73-12256 2G

SPACE-TIME
Space-Time Uncertainties in Precipitation Measurement,
W73-12293 2B

SPALLING
Conditions for Instability in Restrained Concrete Panels Exposed to Fire,
W73-11739 8F

SPATIAL DISTRIBUTION
Abundance and Diversity of Mollusca in an Industrialized Portion of the Ottawa River Near Ottawa-Hull, Canada,
W73-11862 5C

SPECIES DENSITY
Abundance and Diversity of Mollusca in an Industrialized Portion of the Ottawa River Near Ottawa-Hull, Canada,
W73-11862 5C

SPECIES DIVERSITY
Abundance and Diversity of Mollusca in an Industrialized Portion of the Ottawa River Near Ottawa-Hull, Canada,
W73-11862 5C

SPECTROPHOTOMETRY
Comparison of the Precision of Normal and Precision Spectrophotometric Techniques,
W73-12143 5A

SPECTRORADIOMETER
A Submersible Spectroradiometer and Data Acquisition System,
W73-12135 5A

SPLAKE
Recovery of Planted Brook Trout, Splake, and Rainbow Trout from Selected Ontario Lakes,
W73-11940 8I

SPRAY ZONES (FALLS)
Studies of the Spray Zone of Churchill Falls, Labrador,
W73-12162 2I

SPRINKLER IRRIGATION
Soil Moisture Extraction and Irrigation Design Requirements for Corn,
W73-11727 3F

Side Roll Sprinklers,
W73-11737 3F

Farming Circles,
W73-11738 3F

ST. CLAIR COUNTY (ILL)
Geology for Planning in St. Clair County, Illinois.
W73-12069 2F

ST. ELIAS MOUNTAINS (CANADA)
Abundances of Isotopic Species of Water in the St. Elias Mountains,
W73-11802 2C

Snow Accumulation in the Icefield Ranges, St. Elias Mountains,
W73-11803 2C

ST. JOHNS RIVER (FLA)
Flow and Chemical Characteristics of the St. Johns River at Jacksonville, Florida,
W73-12030 2L

ST. LAWRENCE RIVER
Numerical Model Studies of the St. Lawrence River,
W73-12313 2L

ST. LOUIS (MO)
Shoaling Conditions, St. Louis Harbor, Mississippi River,
W73-11856 8B

STANDING CROPS
Abundance and Diversity of Mollusca in an Industrialized Portion of the Ottawa River Near Ottawa-Hull, Canada,
W73-11862 5C

STAPHYLOCOCCUS AUREUS
Identification of Staphylococcus aureus by Simultaneous Use of Tube Coagulase and Thermonuclease Tests,
W73-12104 5A

STATE AGENCIES
Water Publications of State Agencies. A Bibliography of Publication on Water Resources and Their Management Published by the States of the USA.
W73-12161 10C

STATE JURISDICTION
Drainage under State Laws (Minnesota and Arkansas).
W73-11966 6E

Felton V. Hodges (State's Authority to Regulate Commercial Fishing Beyond Its Territorial Waters).
W73-12200 6E

STATE POLICY
Environmental Policy.
W73-12228 6E

STATIONARY-EMBEDDED PROCESSES
Tests of Stationarity of Hydrologic Time Series,
W73-12286 2A

STATISTICAL METHODS
On Double Sampling for Stratification and Analytical Surveys,
W73-12092 5A

An Evaluation of Ten Pairwise Multiple Comparison Procedures by Monte Carlo Methods,
W73-12100 5A

Bayesian Acceptance-Sampling Schemes for Two-Sided Tests of the Mean of a Normal Distribution of Known Variance,
W73-12101 5A

Graphs, Tables and Discussion to Aid in the Design and Evaluation of an Acceptable Sampling Procedure Based on Cumulative Sums,
W73-12111 5A

Some Exact Tests of Hypotheses About Grubbs's Estimators,
W73-12112 5A

Stochastic Stream Temperature Model,
W73-12289 4A

STATISTICS
Statistics of Ocean Wave Groups,
W73-11817 2E

STEADY FLOW
Steady Upward and Downward Flows in a Class of Unsaturated Soils,
W73-11824 2G

STEELE CREEK (CANADA)
Observations on an Alpine Mudflow, Steele Creek,
W73-11795 2C

STEELE GLACIER (CANADA)
Steele Glacier, 1935-1968,
W73-11791 2C

Movement Observations on the Terminus Area of the Steele Glacier, July 1967,
W73-11792 2C

Some Aspects of the Geomorphology of Meltwater Streams, Steele Glacier Terminus,
W73-11794 2C

Observations of the Surge of Steele Glacier,
W73-11796 2C

STEELHEAD TROUT
Fertilization of Steelhead Trout (Salmo Gairdneri) Eggs with Cryo-Preserved Sperm,
W73-12129 8I

Habitat Selection and Spatial Interaction by Juvenile Chinook Salmon and Steelhead Trout in Two Idaho Streams,
W73-12245 2I

STEMFLOW
Patterns of Water Movement in Trees and Shrubs,
W73-12246 2I

STICKLEBACK
Morphology, Life History, and Ecology of an Unusual Stickleback (Gasterosteus Aculeatus) in the Queen Charlotte Islands, Canada,
W73-12177 2I

STICKLEBACK (THREESPINE)
Predation, Natural Selection and Adaptation in an Unusual Threespine Stickleback,
W73-12178 2I

STOCHASTIC PROCESSES
International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. I.
W73-12269 4A

Evaluation of Seasonal Time-Series Models: Applications to Mid-West River Flow Data,
W73-12272 7C

Methods for Assessing Variability, With Emphasis on Simulation Data Interpretations,
W73-12274 7C

Evaluation of Prediction Error Probabilities From Stochastic Models by Simulation,
W73-12275 4A

Flood Evaluation - Can Stochastic Models Provide an Answer,
W73-12276 7C

Bias, Illusion, and Denial as Data Uncertainties,
W73-12278 7C

Reliability and Uncertainty in Predicting Transport Processes in Natural Streams and Rivers,
W73-12279 4A

Hydrologic Forecasting With Sequential Deterministic and Stochastic Stages,
W73-12280 4A

Uncertainties in Estimating Runoff-Producing Rainfall for Thunderstorm Rainfall-Runoff Models,
W73-12282 2A

Streamflow Frequency Using Stochastically Generated Hourly Rainfall,
W73-12284 2E

Tests of Stationarity of Hydrologic Time Series,
W73-12286 2A

Stochastic Models for Precipitation,
W73-12287 2B

Stochastic Stream Temperature Model,
W73-12289 4A

Information Transfer Via Regression in Markovian Worlds,
W73-12294 6A

STONEFLIES
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

STORAGE
Solid Waste Management for Cattle Feedlots,
W73-11766 5D

STORM DRAINS
Engineering Report on Mason Street and Milbank Avenue Drainage and Drainage Systems, Greenwich, Connecticut.
W73-12011 8A

STORM PRECIPITATION
Design Characteristics of Storm Precipitation in the Carpathians (Raschetnyye kharakteristiki dozhdevykh osadkov v Karpatakh),
W73-11827 2B

STORM RUNOFF
Metropolitan Water Intelligence Systems - Completion Report, Phase II,
W73-11704 5G

Estimating Water Loss and Direct Runoff from Storm Rainfall by the Use of the Infiltrometer,
W73-11823 2E

Formation and Computation of Components in a River Regime (Formirovaniye i raschety elementov rezhima rek).
W73-11825 2A

A Precipitation-Based Forecast of Great Storm Floods on Mountain Tributaries of the Dniester (Prognoz vysokikh dozhdevykh pavodkov gornykh pritokov Dnestra po osadkam),
W73-11829 6B

Application of the Source-Area Concept of Storm Runoff to a Small Arizona Watershed,
W73-12067 2A

STORMS
The Significance of Time-Dependent Transports in Storm-Generated Coastal Currents,
W73-11816 2J

Estimating Water Loss and Direct Runoff from Storm Rainfall by the Use of the Infiltrometer,
W73-11823 2E

Design Characteristics of Storm Precipitation in the Carpathians (Raschetnyye kharakteristiki dozhdevykh osadkov v Karpatakh),
W73-11827 2B

A Precipitation-Based Forecast of Great Storm Floods on Mountain Tributaries of the Dniester (Prognoz vysokikh dozhdevykh pavodkov gornykh pritokov Dnestra po osadkam),
W73-11829 6B

A Comprehensive Analysis of a Major Storm and Associated Flooding in Arizona,
W73-12242 2B

Stochastic Models for Precipitation,
W73-12287 2B

STRAW TRANSFORMATION
The Transformation of Nitrogen and Carbon in the Soil During Humification of Straw Labelled with N15,
W73-12342 2G

STREAM GAGES
Measurements of Currents,
W73-11850 2E

STREAM-GRADIENT INDEX
Stream-Profile Analysis and Stream-Gradient Index,
W73-12064 2J

STREAMFLOW
Summary Report on The Upper Bear Creek Experimental Project.
W73-12026 2A

Annual Compilation and Analysis of Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1971,
W73-12038 2E

Bias, Illusion, and Denial as Data Uncertainties,
W73-12278 7C

Reduction of Uncertainties in Autocorrelation by the Use of Physical Models,
W73-12283 2A

Streamflow Frequency Using Stochastically Generated Hourly Rainfall,
W73-12284 2E

STREAMFLOW

Effect of Length of Records of Monthly Flows on the First Serial Correlation Coefficient,
W73-12285 2E

STREAMFLOW FORECASTING
Analysis of Streamflow Forecasting Uncertainty,
W73-12277 4A

Stochastic Stream Temperature Model,
W73-12289 4A

STREAMS
A Plan for the Construction and Testing of Water Pollution Forecasting Models,
W73-12281 5B

Seasonal Regime and Hydrological Significance of Stream Icings in Central Alaska,
W73-12314 2C

STRESS ANALYSIS
Three-Dimensional Behavior of a Central Core Dam,
W73-11822 8A

STRICT LIABILITY
Ozark Industries, Inc. V. Stubbs Transports, Inc. (Action to Recover Fishkill Damages when Gasoline from Overturned Truck Found its Way into Springfed Trout Pool).
W73-12197 6E

SUBMERGED PLANTS
Sites of Nutrient Absorption in Aquatic Macrophytes,
W73-12134 5C

SUBMERSIBLE LIGHT METER
A Submersible Spectroradiometer and Data Acquisition System,
W73-12135 5A

SUBSTRATE UTILIZATION
Silicon and the Ecology of Marine Plankton Diatoms. II. Silicate-Uptake Kinetics in Five Diatom Species,
W73-11863 5B

Carbon Source Utilization Tests as an Aid to the Classification of Non-Fermenting Gram-Negative Bacteria,
W73-12140 5A

SUBSURFACE RUNOFF
A Quantitative Relationship Between Surface and Subsurface Components in the Total Flood Discharge of Rivers in Western and Central Podolia (O kolichestvennom sootnoshenii mezhdu podzemnoy i poverkhnostnoy sostavlyayushchimi v sum marnom stoke pavodkov na primere rek Zapadnoy i Tsentral'noy Podolii),
W73-11834 2A

SUCCESSION
Drought Effects on a Semidesert Grassland Range,
W73-12247 2I

SUGAR BEETS
The Effect of Plant Population and Irrigation on Sugar Beet,
W73-12348 3F

SULFATES
Titration of Sulphate in Mineral Waters and Sea Water by Using the Solid-State Lead Electrode,
W73-11818 2K

SULPHATED POLYSACCHARIDES
Correlated Light and Electron Microscope Studies on Brown Algae. I. Localization of Alginic Acid and Sulphated Polysaccharides in Dictyota,
W73-11939 5C

SUNFISH (GREEN)
Potentials of the Redear Sunfish x Green Sunfish Hybrid in Pond Management,
W73-12253 8I

SUNFISH (REDREAR)
Potentials of the Redear Sunfish x Green Sunfish Hybrid in Pond Management,
W73-12253 8I

SUPRAGLACIAL STREAMS
Supraglacial Streams of the Kaskawulsh Glacier,
W73-11805 2C

SURFACE DRAINAGE
Drainage Law in North Dakota: An Overview,
W73-12215 6E

SURFACE-GROUNDWATER RELATIONSHIPS
Formation and Computation of Components in a River Regime (Formirovaniye i raschety elementov rezhima rek).
W73-11825 2A

A Quantitative Relationship Between Surface and Subsurface Components in the Total Flood Discharge of Rivers in Western and Central Podolia (O kolichestvennom sootnoshenii mezhdu podzemnoy i poverkhnostnoy sostavlyayushchimi v sum marnom stoke pavodkov na primere rek Zapadnoy i Tsentral'noy Podolii),
W73-11834 2A

SURFACE PRESSURE
Monomolecular Film Properties of Cellulose and Amylose Triacetates at the Air-Water Interface,
W73-11756 3A

SURFACE RUNOFF
A Quantitative Relationship Between Surface and Subsurface Components in the Total Flood Discharge of Rivers in Western and Central Podolia (O kolichestvennom sootnoshenii mezhdu podzemnoy i poverkhnostnoy sostavlyayushchimi v sum marnom stoke pavodkov na primere rek Zapadnoy i Tsentral'noy Podolii),
W73-11834 2A

SURFACE WATERS
Hydrologic Data: 1971, Volume V: Southern California.
W73-11846 2E

Water for Alabama--Identification of Objectives,
W73-12315 6B

SURFACES
The Influence of Surfaces on the Structure of Water,
W73-11754 1B

Damping the Energy of Surface Waves by Turbulence (Gasheniye energii poverkhnostnykh voln turbulentnost'yu),
W73-12057 1A

SURFACTANTS
Resistance to Coliphage Infection Induced in Escherichia coli by Growth in the Presence of a Surfactant,
W73-12105 5C

Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

SURGING GLACIERS
Steele Glacier, 1935-1968,
W73-11791 2C

Movement Observations on the Terminus Area of the Steele Glacier, July 1967,
W73-11792 2C

Observations of the Surge of Steele Glacier,
W73-11796 2C

The Ice-Dam, Powder-Flow Theory of Glacier Surge,
W73-11797 2C

A Two-Year Mass-Balance Study of the Rusty Glacier, 1968-1969,
W73-11798 2C

Hydrological Study of the Rusty Glacier,
W73-11799 2C

Gravity and Shallow-Ice Temperature Measurements on the Rusty Glacier,
W73-11800 2C

Thermal Drilling and Ice-Temperature Measurements in the Rusty Glacier,
W73-11801 2C

Abundances of Isotopic Species of Water in the St. Elias Mountains,
W73-11802 2C

SURVEY
Environmental Surveillance at Hanford for CY-1972,
W73-11924 5A

SURVIVAL
Partial Characterization of Mycobacteriophage R1 Particles Surviving Chloroform Treatment,
W73-12124 5A

SUSPENDED LOAD
Some Aspects of the Geomorphology of Meltwater Streams, Steele Glacier Terminus,
W73-11794 2C

SUSPENDED SOLIDS
Determination of Suspended-Sediment Discharges of Various Probabilities on Rivers in the Ukraine (K opredeleniyu kharakteristik stoka vzveshennykh nanosov rek Ukrainy razlichnoy obespechennosti),
W73-11832 2J

SUSQUEHANNA RIVER
The Design of Optimal Precipitation Measuring Networks for Flood Forecasting,
W73-12292 2B

SYNTHETIC HYDROLOGY
Bias, Illusion, and Denial as Data Uncertainties,
W73-12278 7C

SYSTEMATICS
Fungi of the Chesapeake Bay and its Tributaries II. The Genus Conioscypha,
W73-11861 5A

Deoxyribonucleic Acid Base Composition and Taxonomic Position of Glucose Fermenting Marine Bacteria of the Genus Vibrio and Related Genera, (Composition en Bases de L'Adn et Position Taxonomique de Bacteries Marines Fermentant le Glucose, du Genre Vibrio et des Genres Voisins),
W73-12090 5A

The Taxonomic Position of Obesumbacterium Proteus, a Common Brewery Contaminant,
W73-12149 5A

A New Species of Baetis (Ephemeroptera) From Ponds in the Canadian Arctic, with Biological Notes,
W73-12157 5A

SYSTEMS ANALYSIS
Systems Analysis of the Great Lakes,
W73-11703 4A

Implications of a Systems Approach to Oceanography,
W73-11868 6A

A Master Planning Methodology for Urban Drainage,
W73-12006 4A

A Unified Method for the Reconstruction of Sampled Data,
W73-12147 5A

SYSTEMS ENGINEERING
International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. I.
W73-12269 4A

TAGS (FLOY ANCHOR)
Effects of the Floy Anchor Tag on the Growth and Survival of Brook Trout (Salvelinus fontinalis),
W73-12336 8I

TARRANT COUNTY (TEX)
Annual Compilation and Analysis of Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1971,
W73-12038 2E

TELEMETRY
Digital Telemetry--Functional Description and Specifications,
W73-11815 7B

Automatic Meter Reading Using Existing Telephone Circuits,
W73-12145 5A

TELEPHONE CIRCUITS
Automatic Meter Reading Using Existing Telephone Circuits,
W73-12145 5A

TEMPERATURE
Gravity and Shallow-Ice Temperature Measurements on the Rusty Glacier,
W73-11800 2C

Thermal Drilling and Ice-Temperature Measurements in the Rusty Glacier,
W73-11801 2C

Patterns of Surface Temperature in the Alpine/Periglacial Environment as Determined by Radiometric Measurements,
W73-11806 2C

Thermal Regime of Freezing Bodies of Water (Termika zamerzayushchikh vodoyemov),
W73-11858 2C

Analysis of Streamflow Forecasting Uncertainty,
W73-12277 4A

TENNESSEE
Radionuclides in River Systems,
W73-12259 5B

TENNESSEE (BEECH RESERVOIR)
Seasonal Plankton Changes and Primary Productivity in Beech Reservoir,
W73-12169 2H

TERATOGENICITY
Effect of Zinc on Growth and Development of Larvae of the Pacific Oyster Crassostrea gigas,
W73-12118 5C

TERRAIN ANALYSIS
Stream-Profile Analysis and Stream-Gradient Index,
W73-12064 2J

TERTIARY TREATMENT
Water Reuse, A Bibliography, Volume 1.
W73-11701 5D

Water Reuse, A Bibliography, Volume 2.
W73-11702 5D

Domestic Sewage Treatment Plant,
W73-11897 5D

TEXAS
A Field Investigation of Rollover Fish Pass, Bolivar Penninsula, Texas,
W73-11854 8B

Water-Budget Studies of Lower Mesilla Valley and El Paso Valley, El Paso County, Texas.,
W73-12022 2A

Ground-Water Resources of Rains and Van Zandt Counties, Texas,
W73-12031 2F

Ground-Water Resources of Wheeler and Eastern Gray Counties, Texas,
W73-12032 2F

Annual Compilation and Analysis of Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1971,
W73-12038 2E

Fish Species Diversity in Relation to Stream Order and Physicochemical Conditions in the Plum Creek Drainage Basin,
W73-12167 2I

Aquatic Plant Control and Eradication Program, State of Texas (Final Environmental Statement).
W73-12203 4A

Oil and Gas--Rights of Mineral Lessee in Use of Surface Owner's Fresh Water for Secondary Recovery Purposes, Sun Oil V. Whitaker.
W73-12212 6E

TEXTILES
Anaerobic-Aerobic Treatment of Textile Wastes with Activated Carbon,
W73-11715 5D

THAILAND
Effect of Length of Records of Monthly Flows on the First Serial Correlation Coefficient,
W73-12285 2E

THALASSIOSIRA PSEUDONANA
Silicon and the Ecology of Marine Plankton Diatoms. I. Thalassiosira pseudonana (Cyclotella nana) Grown in a Chemostat with Silicate as Limiting Nutrient,
W73-12119 5C

THALLIUM
Distribution of Mercury, Cadmium, Lead and Thallium in a Eutrophic Lake,
W73-11707 5B

THERMAL POLLUTION
National Accelerator Laboratory, Batavia, Illinois. (Environmental Statement).
W73-11902 5C

Remote Sensing Study of Thermal Discharges to Lake Michigan, Wisconsin, Illionois, Indiana, and Michigan.
W73-12309 5B

THERMAL POWERPLANTS
Cooling Towers and Water Quality,
W73-12155 5C

THERMAL SPALLING
Conditions for Instability in Restrained Concrete Panels Exposed to Fire,
W73-11739 8F

THERMAL STRESS
Conditions for Instability in Restrained Concrete Panels Exposed to Fire,
W73-11739 8F

Studies on Factors Affecting Survival of Nile Fish in the Sudan. II. The Effect of Temperature,
W73-12132 5C

THERMODYNAMIC BEHAVIOR
Behavior of the Silver, Silver Chloride Electrode in Concentrated Aqueous Sodium Chloride,
W73-12148 5A

THERMODYNAMICS
The Influence of Surfaces on the Structure of Water,
W73-11754 1B

THIAMINE
Isolation of New Methanol-Utilizing Bacteria and its Thiamine-Requirement for Growth,
W73-12122 5A

THIOBACILLUS SSP
Characterization of Thiobacillus Species by Gas-Liquid Chromatography of Cellular Fatty Acids,
W73-12127 5A

THUNDERSTORMS
A Comprehensive Analysis of a Major Storm and Associated Flooding in Arizona,
W73-12242 2B

Uncertainties in Estimating Runoff-Producing Rainfall for Thunderstorm Rainfall-Runoff Models,
W73-12282 2A

TIDAL EFFECTS
Numerical Model Studies of the St. Lawrence River,
W73-12313 2L

TIDAL MARSHES
The Great Marsh, Lewes, Delaware--The Physiography, Classification and Geologic History of a Coastal Marsh,
W73-12033 2L

TIDAL STREAMS
Numerical Model Studies of the St. Lawrence River,
W73-12313 2L

TILAPIA NILOTICA
Studies on Factors Affecting Survival of Nile Fish in the Sudan. I. The Effect of Hydrogen Ion Concentration,
W73-12131 5C

Studies on Factors Affecting Survival of Nile Fish in the Sudan. II. The Effect of Temperature,
W73-12132 5C

Studies on Factors Affecting Survival of Nile Fish in the Sudan. III. The Effect of Oxygen,
W73-12133 5C

TILL
Time Lag Response in Boulder Clay Wells,
W73-11842 2F

TIME LAG
Time Lag Response in Boulder Clay Wells,
W73-11842 2F

TIME SERIES ANALYSIS
Tests of Stationarity of Hydrologic Time Series,
W73-12286 2A

TOLERANCE LEVELS
Waste-Caused Air Pollutants are Measured in Swine Buildings,
W73-11778 5A

TOLL BRIDGES
Watercourses--Canals--Toll Bridges,
W73-12221 6E

TOTAL ORGANIC CARBON
Anaerobic-Aerobic Treatment of Textile Wastes with Activated Carbon,
W73-11715 5D

TOUGHNESS
Procedures for Evaluation of Fracture Toughness of Heat-Affected Zones,
W73-11721 8G

TOXICITY
Tests of Rhodamine WT Dye for Toxicity to Oysters and Fish,
W73-12068 5C

The Toxicity of Heavy Metals to Embryos of the American Oyster Crassostrea virginica,
W73-12113 5C

Toxicity Studies on the Components of an Oil-Spill Emulsifier Using Lichina pygmaea and Xanthoria parietina,
W73-12115 5C

Toxicity of Lead Nitrate to Five Species of Freshwater Algae,
W73-12322 5C

TRACERS
Ionic Migration and Weathering in Frozen Antarctic Soils,
W73-11836 2K

Forest Soils and the Associated Soil-Plant Water Regime,
W73-11933 2I

TRACTIVE FORCES
Criteria for Stable Earth Channel Design,
W73-11746 8B

TRANSFER
The Use of Radioactive Isotopes to Measure the Transfer of Materials in Aquatic Food Chains,
W73-12153 5A

TRANSIENT FLOW
An Underground Storage Reservoir as an Artificial Structure,
W73-11741 8A

TRANSPORT
Turnover and Vertical Transport of Zinc by the Euphausiid Meganyctiphanes norvegica in the Ligurian Sea,
W73-12114 5B

TRANSPORT PROCESSES
Reliability and Uncertainty in Predicting Transport Processes in Natural Streams and Rivers,
W73-12279 4A

TREATIES
The Seabed Arms Control Treaty: A Study in the Contemporary Law of the Military Uses of the Seas,
W73-11965 6E

Civil Liability for Oil Pollution,
W73-12213 5G

TRITIUM
The Dose to Man via Food-Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-11851 5C

Some Features of the Impact of a Fusion Reactor Power Plant on the Environment,
W73-11910 5B

An Investigation of Tritium Decontamination,
W73-11925 5D

Forest Soils and the Associated Soil-Plant Water Regime,
W73-11933 2I

TROUT SPERM (CRYO-PERSERVED)
Fertilization of Steelhead Trout (Salmo Gairdneri) Eggs with Cryo-Preserved Sperm,
W73-12129 8I

TUCSON BASIN
Impact of Wetting on Microbial Respiration in Desert Soil,
W73-12257 2G

TUNDRA
Up-Heaved Blocks: A Curious Feature of Instability in the Tundra,
W73-11807 2C

Vegetation, Microtopography, and Depth of Active Layer on Different Exposures in Subarctic Alpine Tundra,
W73-11809 2J

TUNNEL CONSTRUCTION
Shield Tunnelling With Liner Plates,
W73-11732 8A

An Approach to Underground Construction,
W73-11744 8A

TUNNEL SUPPORTS
A Survey of Large Permanent Underground Openings in Norway,
W73-11724 8E

Shield Tunnelling With Liner Plates,
W73-11732 8A

TUNNELS
The Hendrik Verwoerd Dam of the Orange River Project, South Africa.
W73-11740 8A

TURBELLARIA
The Effects of Refuse-Tip Liquor Upon Stream Biology,
W73-11859 5C

TURBULENCE
Damping the Energy of Surface Waves by Turbulence (Gasheniye energii poverkhnostnykh voln turbulentnost'yu),
W73-12057 1A

Some Kinetic Energy Spectra in a Nearshore Region of Lake Ontario,
W73-12084 2E

U.S. AGENCIES
Environmental Research Laboratories in the Federal Government--An Inventory, Volumes I and II,
W73-11845 9C

UKRAINE
Formation and Computation of Components in a River Regime (Formirovaniye i raschety elementov rezhima rek).
W73-11825 2A

Possibility of Using Storage Precipitation Gages to Improve the Accuracy of Precipitation Data in the Ukrainian Carpathians (O vozmozhnosti utochneniya kolichestva osadkov v Ukrainskikh Karpatakh po dannym summarnykh osadkomerov) ,
W73-11828 2B

A Precipitation-Based Forecast of Great Storm Floods on Mountain Tributaries of the Dniester (Prognoz vysokikh dozhdevykh pavodkov gornykh pritokov Dnestra po osadkam),
W73-11829 6B

Role of Natural and Anthropogenic Factors in Mudflow Formation in the Ukrainian Carpathians (O roli prirodnykh i antropogennykh faktorov v seleobrazovanii v Ukrainskikh Karpatakh),
W73-11830 2J

Determination of Suspended-Sediment Discharges of Various Probabilities on Rivers in the Ukraine (K opredeleniyu kharakteristik stoka vzveshennykh nanosov rek Ukrainy razlichnoy obespechennosti),
W73-11832 2J

Natural Regulation of Runoff on Rivers in the Northwestern Ukraine (Yestestvennaya zaregulirovannost'stoka rek severo-zapada Ukrainy),
W73-11833 2E

A Quantitative Relationship Between Surface and Subsurface Components in the Total Flood Discharge of Rivers in Western and Central Podolia (O kolichestvennom sootnoshenii mezhdu podzemnoy i poverkhnostnoy sostavlyayushchimi v sum marnom stoke pavodkov na primere rek Zapadnoy i Tsentral'noy Podolii),
W73-11834 2A

ULTIMATE DISPOSAL
Final Disposal of Effluent Brines from Inland Desalting Plants,
W73-11749 5E

Solid Waste Management for Cattle Feedlots,
W73-11766 5D

UNDERGROUND
Environmental Statement, Rio Blanco Gas Stimulation Project, Rio Blanco County, Colorado.
W73-12258 5A

UNDERGROUND OPENINGS
A Survey of Large Permanent Underground Openings in Norway,
W73-11724 8E

UNDERGROUND POWERPLANTS
A Survey of Large Permanent Underground Openings in Norway,
W73-11724 8E

The Revin Pumped-Storage Plant,
W73-11726 8C

UNDERGROUND STRUCTURES
A Survey of Large Permanent Underground Openings in Norway,
W73-11724 8E

UNDERGROUND WATER STORAGE
An Underground Storage Reservoir as an Artificial Structure,
W73-11741 8A

UNITED NATIONS
The Seabed Arms Control Treaty: A Study in the Contemporary Law of the Military Uses of the Seas,
W73-11965 6E

UNITED STATES
Drainage under State Laws (Minnesota and Arkansas).
W73-11966 6E

(A Bill to be Entitled: The Oil Pollution Compensation Act of 1973).
W73-12191 6E

A Bill to Assure the Public Is Provided with an Adequate Quantity of Safe Drinking Water.
W73-12199 6E

Citizens for Clean Air, Inc. V. Corps of Engineers, U.S. Army (Public Hearing Not Required Under the NEPA).
W73-12209 6E

Save Our Ten Acres V. Kreger (Standard of Judicial Review of Agency Action Under Nepa).
W73-12218 6E

US-USSR Expertise Exchange,
W73-12255 6E

Environmental Guide for the U.S. Gulf Coast,
W73-12310 6G

UNSATURATED FLOW
Steady Upward and Downward Flows in a Class of Unsaturated Soils,
W73-11824 2G

URBAN DRAINAGE
A Master Planning Methodology for Urban Drainage,
W73-12006 4A

Engineering Report on Mason Street and Milbank Avenue Drainage and Drainage Systems, Greenwich, Connecticut.
W73-12011 8A

Urban Systems Engineering Demonstration Program. Volume I: Goals, Objectives, and Standards for Waterworks, Sanitary Sewerage, Solid Waste Management, Storm Drainage and Flood Plain Management,
W73-12016 5D

Urban Systems Engineering Demonstration Program. Volume IV: Area wide Storm Drainage and Flood Plain Management,
W73-12019 4C

USE RATES
Impact of Natural Factors on Water Use (Vliyaniye prirodnykh faktorov na vodopotrebleniye),
W73-12062 6G

USSR
US-USSR Expertise Exchange,
W73-12255 6E

USSURI RIVER
Absorption of Solar Radiation by Melting Ice Cover on Rivers and Reservoirs (K voprosu o pogloshchenii solnechnoy radiatsii tayushchim ledyanym pokrovom rek i vodokhranilishch),
W73-12058 2C

UTAH
Hydrologic Reconnaissance of Pilot Valley, Utah and Nevada,
W73-12029 2F

UTRICULARIA
Photosynthesis by Algal Epiphytes of Utricularia in Everglades National Park,
W73-11947 5C

VALLEYS
Hydrogeologic Characteristics of the Valley-Fill Aquifer in the Julesburg Reach of the South Platte River Valley, Colorado,
W73-12296 2F

VALVES
The Effect of Valve Area Gain on the Performance of the Hydraulic Servomechanism,
W73-11723 8C

VALVES (ELECTRICAL)
The Sparking of Lightning Arresters Due to Conductive Contaminants,
W73-11722 8C

VAN ZANDT COUNTY (TEX)
Ground-Water Resources of Rains and Van Zandt Counties, Texas,
W73-12031 2F

VAPOR PRESSURE
Water Diffusion through Cellulose and Amylose Acetates,
W73-11759 3A

VARIABILITY
Patterns of Stream-Discharge Variability (Zakonomernosti v izmenenii modulya stoka),
W73-12056 2E

Methods for Assessing Variability, With Emphasis on Simulation Data Interpretations,
W73-12274 7C

Variability of the Soil Water Flow Parameters and Their Effect on the Computation of Rainfall Excess and Runoff,
W73-12291 2G

VARIANCE
On Double Sampling for Stratification and Analytical Surveys,
W73-12092 5A

VASCULAR FLORA
The Vascular Flora of Anne Arundel County, Maryland: An Annotated Checklist,
W73-12170 2L

VEGETABLE CROPS
Reactions of Herbicides with Soil and Plants,
W73-12266 5B

VEGETATION
Vegetation, Microtopography, and Depth of Active Layer on Different Exposures in Subarctic Alpine Tundra,
W73-11809 2J

Environmental Monitoring Report for Sandia Laboratories from 1964 Through 1972,
W73-11908 5A

A Seasonal Study of the Vegetation on Levees,
W73-12166 2I

Uptake of Mercury by Plants and its Distribution in Living Organisms in an Environment With Increased Concentration of This Element,
W73-12262 5C

VEGETATION ESTABLISHMENT
Development of Dwarf Ground Cover for Erosion Control in Colorado,
W73-12071 4D

VENTILATION
Improved Beef Confinement Facilities Through Pit Ventilation and Tempered Air Intakes,
W73-11775 5C

VERTICAL DISTRIBUTION
Mercury: Vertical Distribution at Two Locations in the Eastern Tropical Pacific Ocean,
W73-12186 5B

VERTICAL FLUXES
On the Determination of Vertical Fluxes in Field Crop Studies,
W73-12183 3F

VERTICAL MIGRATION
The Light Threshold Controlling the Vertical Migration of Chaoborus Punctipennis in a Georgia Impoundment,
W73-11943 5C

VIBRIO
Deoxyribonucleic Acid Base Composition and Taxonomic Position of Glucose Fermenting Marine Bacteria of the Genus Vibrio and Related Genera, (Composition en Bases de L'Adn et Position Taxonomique de Bacteries Marines Fermentant le Glucose, du Genre Vibrio et des Genres Voisins),
W73-12090 5A

VIBRIO PARAHAEMOLYTICUS
Vibrio Parahaemolyticus-Isolation, Identification, Classification, and Ecology,
W73-12144 5A

VIRGINIA (POROPORATANK RIVER)
Distribution of the Salt Marsh Snail (Melampus Bidentatus Say) in Relation to Marsh Plants in the Poropotank River Area, Virginia,
W73-12164 2L

VIRUSES
Improved Beef Confinement Facilities Through Pit Ventilation and Tempered Air Intakes,
W73-11775 5C

Experience with an Image-Analyzing Computer in Virus Plaque Measurements,
W73-12108 5A

VOLTAMMETRY
A Polythene Graphite Electrode for Voltammetry,
W73-12097 5A

WALES (FRONGOCH LAKE)
Population Biology of the Helminth Parasites of Phoxinus Phoxinus (L.) The Minnow, in a Cardiganshire Lake,
W73-11716 2H

WALES (LLYN-CELYN)
The Littoral Fauna of Llyn Celyn, North Wales,
W73-12345 2H

WALLEYES
Hatchery Rearing of Walleyes Using Artificial Food,
W73-12231 8I

WALNUT GULCH WATERSHED (ARIZ)
Uncertainties in Estimating Runoff-Producing Rainfall for Thunderstorm Rainfall-Runoff Models,
W73-12282 2A

WAQUOIT BAY-EEL ESTUARY
A Study of the Marine Resources of the Waquoit Bay-Eel Pond Estuary,
W73-12173 2L

WARNING SYSTEMS
Flash Flood Forecasting and Warning Program in the Western Region,
W73-12020 2E

WASHINGTON
Radioactive Waste Management at Hanford,
W73-11915 5D

Seasonal Distribution of Chondrococcus columnaris Infection in River Fishes as Determined by Specific Agglutinins,
W73-11949 5C

Stochastic Stream Temperature Model,
W73-12289 4A

WASTE ASSIMILATIVE CAPACITY

Method and Apparatus for Separating Water from a Mixture of a Granular Material and Water,
W73-11875 5G

Multi-Stage Flash Evaporator for Distilling Brines,
W73-11877 3A

Method of Purifying Water,
W73-11881 5F

Liquid Filter,
W73-11884 5D

Process for Coagulating and Agglomerating Particulate Material within a Liquid Media,
W73-11894 5D

Water Purification,
W73-11896 5F

Liquid Filtering Apparatus,
W73-11898 5D

Effects of Artificial Aeration on the Chemistry and Algae of Two Michigan Lakes,
W73-11958 5C

Virus in Water: II. Evaluation of Membrane Cartridge Filters for Recovering Low Multiplicities of Poliovirus from Water,
W73-12187 5F

Preventing Filamentous Scale in Well Water,
W73-12188 5F

Continuous Ion Exchange Softening,
W73-12189 5F

Adsorption and Filtration with Granular Activated Carbon,
W73-12190 5F

WATER USERS
Impact of Natural Factors on Water Use (Vliyaniye prirodnykh faktorov na vodopotrebleniye),
W73-12062 6G

Current Water Use Requirements in the Qu'Appelle River Basin,
W73-12232 6D

WATER UTILIZATION
Impact of Natural Factors on Water Use (Vliyaniye prirodnykh faktorov na vodopotrebleniye),
W73-12062 6G

WATER VALUES
An Interactive Analysis of Natural Resource Allocation in a Contemporary Estuarine Ecosystem,
W73-11710 6B

Balancing Environmental and Developmental Values,
W73-12008 6F

WATER VAPOR
The Dose to Man via Food-Chain Transfer Resulting from Exposure to Tritiated Water Vapor,
W73-11851 5C

WATER WELLS
Nitrates Danger for Humans, Too,
W73-11781 5B

Extent of Development and Hydrologic Conditions of the Alluvial Aquifer, Fountain and Jimmy Camp Valleys, Colorado, 1972,
W73-12023 2F

Hydrologic Reconnaissance of Pilot Valley, Utah and Nevada,
W73-12029 2F

Ground-Water Resources of Wheeler and Eastern Gray Counties, Texas,
W73-12032 2F

Ground-Water Resources of the Mora River Drainage Basin, Western Mora County, New Mexico,
W73-12035 2F

WATER WORKS
Inventory and Analysis of Existing Water and Sewer Systems and Long Range Water and Sewer Plans, Natchez, Mississippi,
W73-12015 6D

Urban Systems Engineering Demonstration Program. Volume I: Goals, Objectives, and Standards for Waterworks, Sanitary Sewerage, Solid Waste Management, Storm Drainage and Flood Plain Management,
W73-12016 5D

Urban Systems Engineering Demonstration Program. Volume II: Areawide Water and Sanitary Sewerage Systems,
W73-12017 5D

WATER YIELD
Forecasting Runoff From Universal Surface Gage Snowmelt Measurements,
W73-11853 2C

WATER YIELD IMPROVEMENT
Jackson-Bienville Parishes Dugdemona Watershed District.
W73-11995 6E

WATERSHED MANAGEMENT
Sabine River Authority.
W73-11975 6E

Big Cypress Preserve, Florida.
W73-11993 6E

Jackson-Bienville Parishes Dugdemona Watershed District.
W73-11995 6E

Horse Range Swamp Watershed Project, Orangeburg County, South Carolina (Final Environmental Impact Statement).
W73-12201 4D

WATERSHEDS (BASINS)
Uncertainties in Point and Areal Sampling of Precipitation and Their importance in Hydrologic Computations,
W73-12290 2B

WAVE DIRECTIONAL ANALYSIS
The Directional Analysis of Ocean Waves: An Introductory Discussion (Second Edition),
W73-12306 2E

WAVELENGTHS
The Directional Analysis of Ocean Waves: An Introductory Discussion (Second Edition),
W73-12306 2E

WAVES (WATER)
Statistics of Ocean Wave Groups,
W73-11817 2E

Damping the Energy of Surface Waves by Turbulence (Gasheniye energii poverkhnostnykh voln turbulentnost'yu),
W73-12057 1A

Attenuation of Swell by Sea Ice,
W73-12082 2C

Some Kinetic Energy Spectra in a Nearshore Region of Lake Ontario,
W73-12084 2E

The Directional Analysis of Ocean Waves: An Introductory Discussion (Second Edition),
W73-12306 2E

WEATHER CONDITIONS
Weather Factors Affecting the Development of Maize from Sowing to Flowering,
W73-12346 3F

WEATHER EFFECTS
How Weather Affects Feedlot Performance.
W73-11772 5B

WEATHER MODIFICATION
Research in the Development and Utilization of Atmospheric Water Resources in Montana,
W73-11712 3B

WEATHERING
Ionic Migration and Weathering in Frozen Antarctic Soils,
W73-11836 2K

WELDED JOINTS
Responsible Weld Design,
W73-11743 8G

WELDING
Procedures for Evaluation of Fracture Toughness of Heat-Affected Zones,
W73-11721 8G

Responsible Weld Design,
W73-11743 8G

WELDMENTS
Procedures for Evaluation of Fracture Toughness of Heat-Affected Zones,
W73-11721 8G

Responsible Weld Design,
W73-11743 8G

WELDS
Responsible Weld Design,
W73-11743 8G

WELL REGULATIONS
Utilization of Ground Water Resources.
W73-11971 6E

Groundwater Conservation.
W73-12227 6E

WELLS
Preventing Filamentous Scale in Well Water,
W73-12188 5F

WEST CAMEROON
Ecological Studies on Crater Lakes in West Cameroon Fishes of Barombi, Mbo,
W73-12168 2H

WESTERN LAKE SUPERIOR

UNIVERSITY OF CALIFORNIA
SAN DIEGO

CENTERS OF COMPETENCE
AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 6, NUMBER 20
OCTOBER 15, 1973

W73-12351 -- W73-13000

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 6, NUMBER 20
OCTOBER 15, 1973

W73-12351 -- W73-13000

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

SOVIET STUDY SHOWS POLYWATER DOESN'T EXIST.
Chemical and Engineering News, Vol 51, No 29, p 13-14, July 16, 1973.

Descriptors: *Water chemistry, *Capillary water, Physical properties, Chemical properties, Capillary action, Cohesion, Adhesion, Molecular structure, *Silicates, Water types, Aqueous solutions, Foreign research.
Identifiers: *Polywater, Soviet Union.

The controversy over the existence of 'polywater' (also called 'water II', 'anomalous water', 'orthowater', or 'superwater') has been terminated by its primary originator and chief investigator, Dr. Boris V. Derjaguin (Deryagin) of the Institute of Physical Chemistry of the USSR Academy of Sciences. In a critical review article on world-wide research activities on polywater, titled 'The state-of-the-arts in liquids' modification by condensation', published in 'Recent Advances in Adhesion' (Lieng-Huang Lee, editor; Gordon and Breach, New York and London, 1973), the anomalous behavior of water II is admitted by Derjaguin to be due to impurities, notably silicates leached from the quartz walls of capillary tubes in which anomalous water has to be prepared by condensation. Recent experimental evidence refuting the hypothesis of anomalous polymeric water is mentioned. (Brown-TPC)
W73-12540

02. WATER CYCLE

2A. General

HYDROLOGICAL YEAR-BOOK OF ISRAEL, 1970/71.
Ministry of Agriculture, Jerusalem (Israel). Water Commission.

Hydrological Service Publication, 1972. 161 p.

Descriptors: *Hydrologic data, *Surface waters, *Groundwater, *Hydrologic systems, Foreign countries, Basic data collections, Precipitation (Atmospheric), Streamflow, Runoff, Flow rates, Gaging stations, Water yield, Groundwater movement, Water levels, Water quality, Groundwater recharge, Saline water intrusion, Salinity.
Identifiers: *Israel.

This hydrological yearbook of Israel is the 26th in the series of Hydrological Year-Books. Hydrological and chemical data are presented for the gauging stations on rivers, wadis, main springs, lakes, and reservoirs for the period from October 1, 1970, to September 30, 1971. Yearly rainfall amounted from 80% to 140% of the 1931-60 average in most parts of the country. During November-January rainfall was below average; during April in most regions it was 6 to 14 times that of the long-range average for this month. The total flow from Nahal Keziv in the north to Nahal Shiqma in the south reached about 105 million cu m in 1970-71. Added to this amount was the base flow of Nahal Tanninim and Nahal Ada (downstream the diversion of the Nahaley Menashe project), which amounted to 60 million cu m, with chlorine content of about 850 mg/liter. This total flow measured at the hydrometric stations drains a catchment area of about 6500 sq km compared to the 7800 sq km representing the whole catchment area. The total streamflow includes the quantities stored in various surface reservoirs. In the Kefar Barukh reservoir about 4.3 million cu m were stored, in the Nahaley Menashe reservoirs 15.5 million cu m, and in Shiqma reservoir about 0.9 million cu m were stored. In the spring of 1971, the groundwater level increased by 0.5 m to 1.5 m from that of the previous spring in the northern Coastal Plain. (Woodard-USGS)
W73-12432

HYDROLOGIC MODELS FOR POORLY DEFINED DRAINAGE AREAS,
Nebraska Univ., Lincoln. Water Resources Research Inst.
W. Viessman, Jr.
Available from the National Technical Information Service as PB-222 182, $3.00 in paper copy, $1.45 in microfiche. Project Completion Report, June 1973, 50 p, 27 fig, 5 tab, 26 ref. OWRR-A-021-NEB (1). 14-31-0001-3827.

Descriptors: Hydrology, *Model studies, Rainfall-runoff relationships, *Nebraska, *Drainage area, *Seepage, Management, Storms, *Water management (Applied).

In central Nebraska and many other areas of the Midwest, complex water management problems often arise due to: (1) the flat relief; (2) large surface depressions; (3) rising groundwater levels due to surface irrigation or canal seepage; (4) intense summer storm activity; and (5) poorly defined surface channels. This project was designed to develop modeling techniques for such areas. An individual storm-event model was constructed which employs a series of interconnected reservoirs to simulate large depressed areas.
W73-12496

AN APPROACH TO HYDROGEOLOGIC INVESTIGATIONS OF RIVER ALLUVIUM BY THE USE OF COMPUTERIZED DATA PROCESSING TECHNIQUES,
Oklahoma State Univ., Stillwater. Dept. of Geology.
D. C. Kent, J. W. Naney, and B. B. Barnes.
Ground Water, Vol 11, No 4, p 30-41, July-August 1973. 7 fig, 3 tab, 13 ref.

Descriptors: *Surface-groundwater relationships, *Hydrogeology, *Data processing, *Alluvium, Mathematical models, Alluvial channels, Water balance, Data storage and retrieval, Aquifers, Computer programs, Mapping, Stratigraphy, Oklahoma.

A data storage and retrieval system for hydrogeologic data is designed to produce lithology distribution maps, isophachous maps, and cross sections showing the boundaries and hydraulic characteristics of river alluvium. Emphasis is placed on selecting and coding characteristics of the alluvial sediments, which will facilitate description in terms of hydraulic properties. The hydraulic properties of fluvial deposits for input to the system are defined by analysis of core samples and pump tests. A groundwater study was conducted in the Washita River valley in south-central Oklahoma. Maps and cross sections from the retrieval system were used in conjunction with the hydraulic coefficients and water-level records to estimate the rate of groundwater flow and storage. This information was used for developing a mathematical model of surface runoff as influenced by upstream tributary development. (Knapp-USGS)
W73-12942

FLOW TO WELLS NEAR STREAMS IN THE PRESENCE OF DELAYED YIELD FROM STORAGE AND ANALYSIS OF PUMPING TEST DATA,
Bulgarian Academy of Sciences, Sofia. Geological Inst.
For primary bibliographic entry see Field 04B.
W73-12943

REPORTS FOR CALIFORNIA BY THE GEOLOGICAL SURVEY WATER RESOURCES DIVISION.
Geological Survey, Menlo Park, Calif.

Open-file report, 1973. J. S. Bader, and F. Kunkel, compilers. 111 p.

Descriptors: *Bibliographies, *Water resources, *California, *Publications, Documentation, Information retrieval, Hydrology, Climatic data, Meteorological data, Hydrologic data, Surface waters, Groundwater, Streamflow, Runoff, Water quality, Chemical analysis, Water pollution sources, Water pollution control, Ecology, Water supply, Water demand, Water utilization, Water resources development, Management, Programs, Indexing.

The U.S. Geological Survey has been making water-resources studies in cooperation with the State of California and other public agencies since 1898. This bibliography lists alphabetically by author all water-resources reports prepared by the Geological Survey for those agencies through March 1973. It also lists selected nationwide reports that contain information pertinent to California. In addition, general hydrologic and research reports by personnel of the California district office or the Western regional office at Menlo Park, Calif., are included. The bibliographic list is indexed according to hydrologic area, county, and subject. A report may be indexed under one or more hydrologic areas, counties, and (or) subjects. (Woodard-USGS)
W73-12953

PUBLICATIONS OF WATER RESOURCES INVESTIGATIONS IN COLORADO AND SELECTED PUBLICATIONS PERTAINING TO COLORADO.
Geological Survey, Denver, Colo. Water Resources Div.

Geological Survey, Colorado District report, 1973. 33 p.

Descriptors: *Water resources, *Publications, *Bibliographies, *Colorado, *Projects, Investigations, Water resources development, Groundwater, Surface waters, Geology, Sediment transport, Hydrologic data, Aquifers, Streamflow, Floods, Water quality, Information retrieval.

The water-resources program of the U.S. Geological Survey consists of the collection of basic information through its hydrologic-data stations, areal hydrologic and interpretive studies, and research projects. The basic data collected, the results of the areal studies, and the research findings are presented mainly in publications of the U.S. Geological Survey and Colorado agencies, but some appear also in technical journals and other publications. This list contains publications of water-resources investigations in Colorado that are either published or in preparation and selected publications pertaining to Colorado. (Woodard-USGS)
W73-12954

2B. Precipitation

THEORY OF PRECIPITATION EFFECTS ON DEAD CYLINDRICAL FUELS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
M. A. Fosberg.
For Sci Vol 18, No 2, p 98-108. 1972. Illus.
Identifiers: *Forest fuels, *Precipitation theory, Water uptake.

Numerical and analytical solutions of the Fickian diffusion equation were used to determine the effects of precipitation on dead cylindrical forest

fuels. The analytical solution provided a physical framework. The numerical solutions were then used to refine the analytical solution through a similarity argument. The theoretical solutions predicted realistic rates of water exchange and the internal distribution of the water. The theory also predicted that precipitation duration rather than amount or rate determined the amount of water uptake and provided a function useful in practical applications.--Copyright 1972, Biological Abstracts, Inc.
W73-12381

WATER CONTENT IN CONVECTIVE STORM CLOUDS,
National Center for Atmospheric Research, Boulder, Colo.
T. G. Kyle, and W. R. Sand.
Science, Vol 180, No 4092, p 1274-1276, June 22, 1973. 2 fig, 6 ref.

Descriptors: *Clouds, *Moisture content, Storms, Convection, Hydrologic cycle, Aircraft, Sampling, Measurement, Instrumentation, Atmosphere, Meteorology.
Identifiers: *Storm clouds.

As part of the National Hail Research Experiment, the condensed water content of severe convective storm clouds was measured with an electrically heated evaporator mounted at the wing tip of an armored penetrating aircraft. Cloud interiors were found to be characterized by 1 to 2 km long regions having condensed water contents of approximately 20 g per cu m. (Brown-IPC)
W73-12536

CLIMATOLOGY OF RAINFALL PROBABILITIES FOR OAHU, HAWAII,
National Weather Service, Honolulu, Hawaii. Pacific Region.
A. N. Hull, and J. Pitko.
Available from NTIS, Springfield, Va. 22151, as COM-73-10242 Price $3.00 printed copy; $1.45 microfiche. Technical Memorandum NWSTM PR-10, April 1972. 48 p, 23 fig, 3 tab, 2 append.

Descriptors: *Climatic data, *Hawaii, *Meteorological data, *Precipitation (Atmospheric), *Weather forecasting, Probability, Statistics, Weather data, Weather patterns, Orography, Winds.
Identifiers: *Oahu (Hawaii).

Probability forecasts are given for local and island-wide rainfall for Oahu, Hawaii. Statistical probability of rainfall is tabulated by months. Also included is the persistence of 'wet' or 'dry' periods. The combination of climatological probability of rainfall and the persistence of the present weather are essential information for reaching a logical forecast of rain or no rain for any location on the island of Oahu. Maps show the statistical probability of daily rainfall for Oahu for each month of the year as well as an annual summary. Also included is a brief description of the various rainfall regimes that are found on the island. The data used in preparing the maps were extracted from the latest 30 years (1941-1970) of rainfall records. For regions of sparse data, shorter periods of record were used but in no case were records with less than 15 years entered into the analyses. In all, the data from 68 stations were plotted and analyzed. The frequency distribution of hourly rainfall statistics was gained by compiling hourly data for five stations representing different rainfall regimes on Oahu. For the normally dry areas of Oahu, summer has the lowest percentage of rainy days per month and winter the highest percentage. July presents an anomalously high percentage in most of these dry areas. In the normally wet areas of Oahu, summer has the highest percentage of rainy days per month with winter having the lowest percentage. The most populated areas of the island normally have monthly percentages of rainy days in the range of 40%-60% each month. (Knapp-USGS)
W73-12587

EXTREMES OF HYDROMETEORS AT ALTITUDE FOR MIL-STD-210B: SUPPLEMENT--DROP-SIZE DISTRIBUTIONS,
Air Force Cambridge Research Labs., L. G. Hanscom Field, Mass.
P. Tattleman, and N. Sissenwine.
Available from NTIS, Springfield, Va. 22151 as AD-756 832 - Price $3.00 printed copy; $1.45 microfiche. Technical Report AFCRL-TR-73-0008, January 9, 1973. 15 p, 1 fig, 3 tab, 8 ref.

Descriptors: *Rainfall intensity, *Rain, *Tropical regions, *Raindrops, Rain water, Rainfall, Precipitation (Atmospheric).
Identifiers: *Raindrop sizes.

Estimates have been provided for extreme rainfall intensities and associated liquid water content at altitude with 0.1% and 0.5% probabilities in the most severe month in the rainy tropics. Analogous values have been included for two alltime record rainstorms, one for 1 min, and the other lasting 42 min. Drop-size distributions are given for the 1 min record, and for the 0.1% and 0.5% worst month in tropics from a theoretical expression that best fits the available empirical size distributions. Liquid water content obtained from an integral of this theoretical expression is compared to the liquid water content obtained by arithmetically adding the volumes of each drop for three drop-size distributions. (Knapp-USGS)
W73-12599

ON THE NUMBER DISTRIBUTION OF HAIL GROWING IN UPDRAFTS,
Toronto Univ. (Ontario). Dept. of Physics.
R. B. Charlton, and R. List.
Available from NTIS, Springfield, Va. 22151 as COM-72-11428 - Price $3.00 printed copy; $1.45 microfiche. In: Proceedings of Conference on Cloud Physics, August 24-26, 1970, Fort Collins, Colorado: Colorado State University, p 51-52, 1971. 7 fig, 3 ref.

Descriptors: *Cloud physics, *Hail, *Crystal growth, *Air circulation, Convection, Atmosphere, Freezing, Model studies, Storms, Graupel, Meteorology, Mass curves.

The formation of hail in a convection updraft causes liquid water depletion and imposes a body force on the updraft's air parcels. Conversely, the growth of hailstones is dependent on their ability to compete for the available liquid water and on the updraft field's reaction to their presence. A model is based on hail embryos injected continuously in known numbers and sizes at the OC level of a nondivergent (cloud air density times updraft velocity equals constant at all levels) and predetermined updraft. The only cloud parameter directly influenced by the growing hailstones is the liquid water content (LWC). The hailstones move at terminal velocity (drag coefficient 0.5) and accrete (with 100% efficiency) the LWC which moves at updraft speed. Two types of growth from an embryo size spectrum are considered, both of which are steady-state. The first grows hail as it ascends from the input level. The second type considers hailstones ascending to their balance levels and also growing while descending back to the input level. All examples calculated showed that hail mass accumulation zones can be equivalent only to 2 to 4 times the natural LWC, and that moderate LWC depletion (20-40%) is equally sufficient to considerably influence the cloud's energy balance. (Woodard-USGS)
W73-12602

DYNAMICS OF A FALLING PARTICLE ZONE,
Toronto Univ. (Ontario). Dept. of Physics.
T. L. Clark, and R. List.
Available from NTIS, Springfield, Va. 22151 as COM-72-14428 - Price $3.00 printed copy; $1.45 microfiche. Journal of the Atmospheric Sciences, Vol 28, No 5, p 718-727, July 1971. 8 fig, 12 ref. NOAA Grant E22-75-71 (G).

Descriptors: *Cloud physics, *Precipitation (Atmospheric), *Particle size, Raindrops, Dynamics, Model studies, Numerical analysis, Meteorological data, Temperature, Winds, Velocity, Atmosphere, Air circulation, Equations, Drops (Fluid).
Identifiers: *Precipitation particles.

Some of the factors which can affect the distribution of precipitation-sized particles within a cloud are coalesence, breakup, sedimentation, and gravitational feedback effects. The two latter factors are discussed. Two-dimensional zones of single-sized particles falling in still air are discussed using a numerical model. Coalescence and breakup is ignored so that the fall pattern and the flow created by the falling particles can be isolated. The results indicate that the rather unorthodox use of an eddy viscosity in the momentum equations and not in the advection equation for the particle zone did not affect the calculations appreciably. Thus, the results can be assumed to visualize the nonturbulent case of a falling particle zone. (Woodard-USGS)
W73-12603

SIMULATIONS OF METEOROLOGICAL VARIATIONS OVER ARCTIC COASTAL TUNDRA UNDER VARIOUS PHYSICAL INTERFACE CONDITIONS,
Center for the Environment and Man, Inc., Hartford, Conn.
N. W. Lord, J. P. Pandolfo, and M. A. Atwater.
Arct Alp Res. Vol 4, No 3, p 189-209. 1972. Illus.
Identifiers: *Arctic coastal zone, *Meteorological conditions, Moisture, *Simulation, Temperature, *Tundra.

Meteorological properties of the tundra are treated within the context of a general ecosystem model. The biosphere is placed in the role of an active interface within a stack of horizontally uniform physical layers under the influence of incident solar radiation, the demonstrably dominant exogenous state variable. Diurnal variation of the thermodynamic states of these physical layers is calculated as the solution of differential equations governing the diffusion of heat and moisture. The results of numerical experiments on dry ground regions demonstrate that atmospheric moisture and temperature, during the biotically active summertime, are influenced by the meteorological history of the immediately preceding summertime level of the permafrost boundary. They are influenced to a degree that is at least comparable to the effect of daily fluctuations in cloud cover and prevailing winds. Numerical experiments on tundra shallow lakes imply a strong influence by the region's heterogeneity on near-surface air temperatures.--Copyright 1973, Biological Abstracts, Inc.

GLACIAL ENVIRONMENT AND PROCESSES IN SOUTHEASTERN ALASKA,
Massachusetts Univ., Amherst. Coastal Research Center.
J. H. Hartshorn, and G. M. Ashley.
Technical Report No 4-CRC, August 1972. 69 p, 79 fig. ONR N00014-67-A-0230-0001.

Descriptors: *Erosion, *Sedimentation, *Glaciation, *Alaska, *Geomorphology, Land forming, Topography, Sediment transport, Glacial drift, Alluvial fans, Alluvium, Glaciers, Braiding, Sedimentary structures.

The dominant surficial geologic processes in southeastern Alaska are glaciation and stream action. Glaciers erode bedrock, sculpture characteristic landforms, and deposit subglacial and marginal debris. In areas vacated by the glacier, sediment-laden streams help to construct a landscape whose varied landforms originate from the complex interaction between a retreating ice margin, disintegrating ice, and running or ponded meltwater. The major landforms in terms of area and volume are outwash fans, which are formed seaward of the glaciers mainly by the accretion of bars in braided streams, and which commonly form the low-lying coastal foreland. The sediment in transport in meltwater streams may be stored permanently or temporarily in glaciofluvial landforms or may reach its ultimate destination, the sea, where it is reworked by coastal erosion and deposition. SNOW COVER OF THE ISSYK-KUL' DEPRESSION AND ITS ALPINE ENVIRONMENT (SNEZHNYY POKROV ISSYK-KUL'SKOY KOTLOVINY I YEYE VYSOKOGORNOGO OBRAMLENIYA),
A. N. Dikikh.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya, Vol 105, No 1, p 47-51, January-February 1973. 1 fig, 3 tab, 3 ref.

Descriptors: *Snow cover, *Snowpacks, *Alpine, *Mountains, Glaciers, Density stratification, Precipitation (Atmospheric), Weather, Air temperature, Snow surveys, Maps.
Identifiers: *USSR (Kirgiz), *Issyk-Kul' depression.

Characteristics of snow cover in the Issyk-Kul' depression were investigated in snow surveys performed by the Kirgiz Administration of the Hydrometeorological Service. Average duration of snow cover ranges from 39 days in the vicinity of Cholpon-Ata to 297 days in the glacierized zone. Snow density in the initial period of formation of snow cover varies between 0.16 and 0.20 g/cu cm. Snow density on glaciers in the initial period of snow accumulation reaches 0.40 g/cu cm. On the basis of snow-cover distribution, 4 regions were identified: (1) the western part, where snow depths are 0-10 cm; (2) the central and eastern parts, where snow depths are 10-50 cm; (3) the northern slopes of Terskey Alatoo ridge in the eastern part, where snow depths are 50-100 cm; and (4) the glacierized zone of the ridge, where snow depths are greater than 100 cm. Maximum average 10-day depths of snow cover in the depression are tabulated and mapped. (Josefson-USGS)

2D. Evaporation and Transpiration

EVAPORATION DURING A FLOOD PERIOD CAUSED BY SPRING SNOWMELT (ISPARENIYE V PERIOD VESENNEGO SNEGOTAYANIYA I POLOVOD'YA),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
O. I. Krestovskiy, A. N. Postnikov, and A. G. Sergeyeva.
In: Voprosy formirovaniya vesennego polovod-'ya; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 194, p 165-182, Leningrad, 1972. 1 fig, 8 tab, 28 ref.

Descriptors: *Evaporation, *Floods, *Snowmelt, *Spring, Water loss, Water balance, Water storage, Runoff, Precipitation (Atmospheric), Snow, Water equivalent, Soils, Surfaces, Watersheds (Basins), Forest watersheds, Grasslands, Estimating, Measurement, Equations.
Identifiers: European USSR, *Kazakhstan.

Evaporation from snow, water, and soil surfaces in spring was investigated on lowland areas in European Russia and DKazakhstan. Estimates are made of losses of water to evaporation during a flood period for watersheds in forested and forest-steppe regions of European Russia, and methods are proposed for evaporation measurements in the northwest. In the northwestern forested region, total evaporation from watersheds varies annually between 35 mm and 90 mm (average 60 mm) and depends mainly on the duration of the spring flood. In forest-steppe and steppe regions, total evaporation from watersheds during flood periods for different spring seasons varies between 15 mm and 60 mm (average 35-45 mm). In northwestern and forest-steppe regions, total evaporation averages 1.2 mm/day. Water losses to total evaporation in forested and forest-steppe regions average 30% of the precipitation and water equivalent of snow in a flood period and vary annually from 10% in flood periods with heavy snow accumulation to 70% in relatively open spring seasons. A COMPARISON OF RATES OF WATER LOSS THROUGH TRANSPIRATION OF SEVERAL SOUTHERN NEW MEXICO PHREATOPHYTE SPECIES,
New Mexico State Univ., University Park. Dept. of Biology.
G. L. Cunningham, J. G. Fraser, R. E. Grieve, and H. G. Wolfe.
Available from the National Technical Information Service as PB-222 277, $3.00 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute Report No. 025, Technical Completion Report, 1973, 32 p, 12 fig, 4 tab, 17 ref. OWRR-B-021-NMEX (1) and B-027-NMEX (1).

Descriptors: *Phreatophytes, *New Mexico, *Transpiration, Transpiration control, Mathematical models, *Water loss, Riparian plants, *Riparian water loss.
Identifiers: *Species leaf surface area, Basal stem diameter, Boundary layer resistance, Stomatal resistance, Mesophyll resistance, Irradiance, Prosopis pubescens (Screw bush), Salix amygdaloides (Willow), Tamarix pentandro (Salt cedar), Baccharis glutinosa (Seep willow), Lycium torieyi (Wolfberry), Populus fremontii (Cottonwood).

The development and use are described of a method of estimating transpirational water use by riparian plant communities. The method involves the development and use of mathematical models to predict transpiration rates on a leaf area basis from environmental data. These models were used in conjunction with leaf area estimates for a study stand to evaluate transpirational water use. The results indicate that differences exist among species. Species which are found in less disturbed stands tend to be much more conservative in their transpirational water use. (Creel-New Mexico State)

AVERAGE BOWEN-RATIO METHODS OF CALCULATING EVAPORTRANSPIRATION APPLIED TO A DOUGLAS FIR FOREST,
British Columbia Univ., Vancouver. Dept. of Soil Science.
T. A. Black, and K. G. McNaughton.
Boundary-Layer Meteorol. Vol 2, No 4, p 466-475. 1972. Illus.
Identifiers: *Bowen-ratio method, *Douglas-Fir, *Evapotranspiration, Forests, Transpiration, Winds, Measurement.

Daily evapotranspiration from a Douglas fir forest was calculated using Webb's average Bowen-ratio method. Webb's method is generalized to include the effects of the diabatic wind profile. Over a 17-day period characterized by light winds, the modified Webb method agreed with the daily totals of half hr energy balance calculations to within 1 1/2% on the average, while Webb's method overestimated by 26% on the average.--Copyright 1973, Biological Abstracts, Inc.

Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
S-A. Hsu, M. E. C. Giglioli, P. Reiter, and J. Davies.
Caribb J Sci. Vol 12, No 1-2, p 9-22, 1972, Illus.
Identifiers: *British West Indies, *Grand Cayman Island (B.W.I.), Heat balance, Mangrove, Swamp, Transpiration, Water balance, *Evapotranspiration.

On the basis of field measurements from 1967 through 1970 and all available climatological data on Grand Cayman Island (British West Indies), components of heat and water-balance equations were analyzed. Water-balance studies on a riverless, tropical coast showed that the soil-moisture content can be estimated by measuring the difference between precipitation and evaporation on sandy coasts and between precipitation and evapotranspiration in mangrove swamp areas. Heat-balance studies in the same environments revealed that on a mangrove swamp floor the potential evapotranspiration can be predicted by the ratio of net radiation to latent heat of vaporization.--Copyright 1973, Biological Abstracts, Inc.

ANTITRANSPIRANT FILM: CURTAILING INTAKE OF EXTERNAL WATER BY CHERRY FRUIT TO REDUCE CRACKING,
California Univ., Davis. Dept. of Water Science and Engineering.
D. C. Davenport, K. Uriu, and R. M. Hagan.
Hortscience, Vol 7, No 5, p 507-508, 1972. Illus.
Identifiers: Absorption, *Cherry fruit, Cracking, Films, Fruit, Prunus-avium, Rain, *Antitranspirant films.

An antitranspirant film was used as a research tool to determine which part of the sweet cherry (Prunus avium L.) fruit is the principal path for absorption of external water (rain). Antitranspirant applied to the entire fruit surface reduced water intake to half that of control fruit or fruit treated only on the top and/or bottom. A preliminary field trial investigated the film's 'raincoating' effect as a possible means for reducing cherry cracking.--Copyright 1973, Biological Abstracts, Inc.

FACTORS PRODUCING THE OUTSTANDING SPRING FLOOD OF 1970 IN UPPER DON RIVER BASINS (USLOVIYA FORMIROVANIYA VYDAYUSHCHEGOSYA VESENNEGO POLOVOD'YA 1970 G. V BASSEYNAKH REK VERKHNEGO DONA),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
L. K. Vershinina.
In: Voprosy formirovaniya vesennego polovod-'ya; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 194, p 75-92, Leningrad, 1972. 4 fig, 9 tab, 6 ref.

Descriptors: *Floods, *Spring, *River basins, Discharge (Water), Runoff, Water loss, Water balance, Water storage, Precipitation (Atmospheric), Water equivalent, Snowmelt, Melt water, Thawing, Ice, Antecedent moisture content, Field capacity, Air tempeerature, Equations.
Identifiers: USSR, *Don River.

The factors responsible for the 50 to 100 year flood on the Upper Don in the spring of 1970 are examined. An exceptionally high rate of snowmelt, reaching 40-50 mm/day, was observed in northern regions of the basin, while the rate of snowmelt in southern regions did not exceed 5-10 mm/day. This difference in snowmelt rates was the principal cause of major flooding in the north and of minor flooding in the south. Spring-runoff losses were 120-150 mm or 70% of total water storage in southern regions and 30-40 mm or 15%-25% of total water storage in northern regions. (See also W73-12435) (Josefson-USGS)

THE SUPERIMPOSITION HYPOTHESIS FOR INCISED MEANDERS--A GENERAL REJECTON AND SPECIFIC TEST,
Makerere Univ., Kampala (Uganda).
K. J. Tinkler.
Area (Institute of British Geographers), Vol 4, No 2, p 86-91, 1972. 1 fig, 12 ref.

Descriptors: *Meanders, *Geomorphology, Valleys, Topography, Paleoclimatology, Drainage patterns (Geologic).

The superimposition hypothesis that incised bedrock meanders are inherited from river (alluvial) meanders in a previous low relief cycle is disputed. A specific test based on known area/wavelength relationships for valley and river meanders is proposed. The lithological environment of the channel exerts a controlling influence on channel meander wavelength. There is no great difference between the dimensionless ratios that characterize the geometry of meanders incised in rock and those for alluvial, or river, meanders. The lithological environment acts as a filter on wavelengths so that for a given lithology, wavelengths begin to form only when some threshold stress is overcome by channel flow sufficient to induce bank erosion. A wide range of discharges is in fact available in most streams. For most lithologies a discharge with sufficient power to induce bank erosion probably exists in most streams given a long enough recurrence interval. It is evident that meander parameters are not unambiguous indicators of Pleistocene climates. (Knapp-USGS)

HYDROLOGIC RECORDS FOR LAKE COUNTY, FLORIDA: 1971-72,
Geological Survey, Tallahassee, Fla.
C. P. Laughlin, and M. C. Schol.
Geological Survey Open-file report (73009), 1973. 87 p, 47 fig, 24 tab, 4 ref.

Descriptors: Water resources, *Hydrologic data, *Groundwater, *Surface waters, *Florida, Basic data collections, Rainfall, Streamflow, Runoff, Aquifer characteristics, Well data, Water levels, Water quality, Chemical analysis, Lakes, Hydrology.
Identifiers: *Lake County (Fla).

Records of water levels in wells and lakes and chemical and bacteriological analyses are reported for Lake County, Florida, from May 1971 to May 1972. Stream discharge records are reported on a water year basis; stream-discharge records are presented for the 1971 water year (October 1, 1970 to September 30, 1972). The flow of Big Creek near Clermont and Palatlakaha River at Cherry Lake Outlet was very low for the 1971 water year (9% and 14%, respectively) compared to the long-term average. The long-term, month-end hydrographs show that lake levels were the highest of record in 1960 and lowest in 1962. The levels in the lakes of the Apopka chain were generally near normal throughout 1971and near normal or above during the first part of 1972. Most groundwater withdrawn in the county is from the Floridan aquifer. Water levels in the Floridan aquifer in May 1972 were generally higher than in May 1971. However, in the northern part of the county and also in the Mascotte-Groveland area, the water levels were down. Three streams, 5 lakes, and 8 clastic-aquifer wells are sampled annually for chemical analyses under this program. In addition, water-quality data are available for 2 streams and 9 lakes in the county from other Geological Survey cooperative programs. The chemical analyses are tabulated. (Woodard-USGS)

G. Bortolami, J-C. Fontes, and C. Panichi.
Earth and Planetary Science Letters, Vol 19, No 2, p 154-167, June 1973. 4 fig, 18 ref.

Descriptors: *Groundwater movement, *Water circulation, *Artesian aquifers, *Confined water, *Recharge, Stable isotopes, Carbon radioisotopes, Hydrogeology, Karst, Karst hydrology.
Identifiers: *Italy (Venice).

The subsidence of the plain of Venice (about 1 cm/yr) is caused by overexploitation of deep artesian aquifers. Stable isotopes show the existence of two groups of deep waters both correlated to a cold climatic recharge. These waters are clearly different from those of the unconfined shallower aquifers. The deep waters are recharged in the basins of the Prealpine rivers. Brenta and Piave, in the paleochannel of the alpine river Adige. The waters of Prealpine type are located under the main part of the plain. The waters coming from the Prealpine area exhibit relatively high tritium contents (85 to 120 TU) and rather low C-14 activities (60% to 70%). The dissolved carbon has not undergone any significant exchange with solid carbonates. The circulation is rapid in the recharge areas where the waters circulate in the hydrographic network of the karstic system of the Prealps. In the lower parts of the plain the flow velocities are low and decrease eastward and downward from 3 m/yr to 1 m/yr. It is possible that a drastic reduction of these velocities occurs in the western part of the plain due to a major sedimentological discontinuity, such as the western limit of the marine deposits. In: Voprosy formirovaniya vesennego polovod-'ya; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 194, p 62-74, Leningrad, 1972. 7 fig, 6 tab, 4 ref.

Descriptors: *Water loss, *Groundwater recharge, *Floods, *Watersheds (Basins), *Forecasting, Estimating, Water storage, Water table, Water equivalent, Snowmelt, Runoff, Spring, Variability, Curves.
Identifiers: European USSR, *Valday Field Laboratory.

Groundwater recharge during a spring flood is defined as the difference in groundwater storage at the beginning and end of the flood. At the beginning of a flood, groundwater storage in the Valday Hills varies in individual years between 50 mm and 100 mm (coefficient of variation is 0.22). At the end of a flood, groundwater storage averages 120 mm and varies slightly from year to year (coefficient of variation is 0.03). Water losses average 50 mm and vary annually between 25 mm and 65 mm (coefficient of variation is 0.22). At the beginning of a flood, groundwater storage in individual plots for different years varies between 10 mm and 160 mm and at the end of a flood, between 50 mm and 240 mm. Water losses on individual plots vary between 0 mm and 150 mm. Recommendations are given for a 2-3 month advance forecast of water losses to groundwater recharge for consideration in preparing forecasts of spring runoff in northwestern European Russia. GROUND-WATER RESOURCES, NELSON AND WALSH COUNTIES, NORTH DAKOTA,
Geological Survey, Grand Forks, N. Dak.
J. S. Downey.
North Dakota State Water Commission County Ground-Water Studies 17, Part 3, and North Dakota Geological Survey Bulletin 57, Part 3, 1973. 25 fig, 4 plate, 5 tab, 60 ref.

Descriptors: *Groundwater resources, *Water wells, *Water supply, *North Dakota, Well data, Aquifer characteristics, Water yield, Water quality, Specific capacity, Transmissivity, Groundwater movement, Hydrogeology, Water level fluctuations.
Identifiers: *Nelson and Walsh Counties (N DAK).

Nelson and Walsh Counties, North Dakota, are underlain by bedrock of Ordovician, Jurassic, and Cretaceous age. The Fall River and Lakota Formations (Dakota aquifer) and the Pierre Formation of Cretaceous age contain the principal bedrock aquifers. The Dakota aquifer, which consists of sandstone, may yield more than 500 gpm at selected locations. The Pierre aquifer, which consists of fractured shale, yields from 1 to 5 gpm. Water from both aquifers is of poor quality, but usable. The Jurassic and Ordovician aquifers yield a sodium chloride type water that is very saline. Yields greater than 500 gpm may be locally available from the Ordovician aquifers. The Spiritwood, McVille, and Fordville glacial-drift aquifers are capable of yielding more than 500 gpm of fair to good quality water. Several smaller drift aquifers--the Edinburg, Medford, and beach deposits--supply water of good to poor quality. The eastern part of Walsh County is the discharge area for a deep regional groundwater flow system that originates in the high parts of Cavalier, Nelson, and Walsh Counties and areas to the west. Water moving in this flow system becomes more saline and becomes a sodium chloride type as it moves to the discharge area. Saline lakes occur in eastern Walsh County as the result of natural artesian discharge from the deep groundwater flow system. Six communities in the project area use groundwater supplies. (Woodard-USGS)

GEOLOGY OF NELSON AND WALSH COUNTIES, NORTH DAKOTA,
Geological Survey, Grand Forks, N. Dak.
J. P. Bluemle.
North Dakota Geological Survey Bulletin 57, Part 1, and North Dakota State Water Commission County Ground Water Studies 17, Part 1, 1973. 30 fig, 4 plate, 52 ref.

Descriptors: *Geology, *Groundwater, *Aquifers, *North Dakota, Natural resources, Land use,

Construction, Foundations, Topography, Surveys, Mapping, Bedrock, Glacial sediments, Economics, Construction materials, Gravels.
Identifiers: *Nelson and Walsh Counties (N Dak).

Nelson and Walsh Counties are located in northeastern North Dakota on the Eastern edge of the Williston basin. Precambrian rocks range in depth from 300 to 2,800 feet. They are overlain by Paleozoic and Mesozoic rocks that dip to the west at low angles. Glacial drift covers the entire area except along a few deeply eroded valleys where Cretaceous shale is exposed. The glacial drift reaches a maximum thickness of over 300 feet in the McVille trench of southern Nelson County. Economic mineral deposits include sand and gravel of the beach ridges and river terraces and groundwater and surface water. Although no commercial hydrocarbon production has yet been found, the many possibilities for stratigraphic and structural traps along with shallow drilling depths allowing easy and fast drilling sould do much to promote exploration in the area. The glacial deposits form the major aquifers in the prospect area. Detailed geologic maps of the two-county area are included. The information should be of value to anyone interested in the distribution of the geologic units that have potential as aquifers. Data are also supplied on the engineering properties of foundation materials at possible construction sites. (Woodard-USGS)
W73-12579

PRESIDIO BOLSON, TRANS-PECOS TEXAS AND ADJACENT MEXICO: GEOLOGY OF A DESERT BASIN AQUIFER SYSTEM,
Texas Univ., Austin.
C. G. Groat.
Bureau of Economic Geology Report of Investigations No 76, 1972. 46 p, 20 fig, 56 ref.

Descriptors: *Hydrogeology, *Bolsons, *Texas, *Alluvium, *Groundwater basins, Stratigraphy, Sedimentology, Mexico, Geomorphology, Gravels, Erosion, Aquifers.
Identifiers: *Presidio (Tex).

The Presidio Bolson in Texas and Mexico is one of several mountain-bounded basins in the Mexican Highlands section of the Basin and Range physiographic province. Mountain-bounded basins or bolsons are the most important aquifer systems throughout most of southwestern and western United States and northern Mexico. The dissection of the Presidio Bolson by the Rio Grande and its tributaries has afforded an ideal situation for detailed study of the stratigraphy of one of these important aquifer systems. The basin is filled with detritus from the surrounding mountains. Poorly sorted conglomerate and interbedded sandstone deposited on alluvial fans characterize the basin-margin facies; gypsiferous mudstone and fine sandstone of the basin-center facies (the greatest volume of deposits) were deposited on the toes of alluvial fans and in playa lakes. Groundwater is the most valuable resource in the basin. The most reliable supplies are obtained from Rio Grande alluvium south of the juncture with the Rio Conchos. Sidestream alluvium yields small quantities of water in a few places. The bolson fill is potentially the most important aquifer, but the large plug of impermeable, gypsiferous mudstone results in small yields of poor-quality water over much of the bolson. (Knapp-USGS)

CONVECTIVE GROUND WATER FLOW,
Technical Univ. of Denmark, Lyngby. Inst. of Hydrodynamics and Hydraulic Engineering.
J. Eliasson.
Series Paper No 3, 1973. 107 p, 30 fig, 11 tab, 23 ref.

Descriptors: *Convection, *Groundwater movement, Porous media, Boundary processes, Mathematical studies, Computer programs, Mass transfer, Heat transfer, Heat flow, Turbulence.

Convective groundwater flow and related phenomena may be investigated by two methods that are different both in principle and applicability. The first method is the linear method. The criterion for its application is that the departures of temperatures and velocities from their mean values are so small that terms quadratic in these quantities can be neglected. The linear method is applicable to subcritical flow and to analysis of the stability of stationary flows. When the initial instabilities have grown big enough, the linear flow is replaced by nonlinear convection where interactions between flow on different frequencies is predominant. In the two-dimensional case, when the flow is a system of horizontal rectangular rolls, this interaction between the frequencies can be written in terms of the Fourier transform of the temperature function or the stream function. (Knapp-USGS)

GROUND WATER MODELS WITH PARALLEL LINEAR RESERVOIRS,
Technical Univ. of Denmark, Lyngby. Inst. of Hydrodynamics and Hydraulic Engineering.
J. Eliasson, S. Arnalds, S. Johannsson, and S. P. Kjaran.
Series Paper No 1, 1973. 53 p, 19 fig, 5 tab, 6 ref.

Descriptors: *Hydrogeology, *Groundwater movement, *Unsteady flow, *Water level fluctuations, Mathematical models, Computer programs, Boundary processes, Artesian aquifers, Surface-groundwater relationships.

Unsteady groundwater flow in an aquifer of limited horizontal extent and arbitrary boundary shape may be described by the differential equation of heat conduction, the solution of which includes the solving of an eigenvalue problem by a numerical method. Boundary conditions are provided by nature in the form of watertight formations, rivers, lakes, or any other kind of constant hydraulic head connected to the aquifer. Discharge is the sum of the flow through infinitely many linear reservoirs, corresponding to the eigenfunctions. The resulting equations for groundwater level and discharge are sums of convolution integrals of the infiltration, an easy process to handle in a digital computer. The mathematical model derived was used to analyze the inflow into a water reservoir in Iceland from a nearby lavafield, and the runoff is compared with flow data. (Knapp-USGS)

Identifiers: *Fracture traces, Fluid saturated soil layer, Zone of mineralization, Primary flow chemicals.

Traditionally, geophysical exploration has been associated mainly with the petroleum and mining industries. The use of seismic, gravity and magnetic exploration methods in the search for oil and gas, and the use of electric, magnetic and gravity techniques in the search for metallic mineral deposits are well established. To a lesser extent, various geophysical surveying procedures have been applied to ground-water exploration; recently, fostered by increased consumption of resources and greater awareness for environmental problems, new problems have arisen which have led to new and more sophisticated applications of geophysical techniques. Case studies are presented on the use of geophysical techniques in the areas of direct and indirect ground-water source exploration, location of sources of acid mine drainage and other ground water pollutants. Emphasis is placed on the development of new procedures introduced to overcome some of the problems which have limited the applications of conventional geophysical methods utilized in shallow depth exploration in the past. (Campbell-NWWA)

EVALUATION OF A SHALLOW LEAKY WATER TABLE AQUIFER IN A SUBHUMID REGION OF FRANCE,
M. A. Saint-Pe.
Ground Water, Vol 11, No 4, p 23-39, July-August 1973. 5 fig, 6 ref.

Descriptors: *Hydrogeology, *Groundwater resources, Water table, Groundwater movement, Water balance, Evapotranspiration, Recharge, Discharge (Water), Water yield, Drainage.
Identifiers: *Leaky aquifers, France.

The Arcachon Bay Plio-Quaternary aquifer, located in a flat poorly drained region of France, receives 1 m annual precipitation, and has a shallow water table. It is composed of a 50-100 m thick body of well-sorted clean sand and gravel which has excellent hydrodynamic properties and much fresh groundwater in storage. Leakage to the underlying Miocene aquifer, inferred from geologic and hydrogeologic observations, was calculated by water budgeting and Darcy's law to be on the order of 1.5 cu m/sec. This rate, about 15% of the annual precipitation, is nearly half the recharge rate to the Plio-Quaternary aquifer. Recharge amounts to more than 35% of the annual precipitation. The evapotranspiration rate, based on Thornthwaite's method, is more than 55% of the

annual precipitation. High recharge and evapotranspiration rates, a direct consequence of the relief, permeability of soils, and occurrence of hot summers, are coupled with a low surface runoff. The aquifer is excellent for irrigation and water-supply purposes. Drainage improvement is needed for extensive farming of the lands. (K-napp-USGS)

Identifiers: USSR, *Don River, Nomograms.

Data are presented on thermal properties of Don soils and on the phase composition of water in these soils in the frozen state. The process of infiltration is examined in terms of the mechanism of interaction of snowmelt with frozen soil, and the thermophysical method used to compute water losses to infiltration is reduced to practical use. In loam Chernozems of the Don River basin, intense phase transitions are generally observed at temperatures ranging from 0 to minus 3 deg C, while at temperatures below minus 5 deg C, the change in the ratio of ice to unfrozen water is negligible. At temperatures between minus 15 and minus 20 deg C, the amount of unfrozen water in Chernozems is 10%-16% of the weight of dry soil. (See also W73-12435) (Josefson-USGS)

Identifiers: USSR, *Valday Field Laboratory, *Transmission capacity.

Investigations were conducted at the Valday Field Laboratory in 1968-71 to measure infiltration and percolation of water into thawed and frozen sandy and Chernozem loam soils. Large infiltration and percolation values were recorded in experiments at temperatures ranging from minus 3.0 to 3.5 deg C in upper layers of a sandy soil wetted to minimum moisture capacity. Similar results were obtained in experiments with Chernozem loam soils at temperatures ranging from minus 2.2 to 2.4 deg C. The data obtained can be used to assess the importance of factors which determine infiltration capacity of soils. (See also W73-12435) (Josefson-USGS)

Identifiers: European USSR.

Fundamental principles for estimating absorptive capacity of watersheds were based on analysis of long-term observation data on components in the water balance of river basins in northwestern European Russia for fall, winter, and spring seasons of the year. Methods are proposed for forecasting water losses to basin recharge during periods of spring floods. The principles examined are generally applicable to other forested regions in the area. RESULTS OF A STUDY OF WATER REGIME OF SOILS ON SMALL WATERSHEDS IN THE DON RIVER BASIN (REZUL'TATY IZUCHENIYA VODNOGO REZHIMA POCHV MALYKH VODOSBOROV V BASSEYNE R. DONA),
Gosudarstvenni Gidrologicheskii Institut, Leningrad (USSR).
Ye. A. Leonov, and N. Ye., Leonova.
In: Voprosy formirovaniya vesennego polovod-'ya; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 194, p 133-154, Leningrad, 1972. 4 fig, 4 tab, 13 ref.

Descriptors: *Soil moisture, *Water storage, *Small watersheds, Moisture content, Snow surveys, Antecedent moisture content, Field capacity, Variability, Equations.
Identifiers: USSR, *Don River.

Studies were made of water regime of soils on small watersheds in the Don River basin to Kazanskaya Station between August 1969 and May 1971. Large temporal and spatial variability of soil moisture storage is due to a great diversity of physiographic conditions in the basin. Standard deviation of spatial variability of moisture storage in the top meter layer of soil for small watersheds of the Central Russian upland for winter and spring periods is 65-70 mm, and the coefficient of variation is 0.19-0.20. Standard deviation of spatial variability of soil moisture on 3-km snow courses with homogeneous soils is 15-20 mm, and the coefficient of variation is 0.04-0.07. For snow courses with heterogeneous soils, standard deviation is 25-77 mm, and the coefficient of variation is 0.06-0.21. The present basin network of 29 stations under supervision of the Administration of the Hydrometeorological Service of the Central Black Earth region does not provide for uniform distribution of stations for observation of major soil groups or for sufficiently accurate determination of average basin moisture storage. To improve the determination accuracy, soil moisture observations must be expanded to include villages of Russkaya Zhuravka, Istobnoye, Gremyach'ye, Demshinsk, Volchek, Terbuny, and Bogoyavlensk and towns of Bobrov, Georgiu-Dezh, and Zadonsk. In: Voprosy formirovaniya vesennego polovod-'ya; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 194, p 183-207, Leningrad, 1972. 3 fig, 13 tab, 15 ref.

Descriptors: *Soils, *Soil physical properties, *Hydrologic properties, *Bulk density, *River basins, Small watersheds, Soil moisture, Moisture content, Wilting point, Particle size, Porosity, Water storage, Chernozems, Forest soils, Grasslands.
Identifiers: USSR, *Don River, Hygroscopicity, Solonetzes.

To study hydrophysical properties of dominant and subsidiary soils in the Don River basin to Kazanskaya Station, 101 bulk-density determinations were made in 1969-71 at 44 stations in 8 small watersheds. Average bulk-density values for dominant soils increase in a southerly direction, with lowest values in the top-meter layer observed in podzolized and leached Chernozems and highest values in southern Chernozems. In each soil region, bulk density of the dominant soils is lower than bulk density of the subsidiary soils, the difference in the top-meter layer reaches 0.40-0.50 g/cu cm. Bulk-density values for gray and dark-gray Forest soils on Chernozem and for Chernozems beneath forest plantings differ little from

those for dominant soils of the corresponding region. (See also W73-12435) (Josefson-USGS)

METHODS OF DETERMINING SOIL MOISTURE STORAGE IN WINTER (K METODIKE OPREDELENIYA VLAGOZAPASOV POCHVY V ZIMNIY PERIOD GODA),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
L. K. Vershinina, and N. A. Ivanova.
In: Voprosy formirovaniya vesennego polovod-'ya; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 194, p 208-217, Leningrad, 1972. 4 fig, 2 tab, 9 ref.

Descriptors: *Soil moisture, *Water storage, *Winter, Moisture content, Field capacity, Bulk density, Water equivalent, Ice, Runoff, Frozen soils, Thawing, On-site investigations, Snow surveys.
Identifiers: USSR, *Bityug River.

Determinations of soil bulk density and moisture storage were based on data of on-site investigations by the State Hydrologic Institute in the Bityug River basin in Voronezh Oblast in the winter of 1968-69. Errors in the determination of moisture storage of frozen soils were estimated on the basis of bulk density of thawed soils. To determine moisture storage of frozen soils in the region, the relation of bulk density of thawed and frozen soils to moisture content should be used. (See also W73-12435) (Josefson-USGS)

TIME EFFECTS ON DYNAMIC SHEAR MODULUS OF CLAYS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
W. F. Marcuson, III, and H. E. Wahls.
J Soil Mech Found Div, Am Soc Civ Eng, Vol 98, No SM12, p 1359-1373, Dec 1972. 9 fig, 1 tab, 19 ref, 2 append

Descriptors: *Soil dynamics, Clays, Time, *Soil tests, Soil properties, Soil mechanics, Equations, Dynamics, Bibliographies.
Identifiers: *Shear modulus, Dynamic response, Dynamic tests, Test results.

The dynamic properties of soils are needed for computing response to seismic forces. A Hardin oscillator was used to apply a steady-state, torsional vibratory load to remolded specimens of kaolinite and calcium bentonite inside a triaxial chamber and under an isotropic consolidation pressure. Principles of the resonant column test were used to determine dynamic shear modulus. After completing primary consolidation, the response was studied as a function of time for both drained and undrained conditions. Regression analyses were performed on these data and relationships are presented that show the effects of void ratio, effective stress, and time on the dynamic response of the 2 clays. The shear modulus increases with: (1) increasing pressure, (2) decreasing void ratio, and (3) time, for both materials. This increase was approximately 5% for kaolinite and 25% for bentonite per logarithmic cycle of time after completion of primary consolidation in constant effective stress undrained tests. (USBR)

THEORY OF WATER MOVEMENT IN SOILS: 10. CAVITIES WITH CONSTANT FLUX,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia).
J-Y. Parlange.
Soil Science, Vol 116, No 1, p 1-7, July 1973. 14 ref.

Descriptors: *Soil water movement, *Pores, Porosity, Interstices, Mathematical studies, Equations, Porous media, Hydraulic conductivity, Diffusivity, Infiltration, Flow.

Analytical expressions are derived for the absorption of water from cylindrical and spherical cavities when the flux of water at the cavity is imposed. The solution reduces to the one-dimensional case in the short time limit. The soil around the cavity may become saturated; the growth of the saturated region with time is described. Correction terms due to gravity are also derived for the case of a spherical cavity. (See also W73-05099) (Knapp-USGS)

EFFECTS OF AIR GAPS AND SATURATED VOIDS ON ACCURACY OF NEUTRON MOISTURE MEASUREMENTS,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
B. Z. Richardson, and E. R. Burroughs, Jr.
U S For Serv Res Pap Int. 120. p 1-20. 1972. Illus.
Identifiers: *Air gaps, *Measurements, Moisture, Sand, Saturated, Voids, *Soil moisture.

The effects of voids on the accuracy of neutron soil moisture measurements in coarse and fine sand were investigated utilizing 2 25-cubic-foot plastic tanks. Test voids 3 inches and 6 inches in diameter and 10 inches long were cut from aluminum tubing and fastened to the neutron access tube in each tank. Voids in the control tank were filled with sand; those in the test tank were left empty. The amount of water which was added or subtracted was measured by weighing each tank. The difference in neutron measurements between the 2 tanks with the water at a given level measures the effects of the voids. A maximum error of +55% moisture by volume was caused by the large void in coarse sand with the void saturated; with the void drained, the error was -12.3% moisture. Errors in fine sand were slightly less than those in coarse sand; and errors due to the small void were about 1/3 the magnitude of errors due to the large void. Graphs were developed for use in estimating the size of voids adjacent to access tubes and in calculating the probable magnitude of measurement errors due to these voids when using field data.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF MOISTURE REGIME ON THE GENESIS OF LATERITE SOILS IN SOUTH INDIA: II. CLAY COMPOSITION AND MINERALOGY,
Indian Agricultural Research Inst., New Delhi.
A. S. Gowaikar.
J Indian Soc Soil Sci. Vol 20, No 1, p 59-66. 1972. Illus.
Identifiers: *Clay composition, Genesis, *India, Mineralogy, Soil moisture, Rainfall, *Soils (Laterite).

The chemical composition of the clay fractions indicates reduction in SiO2 and increase in Fe2O3 and Al2O3 with increase in rainfall. The clay minerals present are dominated by kaolinite under all moisture regimes. Quartz is also noted in small quantities in all clay fractions irrespective of the climatic conditions. Gibbsite occurs both in high and excessive rainfall groups. Laterization process is enhanced with high and excessive rains in 7 mo. having a K index > 1. With high rains distributed over a period of 9 mo., the laterization process is retarded. A dry spell of about 5 mo. (K index < 1) appears to be essential for laterization. P. G. Semikhnenko, and V. I. Kondrat'yev.
Pochvovedeniye, No 6, p 69-74, June 1972. 1 fig, 4 tab, 7 ref.

Descriptors: *Soil physics, *Soil water movement, *Soil moisture, *Chernozems, Capillary action, Diffusion, Evaporation, Water loss, Precipitation (Atmospheric), Soil management.
Identifiers: *USSR (Krasnodar Territory-Kuban').

Results are presented of experiments performed in the Kuban' region (Krasnodar Territory) in 1966-69 on low-humic, thick-leached Chernozems formed on calcareous loesslike loam. The capillary rise of water to the surface of this soil does not compensate for water losses through evaporation. Capillary flow to the soil surface is observed only during the first days of spring and after abundant precipitation when soil water content approaches minimum moisture capacity. The upper (2-4 cm) layer of well-structured soils dries rapidly to discontinuous capillary moisture or less and acts as a mulch. From the first days of spring the evaporation zone moves downward, and water losses during the presowing period are determined mainly by vapor migration through diffusion. (Josefson-USGS)

Pochvovedeniye, No 6, p 57-68, June 1972. 2 fig, 7 tab, 8 ref.

Descriptors: *Soil physical properties, *Hydrologic properties, *Chernozems, *Rotations, *Field crops, Crop production, Plant growth, Soil-water-plant relationships, Root zone, Soil water, Soil moisture, Available water, Permeability, Evapotranspiration, Water loss, Clays, Loam, Particle size.
Identifiers: *USSR (*Crimea).

For many years technologically advanced kolkhozes and sovkhozes in the Crimea have obtained high yields of winter wheat and barley, amounting to 35-45 cntr/ha. To determine the causes of these yields, investigations were carried out in 1966-69 to study hydrophysical properties and moisture conditions of southern Chernozems in the Crimean piedmont-steppe zone. These soils have a high moisture capacity and permeability, a high available-water content (300-360 mm in the 0- to 200-cm layer), and a relatively high content of water-stable aggregates. Agroclimatic conditions contribute to deep soil wetting in fall and winter (to a depth of 200 cm or more). Loss of soil water by evaporation is high (5.2 to 7.4 mm/day), especially in summer when soil water content is optimal and plant growth is intense. Evaporation from bare soil may reach 1.3 mm/day. Total loss of water by field crops may exceed soil evaporation fivefold to sixfold. (Josefson-USGS)
W73-12744

WATER REGIME IN A CROP ROTATION ON CHERNOZEM SOILS IN SOUTHEAST RUSSIA (VODNYY REZHIM V SEVOOBOROTE NA CHERNOZEMNYKH POCHVAKH YUGO--VOSTOKA),
A. M. Byalyy.
Gidrometeoizdat, Leningrad, 1971. 232 p.

Descriptors: *Soil water movement, *Soil moisture, *Chernozems, *Rotations, *Soil-water-plant relationships, Soil management, Soil temperature, Root zone, Available water, Evapotranspiration, Wilting point, Water utilization, Water loss, Water supply, Water balance, Precipitation (Atmospheric), Condensation, Snow, Runoff, Shelterbelts.
Identifiers: *European USSR, Hygroscopicity.

Water regime of Chernozem soils in southeastern regions of European Russia was investigated for relationships between incoming and outgoing items in the water balance and for characteristics of water supply and use as they affect plant growth in different crop rotation fields. Studies are made of soil moisture conditions in forests, shelterbelts, and open fields between trees, and principal factors in the regulation of the water regime of Chernozems are described. A comprehensive bibliography of Soviet references is supplied. (Josefson-USGS)

DETERMINATION OF EXCHANGEABLE CATIONS IN CALCAREOUS SOILS,
Centro de Edafologia y Biologia Aplicada del Segura, Murcia (Spain).
O. Carpena, A. Lax, and K. Vahtras.
Soil Science, Vol 113, No 3, p 194-199, March 1972. 3 fig, 2 tab, 6 ref.

Descriptors: *Cation exchange, *Calcareous soils, *Calcium carbonate, *Magnesium carbonate, *Alkaline earth metals, Soil analysis, Soil chemistry, Soil investigations, Leaching, Solvent extractions.
Identifiers: *Spain (Murcia).

This investigation attempted to eliminate solubilization of carbonates as a source of interference in the determination of exchangeable cations in calcareous soils. All procedures for determining exchangeable cations in calcareous soils have the problem of interference of alkali-earth metals dissolved from carbonates, which are exchangeable cations. In 1953, Mehlich introduced a procedure which determines the exchangeable cations in calcareous soils by measuring the calcium and magnesium dissolved from soil carbonates when the soils were extracted with reagents. This procedure is most appropriate for these soils, because the solubility of carbonates is lower in this extractant than in any other. The results are amply supported with tables and graphs. (Bahre-Arizona)

LEACHING SALTY SOILS,
Central Soil Salinity Research Inst., Karnal (India).
I. P. Abrol, and D. R. Bhumbla.
Indian Farming, Vol 22, No 1, p 10-11, 1972. 4 fig.

Descriptors: *Leaching, *Gypsum, *Permeability, *Land forming, *Saline soils, Drainage, Ponding, Farm ponds, Root zone, Soil moisture, Soil amendments, Crop response, Alkaline soils.
Identifiers: *India (Haryana-Punjab-Pradesh).

Uncultivated lands in the states of Haryana, Punjab and Uttar Pradesh in India, contain excess salts and sodium, and unless removed from the soil, crop response is likely to be poor. The ideal method for removal of salts is to provide drainage in the root zone so that salts can be removed by a drainage system to the sea. Leaching of salts to lower soil layers can be accomplished by ponding water on the soil surface preceding the rainy season. This is the time when maximum salts are on the soil surface and the groundwater table is deepest. The relatively dry soil ensures a high level of soil permeability so that water is not lost by evaporation. Impermeable soils are aided by the addition of gypsum which facilitates water penetration and therefore salt leaching. It is suggested for this area that nearby canal water be used because of its good quality, and if not available, tubewells should be installed. (Bahre-Arizona)

AUGER SOIL SAMPLER FOR HERBICIDE RESIDUES,
Agricultural Research Service, College Station, Tex. Plant Science Research Div.
T. O. Flynt, T. E. Riley, R. W. Bovey, and R. E. Meyer.
Weed Science, Vol 19, No 5, p 583-587, September 1971. 2 fig.

Descriptors: *Sampling, *Soil moisture, *Soil analysis, *Herbicides, Soil investigations, *Instrumentation, Soil tests, *Texas, Soil types.

A soil sampler was constructed for moisture and pesticide residue determinations that will retrieve soils with rocky and heavy clay layers from Texas rangeland. A commercially constructed worm-gear driven auger was mounted in a 3.7-m-tall vertical rectangular frame supported by a 4.6-m-long A-frame attached to the rear bumper of a truck. A cable attached from the bed of the truck to the top of the frame permits the entire assembly to be raised off the ground with a hand lift hoist when moving from plot to plot. The power unit for the auger was suspended halfway from the A-frame with a flat metal bar. A cable from this suspension bar to a guide platform on the vertical frame prevents any stress on the flexible shaft from the motor to the worm gear drive on the auger. The depth, speed, accuracy and ease of sample retrieval were substantially increased, compared to manual sampling. (Gloyd-Arizona)

SODIUM-AFFECTED SOILS IN THE JORDAN VALLEY,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Div. of Soil Physical Chemistry.
N. Alperovitch, and J. Dan.
Geoderma, Vol 8, No 1, p 37-57, August 1972. 5 fig, 24 ref.

Descriptors: *Water table, *Water levels, *Soil types, *Saline soils, *Alkaline soils, Aeolian soils, Alluvium, Bogs, Soil tests, Salts, Sodium, Soil classification, Groundwater availability, Leaching, Precipitation (Atmospheric).
Identifiers: *Jordan Valley.

Formation of fine-textured aeolian, alluvial and swampy soils, found both on the present depositional surfaces and the older dissected terrace, is presented to illustrate in part the quaternary history of the region. High water tables affect the salinity and high levels of exchangeable sodium in soils, while some older soils are believed to have been subject to prolonged deposition of airborne salts. In the northern part of the Jordan valley, four soils are common: (1) soils with high groundwater table with the highest concentration of salts and exchangeable sodium in the upper layers; (2) soils with a somewhat deeper water table where the high salinity and alkalinity are in deeper layers; (3) soils which had high groundwater tables in the past, but which have been leached to some extent; and (4) soils which did not have a high water table, but nevertheless are alkaline, also somewhat saline in the deeper layers. The aforementioned soils, except (1) have been subject to some leaching. In the southern part of the valley, most of the soils are highly saline, and the low rainfall precludes natural leaching. Major characteristics of the soils are related to high salinity and high levels of exchangeable sodium. (Bahre-Arizona)

THE EFFECT OF SOIL TEMPERATURE ON PLANTS GROWN IN SALINE SOIL,
Hebrew Univ., Rehovot (Israel). Dept. of Soil Science.
S. Ravikovitch, and J. Navrot.
Soil Science, Vol 113, No 6, p 431-439. 1972. 5 fig, 1 tab, 17 ref.

Descriptors: *Soil temperature, *Saline soils, *Plant growth, Soil tests, Temperature control, Nutrient requirements, Soil-water-plant relationships, Field crops, Phosphorus, Nitrogen, Soil treatment, Soil moisture.

Saline and nonsaline soils and phosphorus fertilization were used in a study of the influence of soil temperature on growth. Soil temperatures were maintained by placing pots in thermostatically controlled water baths at ambient temperatures, 15, 25, 35, and 43C. The experiment also included nutrient treatments in which nitrogren was kept constant for each crop with various levels of phosphorus being applied. Potassium was given at a constant rate in all treatments. The effect of soil temperature was most marked in plants grown in nitrogen-phosphorus-treated soils. Growth was especially stimulated by NP treatments with a high P level. Optimum soil temperature for plant growth was 25C for clover, 35C for corn. For millet it was 35C in saline soil and 43C in nonsaline soil. At all soil temperatures, the Cl content of plants growing in saline soils decreased with an increase in the P application. With increasing salinity, there was an increase in plant phosphorus content. (Bahre-Arizona)

MORPHOLOGY, GENESIS, OCCURRENCE AND AGRICULTURAL POTENTIAL OF ACID SULPHATE SOILS IN CENTRAL THAILAND,
Food and Agriculture Organization of the United Nations, Bangkok (Thailand). Soil Survey Land Classification Project.
W. Van Der Kevie.
Thai J Agric Sci. Vol 5, No 3, p 165-182, 1972, Illus.
Identifiers: *Acid soils, Agricultural, Genesis, Morphology, Soils, *Sulfate soils, *Thailand.

An area of 800,000 ha consists of acid sulfate soils. They are poorly drained, strongly acid, heavy clay soils, and subject to prolonged flooding during the rainy season. The classification of these soils is discussed. A brief outline of the formation of the marine and brackish water sediments and their approximate age, determined by C 14 dating methods, is given. Soil profile development of younger and older acid sulfate soils is described. The soil potential for agriculture is discussed and possible ways of improvement of these soils are indicated.--Copyright 1973, Biological Abstracts, Inc.

WATER VAPOR ADSORPTION BY WATER--REPELLENT SOILS AT EQUILIBRIUM,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
S. Miyamoto, J. Letey, and J. Osborn.
Soil Sci, Vol 114, No 3, p 180-184, 1972, Illus.
Identifiers: *Adsorption (Soils), Equilibrium, Repellents, Soils, Temperature, *Water vapor, Wettability, Surface tension.

Water vapor adsorption by soil and sand samples which have different surface tensions were examined at equilibrium under a controlled temperature of 30 plus or minus 0.5C. No specific trend or differences which could be uniquely related to repellency were found on the amount adsorbed/unit area, the shape of adsorption isotherm, the heat of adsorption and the integral free energy of adsorption. The differences in initial vapor adsorption levels under the controlled temperature did not influence the measurable value of the surface tension and consequently repellency of the samples used. Adamson's method to determine the equilibrium contact angle and the spreading coefficient by adsorption isotherm alone appeared not to apply for porous media. The apparent independence of water vapor adsorption upon the differences in surface tension of porous media implied that mechanisms of wettability and repellency of porous media may be occurring at the portion which is beyond the vapor adsorption or masked by other soil properties.--Copyright 1973, Biological Abstracts, Inc.

EDAPHIC AND WATER RELATIONSHIPS OF ALDICARB AND ITS METABOLITES,
North Dakota State Univ., Fargo. Dept. of Entomology.
M. S. Quraishi.
Can Entomol. Vol 104, No 8, p 1101-1196. 1972. Illus.
Identifiers: *Aldicarb, *Edaphic relationships, Light, Metabolites, Potatoes, Roots, Storage, Sun, Temperature, Sugarbeets.

Laboratory investigations were made to determine the persistence of aldicarb and its metabolites in soil (clay loam pH 6.8-7.2) and in water collected from fields. At dose rates of 15 and 20 ppm, aldicarb was not detectable in soil after 8 and 12 wk, respectively. At 50 ppm, after 11 wk chemically detectable amounts of the insecticide were present in the soil. Soil samples were stored between 23 and 28C but temperature at times reached 32C. In field water treated in the laboratory at 100 ppm of aldicarb, the chemical and its metabolites were detectable at 0.4 ppm 11 mo. later. Water was stored at 16-20C and was exposed for 507.5 hr to sunlight. Aldicarb was eluted readily with water from soil columns. When aldicarb was applied as side dressing at the time of planting of sugarbeet roots and potatoes, residues of less than 0.05 ppm were found in soil and potatoes at harvest. One sugarbeet root sample contained 0.2 ppm of the chemical and its metabolites.--Copyright 1973, Biological Abstracts, Inc.

INVESTIGATIONS ON AMERICAN SHAD IN THE ST. JOHNS RIVER,
R. O. Williams, and G. E. Bruger.
Fla Dep Nat Resour Mar Res Lab Tech Ser. 66. p 1-49. 1972. Illus.
Identifiers: Alosa-Sapidissima, *American shad, Crustaceans, *Florida (St. Johns River), Growth, Insects, Rivers, Shad, *Spawning.

A study of American shad, Alosa sapidissima (Wilson), in the St. Johns River was conducted to determine the spawning grounds, movement, growth, and food habits of juveniles, and to evaluate effects of the fisheries and proposed environmental alterations on the populations. Spawning grounds were located by collecting free-drifting, demersal shad eggs in plankton nets set along the river bottom. Spawning began at Crows Bluff west of DeLand and extended south about 100 mi to USA Highway 192 west of Melbourne, but most spawning occurred between Lakes Monroe and Poinsett. Importance of the spawning area between Lakes Harney and Poinsett increased during low water when there was little current in the area north of Lake Harney. Eggs were generally collected over clean sand bottom of less than 4 m depth and in current of 1-1 1/2 ft/sec. Juvenile movement and growth were determined by monthly collections of young shad with beach seines, plankton nets, and trawls. Movement pat-

terns were related to current and water temperature with downstream movement from spawning grounds to nursery area occurring as water temperatures increased in spring, and emigration from the river occurring when temperatures dropped in late autumn. Growth was more rapid during the 1970 season. Juveniles collected emigrating from the river in 1969 ranged from 69-110 mm FL (fork length). Young shad fed primarily on crustaceans and insect larvae; crustaceans were the dominant food type. Commercial and sport fisheries have changed significantly from accounts given by previous investigators. Production of both fisheries has declined in recent years. Gill nets are the primary commercial gear; haul seines are nearly defunct. There is some evidence of overfishing, especially of female shad. Proposed upper river alterations such as the St. Johns-Indian River Canal and water control projects by the Central and Southern Florida Flood Control District are discussed and evidence is presented that they may reduce future shad runs by eliminating and/or degrading sections of spawning area between Lakes Monroe and Poinsett.--Copyright 1972, Biological Abstracts, Inc.

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY7, Paper 9855, p 1083-1096, July 1973. 9 fig, 14 ref, append.
NSF Grant GK-23992.

Descriptors: *Water circulation, *Lakes, *Finite element analysis, *Lake Ontario, Equations, Mathematical models, Numerical analysis, Currents (Water), Flow.

A finite element formulation is given for the analysis of the wind-driven circulation of homogeneous variable-depth, shallow lakes. The method of weighted residuals is used to transform the governing differential equation to an integral form which in turn is approximated by linear stream function fields in triangular elements. Numerical results are presented for a rectangular basin and for lake Ontario. (Knapp-USGS)

THE FOOD AND FEEDING HABITS OF THE SMALL MORMYRID FISHES OF LAKE VICTORIA, EAST AFRICA,
East African Freshwater Fisheries Research Organization, Jinja (Uganda).
J. Okedi.
Afr J Trop Hydrobiol Fish. Vol 1, No 1, p 1-12. 1971. Illus.
Identifiers: Chironomid, *East Africa feeding habits (Fish), *Fish food, Gnathonemus-Longibarbis, Gnathonemus-Victoriae, Habits, Lakes, Marcusenius-Grahami, Marcusenius-Nigricans, Mormyrid, Petrocephalus-Catostoma, Povilla, *Lake Victoria.

The feeding habits of Gnathonemus longibarbia, G. victoriae, Marcusenius grahami, M. nigricans and Petrocephalus catostoma including the feeding requirements of both adults and immature fish in affluent rivers and swamp pools where spawning takes place were investigated. Seasonality of accumulation of abdominal fat reserves and intensified periods of feeding activity during sexual quiescence contrasted with lessened feeding activity during breeding periods in adult fishes. The quantity of Chironomid and Povilla larvae, which formed the chief food, in the stomachs of the Mormyrids, appeared to be correlated with certain lunar phases.--Copyright 1973, Biological Abstracts, Inc.

THE LAKE CHILWA TILAPIA AND ITS FISHERY,
Chancellor Coll., Limbe (Malawi).
P. R. Morgan.
Afr J Trop Hydrobiol Fish. Vol 1, No 1, p 51-58. 1971. Illus.
Identifiers: Barbus-Paludinosus, Clarias-Mossambicus, *Fishery, Lakes, *Malawi, Tilapia, Tilapia-Shirana, *Lake Chilwa.

Lake Chilwa, a shallow tropical lake in southern Malawi, experiences considerable fluctuations in water level which seriously affect its fishery. Particular attention is drawn to the effects of water level upon the endemic Tilapia shirana chilwae. When the lake level falls drastically, Tilapia is usually the first important commercial fish to suffer, with mass mortalities being recorded on several occasions. Barbus paludinosus, another important species is similarly affected, but the catfish Clarias mossambicus is very resistant to periods of low water. The history of the Tilapia fishery passed through several phases. Between 1960 and 1965 fish exports rose, then declined between 1965 and 1968 when the lake became dry, followed by another rise after 1968 when the lake was reflooded. The instability of the lake and its fishery will probably persist. Schemes for maintaining a more consistent output of fish are discussed.--Copyright 1973, Biological Abstracts, Inc.

THE SIZE AT MATURITY AND BREEDING SEASONS OF SARDINES IN SOUTHERN LAKE TANGANYIKA,
C. M. A. Ellis.
Afr J Trop Hydrobiol Fish. Vol 1, No 1, p 59-66. 1971. Illus.
Identifiers: *Breeding, Lakes, Limnothrissa-Miodon, *Maturity, *Sardines, Seasons, Size, Stolothrissa-Tanganicae, *Lake Tanganyika.

Stolothrissa tanganicae and Limnothrissa miodon showed a marked seasonal shift in the size at which they first became mature, this being lowest during their main breeding seasons. Stolothrissa females were first mature at an annual mean of 75 mm fork length and the males at 70 mm. Limnothrissa females reached maturity at 75 mm and the males at 64 mm. Mature Stolothrissa were found throughout the year with a peak of activity in the dry season between April and July, and during the wet season in Dec.-Jan. Linnothrissa with active gonads were found in Dec.-May with a distinct breeding peak during March-May and Dec.-Jan. Two sampling localities approximately 60 km apart appeared to support different Stolothrissa populations.--Copyright 1973, Biological Abstracts, Inc.

LAKE MOVEMENTS WITH PARTIAL ICE COVER,
Ontario Water Resources Commission, Toronto.
M. D. Palmer, and J. B. Izatt.
Limnol Oceanogr. Vol 17, No 3, p 403-409. 1972. Illus.
Identifiers: *Canada, Currents, *Ice cover, Lakes, Temperature, *Lake Erie.

A recording current meter was operated under a winter ice sheet at Nanticoke, Lake Erie, in 11 m of water at a depth of 3 m from the bottom. Current magnitude and direction and water temperature were measured every 10 min. Current magnitudes up to 1 mo. after the ice sheet formed were similar to measurements made without ice; autovariance density spectra for this period showed energy concentrations at frequencies corresponding to the free oscillation modes of Lake Erie. Several months after the ice had been in place the measured currents were half as fast (3-9 cm/sec) and spectra during this period showed no energy concentrations at Lake Erie oscillation frequencies.--Copyright 1973, Biological Abstracts, Inc.

RADIATION REGIME OF LAKE CHELKAR AND ADJOINING REGIONS (O RADIATSIONNOM REZHIME OZERA CHELKAR I PRILEGAYUSHCHEY K NEMU TERRITORII),
L. S. Aleksandrova.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya, Vol 105, No 1, p 56-61, January-February 1973. 5 fig, 8 tab, 5 ref.

Descriptors: *Lakes, *Radiation, Albedo, Cloud cover, Surfaces, Curves.
Identifiers: *USSR (Aktynbinsk Oblast), *Lake Chelkar.

Radiation regime of Lake Chelkar in the Aktyubinsk Oblast was investigated in actinometric observations performed by the USSR Academy of Science's Laboratory of Limnology in July-August 1965. Daily total radiation values for the lake varied between 359 and 700 cal/sq cm in July and between 254 and 625 cal/sq cm in August. Daily total radiation values for land areas varied between 354 and 703 cal/sq cm in July and between 266 and 638 cal/sq cm in August. Radiation absorbed at the lake's surface was 17.5 kcal/sq cm in July and 15.0 kcal/sq cm in August, while the radiation absorbed at the earth's surface during these periods was 14.3 kcal/sq cm and 12.4 kcal/sq cm, respectively. The portion of radiation absorbed by the lake was 96% and that absorbed by the earth's surface was 70%. Differences in albedo values for lake and earth surfaces are appreciable, amounting to 14%-15%. (Josefson-USGS)

INVESTIGATION OF LAKE-LEVEL FLUCTUATION PATTERNS AND MOISTURE CONDITIONS IN THE MIDDLE AND SOUTHERN URALS (ISSLEDOVANIYE ZAKONOMERNOSTEY KOLEBANIY UROVNYA OZER I UVLAZHNENNOSTI SREDNEGO I YUZHNOGO URALA),
M. A. Andreyeva.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya, Vol 105, No 1, p 51-56, January-February 1973. 4 fig, 4 ref.

Descriptors: *Lakes, Water levels, Water level fluctuations, *Moisture, *Mountains, Air circulation, Cycles, Correlation analysis, Regression analysis, Curves, Equations.
Identifiers: USSR, *Urals.

Clearly expressed 20-25 year cycles are observed in lake-level fluctuations in the Urals. The rising stage lasts 6-7 years, the period of unsteady maximum, 3-4 years, and the declining stage, 10-12 years. Long-term lake-level fluctuations correlate closely with meteorological conditions and especially with total moisture. Average duration of low stages is 12-13 years in the Transurals and 10-12 years in the Cisurals. High stages are of shorter duration, lasting an average of 7-9 years. Coefficients of low stages vary between 0.6 and 0.9 and decrease toward the south and southeast. Coefficients of high stages vary between 1.2 and 2.0, reaching maximum values in the forest-steppe zone of the Transurals. (Josefson-USGS)

MEASUREMENT OF CURRENTS IN THE GREAT LAKES,
Ministry of the Environment, Ottawa (Ontario).
M. D. Palmer.
International Field Year for the Great Lakes Technical Manual Series No 3; Canadian National Committee for the International Hydrological Decade, Ottawa, Canada, 1972. 32 p, 12 fig, 7 plate, 41 ref, 2 append.

Descriptors: *Great Lakes, *Current meters, *Instrumentation, Water measurement, Data collections, Tracers, Water circulation, Limnology, Currents (Water), Telemetry, Remote sensing, Aerial photography.

This manual is directed toward some of the problems encountered in Great Lakes current measurements. Currents can be measured by either placing a current meter at a fixed point, or by tracking the movement of a free object as it is carried by the water. The fixed meter, or Eulerian technique, is particularly useful for the study of the dynamics of water movement. The free-drifter, or Lagrangian technique, is most useful for the study of diffusion and mass transport. To calculate the mean mass flux past a given Eulerian observing station it is necessary to add an additional term, the Stokes Velocity, which depends on the time and distance scales of the fluctuating currents, and may not apply to the shallow nearshore waters. The relation between the mean velocities observed by the two techniques is 3 lagrange ± Euler and Stokes. In general, meters can be classified as to whether or not they record internally, and by the type of current sensor (transducer) used in the device. Lagrangian measurements are historically the oldest type of measurements. In general they consist of tracing the movement of some identifiable marker that is transported by currents. These direct measurements of particle movement are important for determining the characteristics of dispersion or movement of material discharged into a lake. (Knapp-USGS)

EXPLORATORY BOTTOM TRAWLING IN LAKE VICTORIA,
Food and Agriculture Organization of the United Nations, Jinja (Uganda). Lake Victoria Fisheries Research Project.
E. Bergstrand, and A. J. Cordone.
Afr J Trop Hydro-Biol Fish. Vol 1, No 1, p 13-23. 1971. Illus.
Identifiers: Bagrus-Docmac, Bottom trawling, Clarias-Mossambicus, *Haplochromis, Lakes, Protopterus-Aethiopicus, Tilapia-Esculenta, *Trawling, *Lake Victoria.

The first lakewide exploratory bottom-trawl survey of Lake Victoria was initiated in Sept. 1968 and terminated in May 1970. Gear experimentation was completed in 1968 and fullscale fishing started in Jan. 1969. Excluding the experimental phase; 841 drags were made which yielded 272,980 kg of fish. Total trawling time was 1117 hr and the distance covered by the trawl approximated 6209 km. The overall hourly catch rate was about 244 kg. Codends of various mesh sizes were employed but the 2 sizes used most often measured 6.4 and 3.8 cm (stretch measure). Catch rates were inversely correlated with mesh size. The catch was dominated by Haplochromis species which constituted 54.3% by weight of the total. Bagrus docmac contributed 11.7% and Clarias mossambicus 10.4%. Other important species weightwise were Protopterus aethipicus and Tilapia esculenta. Species hourly catch rates and percentage frequency of occurrence are presented for each of the 8-10-m depth intervals.–Copyright 1973, Biological Abstracts, Inc.

AGE, GROWTH REPRODUCTION, AND FOOD OF THE BURBOT, LOTA LOTA (LINNAEUS), IN SOUTHWESTERN LAKE SUPERIOR,
Fish and Wildlife Service, Ashland, Wis.
M. M. Bailey.

Trans Am Fish Soc. Vol 101, No 4, p 667-674. 1972. Illus.
Identifiers: Age, *Burbot, Food, Growth, *Lake Superior, Lota-lota, Mysis, Pontoporeia, Reproduction.

This study was based on 1285 L. lota collected in 3 areas in southwestern Lake Superior in 1966-69. Age was determined from otoliths, the marginal zones of which were opaque from Dec. to May and translucent from June to Nov. Average lengths of the age groups and annual increments were measured from a curve fitted by inspection to point estimates of lengths at capture. Burbot grew 5.7 in during the first yr of life and 4.3 in during the second. Later annual increments through the 12th yr ranged from 1.2 to 2.6 in. Average total lengths and calculated weights were 16.1 in and 1.1 lb at age V and 23.4 in and 3.2 lb at age X. First maturity was at age I, at a total length of 9.7 in for males and 10.7 in for females; all fish were mature at age V and at lengths greater than 16.4 in (males) and 15.9 in (females). Most burbot collected near shore in the Apostle Islands area in late Jan. and Feb. were spent, but none collected in offshore areas during Jan. and March had spawned. The estimated number of eggs in the ovaries of 8 burbot 14.7-21.3 in long ranged from about 268,800 to 1,154,000 and averaged about 812,300. Burbot of all sizes fed on fish and crustacenas. Fish heavily predominated in the food of large burbot taken during the winter (99.6% of the volume) but crustaceans (Mysis and Pontoporeia) became increasingly important during the summer and fall (when they contributed more than 73% of the volume). Due to the wide variety and large volume of food consumed, the burbot is probably a significant competitor of many other species.--Copyright 1973, Biological Abstracts, Inc.

THE SEASONAL ABUNDANCE OF THE ANCYROCEPHALINAE (MONOGENEA) ON LARGEMOUTH BASS IN WALTER F. GEORGE RESERVOIR,
Georgia Univ., Athens. School of Forest Resources.
M. V. Rawson, and Wilmer A. Rogers.
Proc Helminthol Soc Wash. Vol 39, No 2, p 159-162. 1972. Illus.
Identifiers: Abundance, Actinocleidus-Fusiformis, Ancyrocephalinae, Bass, Clavunculus-Bursatus, *Largemouth bass, *Monogenea, Reservoirs, Seasonal, Temperature, Urocleidus-Furcatus, Urocleidus-Principalis.

Four species of Ancyrocephalinae were collected from largemouth bass in Walter F. George Reservoir from Dec. 1967 to Jan. 1969. The abundance of Urocleidus principalis and U. furcatus peaked at 28 C in June and mid-Sept., declined in the early fall, and then rose to another peak in Dec. at 9 C. The abundance of Actinocleidus fusiformis peaked prior to the spring period of maximum temperature change in June and mid-Sept. at 28 C and in Dec. at 9 C. Abundance of Clavunculus bursatus peaked in the early spring and late fall at 9 C. The peaks of abundance seemed to be a water temperature-associated phenomenon.--Copyright 1973, Biological Abstracts, Inc.

RESISTANCE IN DIGITARIA TO YELLOW SUGARCANE APHID, SIPHAFLAVA (FORBES) AS RELATED TO TEMPERATURE AND RAINFALL,
Agricultural Research Service, Beltsville, Md. Plant Science Research Div.
A. J. Oakes, and A. Sierra-Bracero.
J Agric Univ P R. Vol 56, No 1, p 33-38. 1972.
Identifiers: *Aphids (Yellow sugarcane), *Digitaria, *Rainfall, Sipha-Flava, *Temperature, Differential resistance, Insects.

Differential resistance to yellow sugarcane aphid, Siph flava, exists among Digitaria species. Differential resistance among species is expected on the basis of interspecific variation. Differential resistance to aphid damage exists among clones within species. Differences in insect resistance among clones within species are expected on the basis of intraspecific variation. Clones superior to insect resistance were delineated in this trial. The superior performance of phenotypes within species is masked by the average performance of the species. Significant negative correlations were found between insect resistance ratings and the number of rainy days and average temperature during a 28 day interval prior to rating. A model was calculated for the average behavior of species; it included infestation expected on the basis of the number of rainy days and average temperature during the 28-day interval before rating. The model accounted for approximately 66% of the variability present.--Copyright 1973, Biological Abstracts, Inc.

GREEN SNOW AND ICE FROM THE ANTARCTICA,
National Museum of Natural History, Budapest (Hungary).
E. Kol.
Ann Hist Natl Hung. 63: p 51-56. 1971. Illus.
Identifiers: *Algae, *Antarctica, Bracteococcus-Minor-Var-Glacialis, Chlamydomonas-Ballenyana-Var-Minor, Ice, Seston, *Snow.

Six green algal species, deriving from green snow and ice samples collected by Professor P. M. Arnaud on Terre Adelie, Antarctica, are discussed; the predominating taxa are Bracteococcus minor var. glacialis Flint, and Chlamydomonas ballenyana var. minor var. nova. An alga diagram shows also the quantitive occurrence of the microorganisms of the cryoseston. A review and comparison of the green cryosestons published from the Antarctica are also given.--Copyright 1973, Biological Abstracts, Inc.

WATER PATHWAYS IN HIGHER PLANTS: II. WATER PATHWAYS IN ROOTS,
Southampton Univ. (England). Dept. of Botany.
T. W. Tanton, and S. H. Crowdy.
J Exp Bot. Vol 23, No 76, p 600-618. 1972. Illus.
Identifiers: *Carrots, Plants, *Roots, *Wheat.

The technique for studying the pathways of water movement was applied to the transpiration stream in the roots of higher plants. Free space was confined to the cell walls except in flooded tissue where intercellular spaces were also included. Errors involved in free-space estimates were discussed and free-space volumes of 5.4% were obtained for wheat root cortex and 4.1% for carrot xylem parenchyma. The main water-absorbing regions of roots begin immediately behind the elongating zone, where the first xylem elements are fully differentiated, and end when the endodermis undergoes secondary wall development. In the cortex the transpiration stream is located mainly in the cell wall. Calculations indicate that the symplastic pathway is of only minor importance in transpiring plants. At the endodermis the free-space pathway is blocked by the Casparian strip and all water and solute entering the stele must pass through the lumen of the endodermal cells. The permeability of individual endodermal cells varies considerably both between cells of the same species and between those of different species. Once inside the endodermis, the transpiration stream returns to the cell-wall pathway until it reaches the xylem vessels where it enters the lumen of the mature xylem elements. WATER PATHWAYS IN HIGHER PLANTS: III. THE TRANSPIRATION STREAM WITHIN LEAVES,
Southampton Univ. (England). Dept. of Botany.
T. W. Tanton, and S. H. Crowdy.
J Exp Bot. Vol 23, No 76, p 619-625. 1972. Illus.
Identifiers: Bean, *Chelates, Laurel, Lead, *Leaves, Plantain, Plants, Stream, *Transpiration, Wheat.

Water in the transpiration stream is distributed throughout the leaves in the vascular bundles. In wheat, water appears to be confined to the main veins by the mestome sheath and to enter the mesophyll through the walls of the smaller veins. Within the mesophyll the water in the transpiration stream moves in the free space of the cell walls to the evaporating surfaces of the leaf. The lead chelate, which is used to trace the transpiration stream, accumulates at the final points of evaporation at the margin of the leaf. Lead chelate accumulates beneath and on the surface of the cuticle, being partly associated with the anticlinal walls of the epidermal cells, the walls of the stomatal guard cells and specialized epidermal cells. Chelate does not accumulate at the base of substomatal cavities, indicating that the cuticle of the epidermis is the main evaporating surface of the leaf. The behavior in broad bean, laurel, and plantain is essentially the same. The rate of peristomatal and cuticular transpiration is closely related to the size of the stomatal aperture. Conditions which control stomatal aperture also cause changes in the dimensions of the epidermal cells. (See also W73-12651)--Copyright 1973, Biological Abstracts, Inc.

BOTANY ALONG SONAMARG TO TRUNKHAL,
Sri Pratap Coll., Srinagar (India). Dept. of Botany.
K. A. Malik, and G. Singh.
Kashmir Sci. Vol 7, No 1/2, p 82-88. 1970. Illus.
Identifiers: *Botany, Climates, *India, Kashmir, Soils, Sonamarg, Species, Trunkhal, Vegetation.

The botanical tour undertaken in June, 1969 in N. E. Kashmir from Sonamarg to Trunkhal is described. The tract covered is 96 km long, wholly mountainous and surrounded by mountain ranges of considerable heights with snow-covered peaks. A complete physical description of this site is given as to snow cover, rainfall, soil types, and the location of alpine meadows and bodies of water. The distribution of vegetation is given as well as an enumeration of the plant species found.--Copyright 1973, Biological Abstracts, Inc.

WATERFOWL UTILIZATION OF BEAVER PONDS IN NEW BRUNSWICK,
New Brunswick Univ., Fredericton. Northeastern Wildlife Station.
R. N. Renouf.

J Wildl Manage. Vol 36, No 3, p 740-744. 1972. Illus.
Identifiers: Anas-Carolinensis, Anas-Platyrhynchos, Anas-Rubripes, Aytha-Collaris, Bucephala-Clangula, *Canada (New Brunswick), Castor-Canadensis, Lophodytes-Cucullatus, Ponds, *Waterfowl.

Waterfowl utilization of 41 beaver ponds in south-central New Brunswick was studied during 1969. Ponds occupied by beaver (Castor canadensis), temporarily or during the entire field season, were defined as active. There were 15 active and 26 inactive ponds. Black ducks (Anas rubripes) comprised 27 of the 47 broods observed. In addition, green-winged teal (A. carolinensis), hooded merganser (Lophodytes cucullatus) ring-necked duck (Aythya collaris), common goldeneye (Bucephala clangula), and mallard (Anas platyrhunchos) broods were seen. Thirty-eight broods were sighted on active ponds and only 9 on inactive ponds. Active ponds contained 0.75 brood/acre and inactive ponds 0.11 brood/acre. The seasonal drop of the water level was less in active ponds than in inactive ponds. Hence, brood cover was more abundant in active ponds, and the active ponds were better brood-rearing areas.--Copyright 1973, Biological Abstracts, Inc.

WATER TEMPERATURE AND THE MIGRATIONS OF AMERICAN SHAD,
McGill Univ., Montreal (Quebec). Dept. of Biology.
W. C. Leggett, and R. R. Whitney.
U S Natl Mar Fish Ser Fish Bull. Vol 70, No 3, p 659-670. 1972.
Identifiers: Alosa-Sapidissima, *Shad (American), *Water temperature, *Fish migration.

The peak of spawning runs of American shad (Alosa sapidissima) into rivers at various latitudes on the Atlantic and Pacific coasts of North America takes place when water temperatures are near 18.5C. At the Bonneville Dam, Columbia River, Washington, 90% of the run as a rule takes place when river temperatures are between 16.0 and 19.5C. At the fish ladder of the Holyoke Water Power Company on the Connecticut River, the temperature at the peak of the shad run averaged 19.5C for 15 yr. In the St. Johns River, Florida, peak movement occurs in Dec. and Jan. at the time of the annual minimum water temperature, or 14 to 20C. Migrations of shad in the Atlantic Ocean follow paths associated with approximately the same range of temperatures (13-18C). Annual cycles of ocean warming cause shad to move into the Gulf of Maine in the summer, to the middle Atlantic in the winter, and to the south in the early spring. Juvenile shad move downstream in the fall, coinciding with a decline in the temperature of each stream to below 15.5C. A path of migration for shad in the Pacific Ocean is hypothesized from the known seasonal changes in ocean temperature. The potential effects of artificial warming of streams on timing and survival of shad runs in northern and southern latitudes are discussed.--Copyright 1973, Biological Abstracts, Inc.

THE BENTHIC FAUNA IN FOUR SMALL SOUTHERN APPALACHIAN STREAMS,
Georgia Univ., Athens. Dept. of Entomology.
W. R. Woodall, Jr., and J. B. Wallace.
Am Midland Nat, Vol 88, No 2, p 393-407, 1972.
Identifiers: *Appalachia, *Benthic fauna, Biomass, Fauna, Pine, Streams, Vegetation, Watersheds (Basins), *Forest watersheds, Detritus.

Monthly quantitative samples of benthic organisms were collected from streams in 4 different watersheds from Aug. 1968 through July 1969. Each of the watersheds supports one of the following types of vegetation: old-field succession, hardwood forest, white pine forest with a few hardwoods, coppice forest. The kinds of organisms in the 4 streams were generally similar but their relative importance varied significantly. A Duncan's multiple-range test showed significant differences in the numbers of most taxa among the watersheds. The old-field stream had the greatest abundance while the coppice stream had the greatest standing crop biomass. The white pine stream had lowest standing crops of both numbers and biomass. Most of the differences among watersheds were attributed to different inputs of allochthonous detritus.--Copyright 1973, Biological Abstracts, Inc.

EXTREME WATER STRESS AND PHOTOSYNTHETIC ACTIVITY OF THE DESERT PLANT ARTEMISIA HERBA-ALBA ASSO,
Wuerzburg Univ. (West Germany). Botanisches Institut II.
L. Kappen, O. L. Lange, E-D. Schulze, M. Evenari, and U. Buschbom.
Oecologia (Berlin), Vol 10, No 2, p 177-182, 1972. 2 fig, 20 ref.

Descriptors: *Sagebrush, *Soil-water-plant relationships, *Moisture stress, *Hydrostatic pressure, Deserts, Osmotic pressure, Diurnal, Dry seasons, Desert plants, Plant physiology, Leaves, Plant growth, Arid climates, *Photosynthesis, Water requirements, Summer, Metabolixm.
Identifiers: *Israel (Negev Desert), Artemisia herba-alba.

Artemisia herba-alba, a good example of a desert plant growing under high water stress, in the dry season in the Negev Desert, Israel, has a very low water content and shows values of negative hydrostatic pressure in the xylem down to -163 bars and an extreme of osmotic potential in the leaves of -92 bars. During the night the diurnal water stress is not greatly decreased. This study of native plants growing in their natural habitat shows that an extremely low water potential is not a transient phenomenon but a necessity for summer-active desert plants in order to keep up their water supply and metabolic activity during the whole dry season. Thus, a high stress resistance does not imply physiological inactivity, and under these conditions Artemisia is still photosynthetically active for a few hours of the day during the whole dry period. (Gloyd-Arizona)
W73-12785

DELAYED SEED DISPERSAL AND RAPID GERMINATION AS SURVIVAL MECHANISMS OF THE DESERT PLANT BLEPHARIS PERSICA (BURM.) KUNTZE,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
Y. Gutterman.
Oecologia, (Berlin), Vol 10, No 2, p 145-149, 1972. 1 tab, 1 fig, 7 ref.

Descriptors: *Seeds, *Dispersion, *Germination, *Soil moisture, Root development, Desert plants, *Rainfall, Adaptation, Environmental effects, Deserts, Plant growth, Diurnal, Temperature, Geotropism, Laboratory tests, On-site data collections.
Identifiers: Seed dispersal, 'Water clocks', 'Rain clocks', Israel.

Previous studies describe the intricate dispersal mechanism for seeds of the desert plant, Blepharis persica, so that no seeds are dispersed before the soil is wet enough to support the seedlings. Habitat conditions as a part of the survival mechanism are discussed. Laboratory experiments with seeds of six ecotypes of this desert species showed that these seeds are capable of germinating within 50 minutes of exposure to moisture, in light or dark, at temperatures ranging from less than 10C to over 40C. Within the first 24 hours from wetting, moreover, radicles reach a length of about 49 mm. Under natural conditions in sunlight seeds of the six ecotypes sown on the surface of wet sand were examined 50 minutes from the first wetting, and these showed radicles emerging from all seeds and starting to bend geotropically. The rapid germination capability in light and dark over a wide temperature range, together with the two 'water clocks' described earlier, assures that the seeds of this plant are not dispersed and do not germinate until a water supply ample for survival of the seedlings is present. Thus, the germination mechanism of Blepharis is demonstrated to be well adapted to desert conditions and an integral part of the survival mechanism for the species. (Gloyd-Arizona)

SODIUM RELATIONS IN DESERT PLANTS: 1. CATION CONTENTS OF SOME PLANT SPECIES FROM THE MOJAVE AND GREAT BASIN DESERTS,
California Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
A. Wallace, E. M. Romney, and V. Q. Hale.
Soil Science, Vol 115, No 4, p 284-287, April 1973. 5 tab, 12 ref.

Descriptors: *Salt tolerance, *Sodium, *Cations, *Plant physiology, *Halophytes, Desert plants, Southwest U.S., Deserts, North America, Saline soils, Habitats, Calcium, Analytical techniques, Salts, Leaves, Soil horizons, Potassium, Soil chemical properties.
Identifiers: Mojave Desert, Great Basin Desert.

The deserts of western North America, and elsewhere, have many plant species that are highly adapted to salinity, and the present study was made in order to obtain a better understanding of salt tolerance in plants. Accordingly, the cation composition of some plant species, native to the northern Mojave and southern Great Basin Deserts and distributed in saline and nonsaline habitats, was examined. Leaves of 23 plant species was analyzed for mineral cations by an emission spectrographic technique. Some species tended to accumulate sodium in the leaves, particularly species that grew in areas where salts had accumulated. Distribution in the field of three Lycium species may be related to salinity. Sodium contents of the Lycium species were inversely related to those of calcium. In areas where other species accumulated sodium, Grayia spinosa was found to be an accumulator of large amounts of potassium. Several members of the Chenopodiaceae accumulated sodium in the leaves but not all of them did. Plant species and soil both seemed to determine the cation contents of plants. Larrea divaricata failed to grow where C horizons were highly saline and where A horizons contained over 10 me/100 g exchangeable potassium. Soil analyses were made for several locations by standard procedures. (See also W73-12793) (Gloyd-Arizona)
W73-12792

SODIUM RELATIONS IN DESERT PLANTS: 2. DISTRIBUTION OF CATIONS IN PLANT PARTS OF THREE DIFFERENT SPECIES OF ATRIPLEX,
California Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
A. Wallace, R. T. Mueller, and E. M. Romney.
Soil Science, Vol 115, No 5, p 390-394, May 1973. 4 tab, 21 ref.

Descriptors: *Salt tolerance, *Sodium, *Cations, *Plant physiology, Desert plants, Southwest U.S., Halophytes, Chlorine, Potassium, Leaves, Root zone, Sodium chloride, Nutrients.
Identifiers: *Saltbush.

Since various mechanisms seem to be involved in desert plants extremely tolerant of high concentrations of salts, sodium distribution in three species of Atriplex of southwestern U.S. was studied. A. hymenelytra cuttings were grown in Yolo loam soil for 35 days after addition of three levels of sodium chloride. Highest concentrations of sodium, chlorine, and potassium occurred in shoots with a steep gradient from top leaves to roots. High concentrations of sodium in leaves indicate the possible presence of salt glands. Yields of A. hymenelytra grown in solution culture responded some to sodium; root to leaf gradients for sodium and potassium were similar to the plants grown in soil. When other nutrients were not limiting, growth of A. confertifolia in the presence of a relatively sharp gradient of sodium content existed with leaves higher than stems and stems higher than roots. Yields were also increased by sodium for A. canescens, but sodium and potassium contents were much lower than for A. confertifolia, and the leaf-stem-root gradient for sodium was poorly pronounced. A. canescens seemed to be resistant to absorption of large quantities of sodium even though it tolerates high levels of it. (See also W73-12792) (Gloyd-Arizona)

WELWITSCHIA MIRABILIS: PARADOX OF THE NAMIB DESERT,
C. H. Bornman.
Endeavour, Vol 31, No 113, p 95-99, May 1972. 8 fig, 5 ref.

Descriptors: *Leaves, *Desert plants, *Moisture uptake, *Plant tissues, Gymnosperms, Africa, Fog, Plant morphology, Water utilization, Stomata, Absorption, Solutes, Translocation, *Adaptation, Arid climates, Deserts, Plant growth, Plant physiology, Root systems, Hydrostatic pressure, Evolution.
Identifiers: *Namib Desert (South West Africa), Coastal deserts, *Welwitschia.

Welwitschia mirabilis, first described in 1861, is a long-lived perennial, endemic to the Namib Desert of South West Africa. It is a monotypic species, grouped with the genera Ephedra and Gnetum in the Order Gnetales, Class Gymnospermae. Nonxeromorphic in aspect, the plant consists of a woody, unbranched, turnip-shaped stem having a depression surrounded by a rim of green, meristematic tissue from which two giant, parallel-ribbed leaves arise. The leaves, very long-lived and persistent, may reach enormous proportions and seem remarkably adapted to the prevailing desert conditions and coastal fog. It is on these huge exposed leaf surfaces that the early-morning fog condenses, is absorbed through the stomata, and conducted to various parts of the plant. The root system is relatively shallow and simple. Anatomical investigations by the author and others indicate that the ultrastructure of the food-conducting tissue of Welwitschia provides significant evidence against the theory of mass-flow of dissolved organic substances by hydrostatic pressure -- research that well may affect quite profoundly current concepts of food transport in plant tissues. This plant probably orginiated under tropical conditions, evolving and adapting in its development to the changing climatic conditions, now manifest by those of the Namib with its coastal fog. (Gloyd-Arizona)

MUSSELS IN THE UNIQUE NICKAJACK DAM CONSTRUCTION SITE, TENNESSEE RIVER, 1965,
Tennessee Valley Authority, Muscle Shoals, Ala. Div. of Environmental Research and Development.
B. G. Isom.
Malacol Rev. Vol 5, No 1, p 4-6. 1972. Illus.
Identifiers: *Construction sites (Dams), Corbicula-Manilensis, Dams, *Mussels, Nickajack Dam, Rivers, *Tennessee River, Clams.

Nickajack Dam is located at Tennessee River Mile (TRM) 424.7 in Marion County, Tennessee, just northwest of the juncture of the state lines of Alabama, Georgia and Tennessee. Mussels were collected 16 June 1965, the day the coffer dam was dewatered and the riverbed exposed for construction of the dam. Seventeen species of mussels and the Asiatic clam (Corbicula manilensis) were collected from the site. Seventy-six percent (13 of 17) of the mussel species collected were those reported by Ortmann (1925).--Copyright 1973, Biological Abstracts, Inc.

THE ANNUAL CYCLE OF SMALL MAMMAL POPULATIONS ON A ZAMBIAN FLOODPLAIN,
Akron Univ., Ohio. Dept. of Biology.
W. Sheppe.
J Mammal. Vol 53, No 3, p 445-460. 1972, Illus.
Identifiers: *Annual cycle, Crocidura-mariquensis, Crocidura-occidentalis, Floodplains, *Mammals, Mastomys-natalensis, Pelomys-fallax, *Zambian floodplain, Animal populations.

Several species of rodents and shrews live on the Kafue River Flats when they are not covered by floodwaters. Mastomys natalensis is usually the most abundant. Pelomys fallax, Crocidura mariquensis, and C. occidentalis often are common in wet sites. Breeding begins late in the dry season and is at its height during the rains. Populations are built up at this time, and as floodwaters rise over a period of several months they are forced to the margins of the floodplain, where they sometimes form dense refugee populations. As the flood slowly recedes they follow it out, and by the end of the dry season the few surviving animals are confined largely to marshy areas near the river. Body weight and fat deposits decrease during the dry season. Live-trapping studies suggest that populations are unstable throughout the year, with few animals resident in an area for more than a few weeks. Small mammals adapt to the unstable environment of the Flats by moving about more than populations in more stable environments and by breeding rapidly when conditions permit.--Copyright 1973, Biolgical Abstracts, Inc.
W73-12814

FROST RESISTANCE IN EUCALYPTUS: A NEW METHOD FOR ASSESSMENT OF FROST INJURY IN ALTITUDINAL PROVENANCES OF E. VIMINALIS,
Australian National Univ., Canberra. School of General Studies.
D. M. Paton.
Aust J Bot. Vol 20, No 2, p 127-139. 1972, Illus.
Identifiers: Altitudinal cline, Assessment, *Eucalyptus, Eucalyptus-viminalis, *Frost injury (Plants), Methods, Plant growth, *Australia.

Seedlings of E. viminalis were grown under controlled environmental conditions and exposed to single frost treatments between -1 and -5C. A new objective method for assessment of frost injury was developed on the basis that killed leaf tissue lost water until equilibrium was established with atmospheric moisture. The percentage ratio of dry weight to wet weight was found to increase from 30% for unaffected plants to 85% for killed plants, and intermediate values provided a reliable quantitative assessment of the severity of intermediate injury. There was no clear relationship between frost resistance and growth rate. Frost resistance increased with increase in altitude of seed source about 1000 ft, but the sea level provenance was as frost-resistant as the provenance at 3600 ft, which suggested that more than an altitudinal cline for frost resistance is involved. Variation in frost resistance within half-sib families and within provenances was often significant and of the same order as the variation between provenances. Thus frost resistance in E. viminalis appears to involve several different mechanisms. Within-provenance and within-family variability was characterized by a low frequency of plants with intermediate injury, and the implications of balancing selection between susceptible and resistant phenotypes as one possible mechanism for this, are discussed.--Copyright 1973, Biological Abstracts, Inc.

THE PROFUNDAL FAUNA OF LLYN TEGID, NORTH WALES,
Liverpool Univ. (England). Dept. of Zoology.
P. C. Hunt, and J. W. Jones.
J Zool Proc Zool Soc Lond. Vol 168, No 1, p 9-49, 1972, Illus.
Identifiers: Distribution patterns, Fauna, Invertebrates, *Profundal fauna, Seasonal, *Wales (Llyn Tegid).

Benthic fauna samples were quantitatively collected each month from the 6-40 m depth zone of Llyn Tegid (Great Britain) for a period of 1 yr. The seasonal distribution, abundance and life cycles of the invertebrate species are discussed in addition to a general description of the physical and chemical environment in which they live. The abundance and composition of the profundal fauna is compared with that of a similar survey carried out by D. R. Dunn in 1951/2 and shows a fourfold increase in total numbers of animals. The contributions to the increased profundal fauna of all animals recorded in 1951/2 and of those that have colonized this zone since that time are discussed.--Copyright 1973, Biological Abstracts, Inc.
W73-12823

NUTRIENT UPTAKE BY TUPELO GUM AND BALD CYPRESS FROM SATURATED OR UNSATURATED SOIL,
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
R. E. Dickson, T. C. Broyer, and C. M. Johnson.
Plant Soil. Vol 37, No 2, p 297-308, 1972.
Identifiers: Anaerobic conditions, *Bald cypress, Environment, *Nutrient, Nyssa-aquatica, Saturated soil, Taxodium-distichum, *Tupelo gum.

Seedlings of tupelo gum (Nyssa aquatica L.) and bald cypress (Taxodium distichum L. Rich.) were

grown in pots containing a sphagnum moss-peat soil mix. Plants approximately 20-25 cm tall were subjected to 3 moisture treatments, saturated-aerated, saturated, and unsaturated soil; and 3 N fertilization treatments, control (no N added), urea (a reduced N source) and nitrate (an oxidized N source). Data include dry weights (g/culture) of leaves, stems, and roots; concentrations (percentage of dry weight) and contents (mg/culture) of N, P, K, Ca and Mg in leaves, stems and roots. Total dry weight was greater for plants grown in saturated-aerated soil than in either saturated or unsaturated soil. Differences in nutrient abosrption and distribution between the plants and among the water treatments were principally the result of growth differences produced by the water treatments. Element contents and often the concentrations of P, K, Ca or Mg were highest in both species when grown on saturated-aerated soil and lowest when grown on unsaturated soil. The low levels of N in plants grown on saturated soils were probably the result of dentrification, as shown by the greater content of N in plants grown on soil fertilized with urea as opposed to nitrate. Thus, urea would appear to be a better N source than nitrate for fertilization in swamp forests. Growth of, and nutrient uptake by cypress was restricted less than that of Tupelo when the plants were grown on saturated as compared to saturated-aerated soil. Thus, cypress appeared more tolerant than tupelo to the anaerobic root environment found in saturated soil.--Copyright 1973, Biological Abstracts, Inc.

WATER POTENTIAL IN RED PINE: SOIL MOISTURE, EVAPOTRANSPIRATION, CROWN POSITION,
Minnesota Univ., St. Paul. Coll. of Forestry.
E. Sucoff.
Ecology. Vol 53, No 4, p 681-686. 1972. Illus.
Identifiers: Diurnal, *Evapotranspiration, Growth, Patterns, *Pines (Red), Pinus-Resinosa, Soils, Transpiration, *Soil moisture.

Diurnal patterns in leaf water potential (LWP) were examined on 8 red pine (Pinus resinosa Ait) trees throughout 1 summer in northern Minnesota. The daily high in LWP was plotted against total soil moisture to produce a soil-moisture release curve characterizing the plant-soil-atmosphere system. Diurnal patterns in LWP at various soil moistures were compared. Also compared were patterns in LWP under high and low evaporational demand and constant soil moisture. Results were generally consistent with previously constructed models. Very little variation in LWP was observed among whorls or needle ages. Laboratory studies of the effects of LWP when synthesized with data from the forest on occurrence of LWP suggest that growth was limited by water deficit every day of the 1969 summer.--Copyright 1973, Biological Abstracts, Inc.
W73-12837

WATER RELATIONS OF PLANTS IN RAISED SPHAGNUM PEAT BOGS,
Department of Agriculture, Ottawa (Ontario). Plant Research Inst.
E. Small.
Ecology. Vol 53, No 4, p 726-728. 1972. Illus.
Identifiers: Bogs, Drought, *Peat bogs, Physiological studies, Sphagnum, Woody plants.

The water relations of woody plants of a raised sphagnum peat bog were examined by evaluation of water potential employing the pressure bomb and by measuring transpiration resistance with a leaf-resistance porometer. The plants studied proved to be similar to those of a number of mesophytes growing adjacent to the bog and exhibited no evidence of drought stress. The concept of physiological drought is an inadequate explanation of the extremely xeromorphic characteristics of bog vegetation, which are more plausibly accounted for by other factors.--Copyright 1973, Biological Abstracts, Inc.

THE INFLUENCE OF ORGANIC DRIFT ON THE FOOD HABITS AND LIFE HISTORY OF THE YELLOWFIN SHINER, NOTROPIS LUTIPINNIS (JORDAN AND BRAYTON),
Oklahoma Univ., Norman. Dept. of Zoology.
W. K. Reisen.
Am Midland Nat. Vol 88, No 2, p 376-383. 1972.
Identifiers: *Drift (Organic), Food habits, Invertebrates, Life history, Notropis-Luptipinnis, Organic, *Shiners (Yellowfin), *South Carolina (Praters Creek).

Recent investigations of invertebrate drift have suggested a food chain relationship between riffle-dwelling benthos and lotic fishes, with drift acting as a transport mechanism facilitating predation. A year-long study of N. lutipinnis (Jordan and Brayton), in Praters Creek, Pickens Co., South Carolina, has shown that significant synchronization exists among drift, fish-feeding activity and spawning. A qualitative and quantitative evaluation of adult stomach contents suggested that the drifting invertebrates were consumed in quantities proportional to their composition by weight in the drift. Cyprinidae fry drifted during May when the total invertebrate drift was highest. Drifting fry exhibited a marked nocturnal periodicity with the greatest numbers recovered between 0330 and 0530 AM.--Copyright 1973, Biological Abstracts, Inc.

EXTENSION OF RANGE OF THE TRICLAD TURBELLARIAN PHAGOCATA GRACILIS (HALDEMAN),
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. C. Smrchek.
Trans Am Microsc Soc. Vol 91, No 4, p 596-599. 1972. Illus.
Identifiers: Dugesia-dorotocephala, Dugesia-tigrina, *Michigan, Phagocata-gracilis, Phagocata-morgani, Phagocata-velata, Procotyla-fluviatilis, *Triclad turbellarian.

The triclad P. gracilis (Haldeman, 1840) is reported for the first time from Michigan. Numerous individuals were first collected in 1968 in Oden Stream (T35N R4W S18), Emmet County, a cold, spring-fed fish hatchery outlet stream. Ecological data collected over a 2 mo. period and observations on planarian populations are presented. Other species found in the stream include Dugesia dorotocephala, D. tigrina, Phagocata morgani, P. velata, and Procotyla fluviatilis; Dugesia dorotocephala may be unable to compete with Phagocata gracilis.--Copyright 1973, Biological Abstracts, Inc.

MICRODISTRIBUTION AND DENSITY AS FACTORS AFFECTING THE DOWNSTREAM DRIFT OF MAYFLIES,
Saskatchewan Univ., Saskatoon. Dept. of Biology.
D. M. Lehmkuhl, and N. H. Anderson.
Ecology. Vol 53, No 4, p 661-667. 1972. Illus.
Identifiers: Behavior, Density, Distribution patterns, *Drift, *Mayflies.

During high volume of flow in a stream that has considerable seasonal fluctuation, the microdistribution of 5 species of mayflies was determined by displacement of individuals by drift from rapid current areas to those with gentle or no current. The major effect of drift was dispersal, not depletion, of the mayfly population. Occurrence in drift is determined by a species-specific complex of interdependent factors including life cycle, microdistribution (both before and after the effect of spates), and the behavioral characteristic of individual species.--Copyright 1973, Biological Abstracts, Inc.

DESCRIPTION AND ECOLOGY OF HYAIELLA TEXANA N. SP. (CRUSTACEA: AMPHIPODA) FROM THE EDWARDS PLATEAU OF TEXAS,
Oklahoma Univ., Norman. Dept. of Zoology.
M. M. Stevenson, and A. E. Peden.
The American Midland Naturalist, Vol 89, No 2, p 426-436, April 1973. 7 fig, 6 ref.

Descriptors: *Amphipoda, *Crustaceans, *Ecology, *Systematics, *Speciation, *Texas, Aquatic habitats, Invertebrates, Aquatic animals, Classification, Animal populations, Water temperature.
Identifiers: *Hyalella texana, Hyallela azteca, *Clear Creek (Tex), Arthropods, Animal morphology, Population density, Macroinvertebrates, Scuds.

Hyalella texana, a new species of amphipod crustacean, is described from Clear Creek Spring, Menard County, Texas, 16.7 km W of Menard. It is distinguished from H. azteca, which also occurs at this locality, by the presence of four large tergite spines, enlarged mouth parts, more antennal segments and narrower body and appendage segments. Each species is found predominantly in different habitats of the spring area. (Holoman-Battelle)

SOME MARINE DIATOMS FROM THE GALAPAGOS ISLANDS,
N. I. Hendey.
Nova Hedwigia, Vol 22, Nos. 1-2, p 371-422, 1971. 32 fig, 68 fig.

Descriptors: *Diatoms, *Marine algae, *Speciation, *Classification, Chrysophyta, Varieties, Systematics, Plant groupings, South America, Marine plants.
Identifiers: *Galapagos Islands.

One hundred and seventy-six specific taxa of marine diatoms have been identified and four previously unknown taxa have been described from material collected by Dr. Ira L. Wiggins from Isla Fernandina, Galapgos Islands, on January 27, 1967. The material was taken from foam washed up by surf at Punta Espinosa. The classification used is according to Hendey (1958, 1964). Descriptions are given only of the lesser known taxa. (Holoman-Battelle)

EFFECTS OF AERATION, WATER SUPPLY, AND NITROGEN SOURCE ON GROWTH AND DEVELOPMENT OF TUPELO GUM AND BALD CYPRESS,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
R. E. Dickson, and T. C. Broyer.
Ecology. Vol 53, No 4, p 626-634, 1972, Illus.
Identifiers: *Aeration, *Cypress (Bald), Fertilizers, Growth, *Gum (Tupelo), Moisture, *Nitrogen, Nyssa-Aquatica, Soils, Taxodium-Distichum, Water supply.

Seedlings of tupelo gum (Nyssa aquatica L.) and bald cypress (Taxodium distichum L. Rich.) were cultured in saturated-aerated, saturated and unsaturated soil. Experiments were designed to measure and evaluate the relative reaction of tupelo and cypress to various soil-moisture conditions, determine the effects of aeration and water availability on plant moisture stress and growth, and compare effects of 2 forms of N fertilizer (urea and nitrate) on growth. On the basis of height and dry weight, both tupelo and cypress grew best in saturated-aerated soil. Growth was better in saturated soil then in unsaturated soil, but only when water in the unsaturated soil decreases substantially below field capacity before rewatering. Plant moisture stress was determined by a pressure-bomb technique. For tupelo, average daily maximum tensions were 7.2 and 7.0 atm (atm±1.013 bar) with saturated and unsaturated soil, respectively; for cypress, comparative tensions were 10.9 and 8.5 atm. When soil moisture decreased from field capacity to the wilting point, the daily maximum tension in plants increased from 7.0 to 12.8 and from 8.5 to 17.6 atm in tupelo and cypress, respectively. Growth of plants was related to the cumulative effect of their internal moisture stress. When tupelo plants were subjected to 595 atm days (daily maximum tension X number of days with that tension), height growth was 37% and dry weight 40% less than plants subjected to 490 atm-days. Fertilization with urea produced more growth than fertilization with nitrate.--Copyright 1973, Biological Abstracts, Inc.

THE DISTRIBUTION OF STREAM-DWELLING TRICLADS (PLATYHELMINTHES) IN NORTH WALES,
Reading Univ. (England). Dept. of Zoology.
J. F. Wright.
Freshwater Biol. Vol 2, No 1, p 57-64. 1972. Illus.
Identifiers: *Distribution patterns (Fauna), Streams, *Triclads (Plathyhelminthes), *Wales.

Information collected during a survey of stream-dwelling triclads in 2 contrasted areas of North Wales is presented. The first study area was located in Caernarvonshire, Wales on the mainland of North Wales and included a mountainous region rising to over 1000 m with abundant cold springs. In contrast, the study area on the nearby island of Anglesey was characterized by relatively warm, slow-flowing streams passing through gently undulating land which did not rise above 153 m. The object of the survey was to collect background data so that suitable streams could be chosen for more intensive studies on factors determining the distribution and abundance of stream-dwelling triclads. Distribution maps for the commonly occurring species were prepared and observations on the relationship between source-type and triclad fauna were obtained. The possible role of interspecific competition was of particular interest.--Copyright 1973, Biological Abstracts, Inc.

GROWTH AND CHEMICAL COMPOSITION OF EIGHT GRASSES GROWN UNDER HIGH WATER TABLE CONDITIONS,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
D. V. Waddington, and T. L. Zimmerman.
Commun Soil Sci Plant Anal. Vol 3, No 4, p 329-337. 1972.
Identifiers: Agrostis-Palustris, Agrostis-Tenuis, *Chemical composition (Grasses), Clipping, Eleusine-Indica, Festuca-Arundinacea, Festuca-Rubra, *Grasses, Growth, Lolium-Perenne, Poa-Annua, Poa-Pratensis, Rooting, *Water table, Yields.

Eight grasses (Eleusine indica, Poa annua, P. pratensis, Agrostis tenuis, A. palustris, Festuca arundinacea, F. rubra, Lolium perenne) were grown under high water table conditions for 14 wk in a greenhouse experiment. Water tables were maintained at 2 and 5 inches below the soil surface. Differences in water table depth influenced clipping yields only slightly. Although total root weights were not reduced with the 2-inch water table, there was a trend for fewer roots at lower depths and more roots near the surface with this treatment. The shallowest root systems occurred with annual bluegrass, Kentucky bluegrass and creeping red fescue. Elemental composition of the clippings was influenced by species and time of sampling. The greatest effect of water table depth on elemental content of the clippings occurred with Mn.--Copyright 1973, Biological Abstracts, Inc.

Three trematodes (Monogenea:Dactylogyridae), Anonchohaptor muelleri, Icelanochohaptor microcotyle and Pellucidhaptor micracanthus, are described from Carpiodes carpio (Raf.) from the Missouri River in North Dakota and South Dakota. The generic diagnoses of Anonchohaptor Mueller, 1938, and Pellucidhaptor Price and Mizelle, 1964, are emended. The finding of Gyrodactylus dakotensis Leiby et al., 1972, Neodiscocotyle carpioditis Dechtiar, 1967, P. eremitis Rogers, 1957 (monogenetic trematodes), and Camallanus ancylodirus Ward and Magath, 1916 (nematode), from C. carpio constitute new host records. Also, 7 new locality records are established, 6 of which are reported for the first time from the upper Missouri River.--Copyright 1973, Biological Abstracts, Inc.

CONTRIBUTIONS TO THE LIFE HISTORY OF THE PIUTE SCULPIN IN SAGEHEN CREEK, CALIFORNIA,
National Marine Fisheries Service, Miami, Fla. Southeast Fisheries Center.
A. C. Jones.
Calif Fish Game. Vol 58, No 4, p 285-290. 1972.
Identifiers: *California, Cottus-Beldingi, History, Insects, Larvae, *Piute sculpin, Sagehen Creek (Calif), Salmo-Gairneri, Salmo-Trutta, Salvelinus-Fontinalis, Sculpin.

The Piute sculpin, Cottus beldingi Eigenmann and Eigenmann, is the dominant fish by number of weight in Sagehen Creek, a mountain stream on the east slope of the Sierra Nevada. Sculpins are at their greatest density in the middle of the creek where they, along with brook trout (Salvelinus fontinalis) and rainbow trout (Salmo gairdneri), find good foraging for bottom dwelling aquatic insect larvae. The numbers of sculpins are low in the precipitous headwaters of Sagehen Creek and also low in the lower reaches of the stream, which are frequented by their chief predator, the brown trout (Salmo trutta), and by other fishes. Sculpins in Sagehen Creek and Lake Tahoe exhibit minor differences in growth and reproduction but appear to occupy a similar ecological niche in the 2 areas.--Copyright 1973, Biological Abstracts, Inc.

PARASITISM OF MOSQUITOES BY WATER MITES,
Ohio Dept. of Health, Columbus. Div. of Communicable Diseases.
M. Jalil, and R. Mitchell.
J Med Entomol. Vol 9, No 4, p 305-311. 1972. Illus.
Identifiers: Abundance, Morphology, *Mosquitoes, Parasitisms, Pionid, Population, Thyasid, *Ohio, *Water mites.

A large sample of Ohio mosquitoes was parasitized by 2 kinds of water mites. Thyasid-type mites walk on the water surface and encounter hosts there while the pionid-type larvae are strictly aquatic. The 2 types of larvae differ greatly in general morphology. Both kinds of larvae are locally abundant in Ohio but the species and their degree of host specificity remain to be worked out. A few local populations of mosquitoes are so heavily infested that the mites could serve as useful markers in studies of these populations. The discouraging results attempts to use water mites as markers are due to failure to separate records and identify kinds of mite larvae. When records are not pooled and the biology of the mite given due consideration, it is possible to use the parasitic larvae in distribution and age-grading studies of their host mosquitoes.--Copyright 1973, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

THE SEDIMENTS AND HISTORY OF LAKE BUTTE DES MORTS, WISCONSIN,
Wisconsin State Univ., Oshkosh. Limnology Lab.
J. W. McKee, and J. S. Laudon.
Available from the National Technical Information Service as PB-222 273, $3.50 paper copy, $1.45 in microfiche. Report of Investigations Number 3, March 1972. 55 p, 15 fig, 4 ref. OWRR A-019-WIS (1). OWRR A-030-WIS (1). 14-01-0001-1870, 14-31-0001-3050.

Descriptors: *Sediments, *Erosion, Vegetation effects, Interfaces, *Glacial drift, Lakes, *Marsh plants, *Lake sediments, Geologic history, *Wisconsin.
Identifiers: *Lake Butte des Morts (Wis).

Study of the sediments of Lake Butte des Morts, Wisconsin, and their stratigraphic relationships, has produced a history of lake evolution from the early years of the last deglaciation. Samples of bottom sediment (at the sedimentary interface) were taken from locations selected to represent each environment of deposition in the lake. In the laboratory cores were extruded from the plastic corer liners for analysis and the sediments were divided into eleven types. These sediment types are not intended to represent stratigraphic units though some may exist as a unit and may be conceptually categorized as a rock-stratigraphic unit--e.g.--the red varved clay. The paleolimnological approach provides background information of value in the management of lakes and also adds some detail to the knowledge of local natural history. (Kerrigan-Wisconsin)

CATASTROPHIC ROCK SLIDE, MOUNT HUASCARAN, NORTH-CENTRAL PERU, MAY 31, 1970,
J. M. Browning.
American Association of Petroleum Geologists Bulletin, Vol 57, No 7, p 1335-1341, July 1973. 8 fig, 5 ref.

Descriptors: *Rockslides, *Landslides, *Debris avalances, *Disasters, Avalanches, South America, Mass wasting, Sediment transport, Sedimentation.
Identifiers: *Peru, *Mt Huascaran.

A catastrophic rockslide involving over 2 million cu m of rock moved down the valley of the Llanganuco River, and split into two lobes, one of which killed approximately 2,000 people in the town of Rangrahirca and the other killed approximately 19,00 people in the town of Yungay. The slide was triggered by an earthquake 85 km away, at a depth of 54 km. In the upper and steepest drop the slide fell and swept as a nearly friction-free unit mass a distance of 14.5 km, a vertical drop of 13,700 ft, in 3 minutes. Over the next 50 km the slide moved as a fluid mass, covering the distance in 2 hours. Deposition from the slide was velocity-dependent. (Knapp-USGS)

BUREAU OF RECLAMATION PROCEDURES FOR PREDICTING SEDIMENT YIELD,
Bureau of Reclamation, Denver, Colo.
R. I. Strand.
Paper, Sediment Yield Workshop, USDA Sediment Lab, Oxford, MS, Nov 1972. 15 p, 3 fig, 4 tab, 5 ref.

Descriptors: *Sediment transport, Sediment load, Bed load, *Sedimentation, Analytical techniques, Sedimentation rates, Sediment discharge, Storage capacity, Drainage systems, Runoff, Watersheds (Basins), On-site data collections, Forecasting.
Identifiers: San Juan River, Lake Havasu, Sediment rating curves, Runoff plot, Flow duration curves, Calculations.

The techniques used by the Bureau of Reclamation for predicting sediment yields vary depending on data available and complexity of the problem. For situations involving large reservoirs with large drainage areas and significant sediment inflows, the flow-duration, sediment rating curve procedure is used with corrections for unmeasured load. An example using this procedure is given for the San Juan River and indicates 58% of the annual sediment yield occurs during the thunderstorm period, although the runoff during that period is only 36% of the average annual value. In another situation where Alamo Dam was closed upstream of Lake Havasu, sediment yield rate curves were used to calculate the new sediment yield. These curves are developed by plotting the sediment yield per unit area per year against the drainage area for watersheds with similar climatic, topographic, and geologic conditions. For smaller drainage systems intersected by conveyance systems, predicting sediment yield is more difficult and further study is needed. (USBR)

RIVER CHANNEL CHANGE WITH TIME: AN EXAMPLE,
Geological Survey, Berkeley, Calif.
L. B. Leopold.
Geological Society of American Bulletin, Vol 84, No 6, p 1845-1860, June 1973. 17 fig, 3 tab, 4 ref.

Descriptors: *Alluvial channels, *Urbanization, *Geomorphology, *Meanders, Erosion, Sedimentation, Runoff, Discharge (Water), Urban hydrology, Channel morphology, Flood plains.
Identifiers: Rockville (Md).

Channel cross sections were surveyed over a period of 20 years (1953 to 1972) to determine the amount and kind of change of channel area and position of a 3.7-sq-mi basin, Watts Branch, near Rockville, Maryland. For the first 12 years, the channel progressively but slowly became smaller as urbanization of the basin gradually proceeded. After 1966, a threshold of change apparently was passed and, probably as a result of an increased rate of land alteration upstream, large amounts of sediment were deposited within the channel and overbank. The number of floods exceeding channel capacity increased from two to more than 10 per year. Simultaneously, the channel area began to increase. Despite the trend toward increasing cross-sectional area, the net result after 20 years was a channel smaller by 20% than it had been originally. Urbanization did not alter the rate of channel migration. (Knapp-USGS)
W73-12590

SEA FLOOR OFF MAGDALENA DELTA AND SANTA MARTA AREA, COLOMBIA,
Scripps Institution of Oceanography, La Jolla, Calif.
F. P. Shepard.
Geological Society of America Bulletin, Vol 84, No 6, p 1955-1972, June 1973. 12 fig, 11 ref. ONR Contract N00014-69-A-0200-6006; NSF Grant GA-4593.

Descriptors: *Bottom sediments, *Submarine canyons, *Deltas, Topography, Sedimentation, Continental shelf, Sounding, Stratigraphy, Sedimentary structures, South America, Structural geology.
Identifiers: Andes, Colombia.

The undersea slope bordering the Magdalena delta and the adjacent Andes has a complex morphology. This includes typical delta-front valleys directly off the Magdalena River and off its old mouths. The area is bordered to the west by anticlinal hills and synclinal valleys, and to the north by fault blocks with a northeasterly trend. To the east, the slope has mud diapirs rising mostly from between 730 and 1,370 m. Off the mountainous coast east of Santa Marta, a large submarine canyon winds down the slope almost to Colombia Basin. The sea-floor relief was formed by a combination of complex faulting and folding, sedimentation from the Magdalena (with attendant formation of slump valleys), partial filling of structural valleys, diapiric intrusion of plastic mud from underlying formations, and marine erosion of a large submarine canyon. (Knapp-USGS)
W73-12591

COMPUTER MODELS OF DELTA GROWTH DUE TO SEDIMENT INPUT FROM RIVERS AND LONGSHORE TRANSPORT,
Oregon State Univ., Corvallis. School of Oceanography.
P. D. Komar.
Geological Society of America Bulletin, Vol 84, No 7, p 2217-2226, July 1973. 9 fig, 2 tab, 16 ref. NOAA Sea Grant 2-35187.

Descriptors: *Deltas, *Sediment transport, *Waves (Water), *Simulation analysis, Mathematical models, Sedimentation, Littoral drift.

Computer-simulation models were developed to investigate the growth and equilibrium shape of a river delta in which wave action is the dominant force in redistributing sands. The models appear to yield reasonable comparisons with real beaches and delta shapes. The models indicate that the deltas quickly reach an equilibrium configuration in which the wave energy flux is just capable of transporting and redistributing along the shore all the sand supplied by the river. The wave breaker angle decreases systematically along the delta away from the river mouth due to a progressive decrease in the quantity of river sand remaining to be transported. When the wave energy flux is low or the river sediment supply too high for the existing waves nearly all the sand remains near the river mouth, producing one distributary which, if duplicated, would form a bird-foot delta. Oblique wave approaches produced asymmetric deltas, but the asymmetry was not as pronounced as anticipated. (Knapp-USGS)
W73-12592

BLACK PHYTOKARST FROM HELL, CAYMAN ISLANDS, BRITISH WEST INDIES,
Texas Univ., Austin. Dept. of Geology.
R. L. Folk, H. H. Roberts, and C. H. Moore.
Geological Society of America Bulletin, Vol 84, No 7, p 2351-2360, July 1973. 12 fig, 39 ref.

Descriptors: *Karst, *Algae, *Vegetation effects, *Weathering, Carbonate rocks, Geomorphology, Topography, Limestones, Dolomite.
Identifiers: *Cayman Islands, *Phytokarst.

Phytokarst is a distinctive landform resulting from a curious type of biologic erosion. Filamentous algae bore their way into limestone to produce black-coated, jagged pinnacles marked by delicate, lacy dissection that lacks any gravitational orientation. Ordinary rainfall-produced karst and littoral karst are characterized by flat-bottomed pans and vertically oriented flutes, thus differing from phytokarst. Algae attack by dissolving calcite preferentially to dolomite. (Knapp-USGS)
W73-12593

WIND-DRIVEN MODEL FOR EVAPORITE DEPOSITION IN A LAYERED SEA,
Northwestern Univ., Evanston, Ill. Dept. of Geological Sciences.
W. D. Stuart.
Geological Society of America Bulletin, Vol 84, No 8, p 2691-2704, August 1973. 11 fig, 1 tab, 28 ref.

Descriptors: *Chemical precipitation, *Evaporation, *Salts, *Brines, *Mathematical models, Sea water, Numerical analysis, Finite element analysis, Water chemistry, Water circulation.
Identifiers: *Evaporites.

Deposition of evaporites in a salinity- and density-layered sea is examined by theoretically predicting the large-scale circulation in a simplified model sea. In the constant-depth model, vertical stratification is represented by two homogeneous layers; the upper layer is normal or slightly concentrated seawater, and the considerably denser lower layer is saturated with respect to halite. Each layer has a constant density and volume. The horizontal transport form of the time-dependent equations of motion and continuity for each layer are solved numerically by a finite-difference method. Interface stresses acting between the two layers and bottom stresses acting between the lower layer and the bottom allow consideration of vertical turbulent friction. Forcing is by a constant and uniform wind stress acting on the free surface. Rotation and hydrostatic pressure gradient terms are also included in the equations of motion. (Knapp-USGS)

ERODIBILITY OF HILL SOILS OF SUTLEJ CATCHMENT AREA IN HIMACHAL PRADESH,
Indian Agricultural Research Inst., New Delhi. Div. of Soil Science and Agricultural Chemistry.
R. R. Sharma, and N. R. D. Biswas.
Indian J Agric Sci. Vol 42, No 2, p 161-169. 1972.
Identifiers: Catchments, Cation, Clay, Dispersion, *India, Sand, *Soils, Sutlej catchment, *Erosion ratios.

The mechanical composition and other physical and physicochemical properties of 4 soil profiles in the sub-watershed of Sirkhad, were determined. Erosion ratios of these soils were correlated with dispersion ratio, clay:moisture-equivalent ratio, fine sand:silt + clay ratio, sand:silt + clay ratio, fine sand:clay ratio, and with the cation exchange capacity of the soils. The high 'r' value indicates that the ratio of fine sand:silt clay may also be considered a suitable index to help the prediction of erodibility of these soils. Soils derived from shales show high erosion ratios on the surface, and consequently suffer from sheet erosion, in contrast to the gully erosion suffered by the soils derived from sandstones, which show higher ratios through the profile depth.--Copyright 1973, Biological Abstracts, Inc.

TERRACETTES: A SUGGESTED CLASSIFICATION,
Manchester Univ. (England).
E. W. Anderson.
Area (Institute of British Geographers), Vol 4, No 1, p 17-20, 1972. 7 ref.

Descriptors: *Geomorphology, *Slopes, *Grazing, *Erosion, Soil erosion, Terraces (Geologic), Topography.
Identifiers: *Terracettes, England, Scotland.

Terracettes, which are small breaks in slopes, are produced by grazing animals. Field measurements taken of terracette morphology allow a broad classification to be made. Two basic types can be distinguished: (1) normal terracettes with wide risers at a similar angle to that of the slope, and long, unbroken treads parallel to each other and normal to the slope; (2) tear terracettes with narrow, steep risers generally lacking in vegetation, and short treads which are rarely parallel or normal to the slope. Normal terracettes occur in areas of permanent pasture on predominantly mineral soils, while tear terracettes are usually found in areas of rough grazing where there is a marked organic horizon. (Knapp-USGS)
W73-12731

TRIALS ON TRENDS THROUGH CLUSTERS OF CIRQUES,
Monash Univ., Clayton (Australia).
G. Robinson.
Area (Institute of British Geographers), Vol 4, No 2, p 104-113, 1972. 2 fig, 5 tab, 22 ref.

Descriptors: *Cirques, *Snow, *Statistical methods, *Paleoclimatology, *Pleistocene epoch, Geomorphology, Correlation analysis, Variability, Glaciation.
Identifiers: *Snowlines.

When a Pleistocene snowline is plotted from a sampled population of cirque altitudes, the sampling unit by its very nature cannot be observed uniformly over space. The factors that favor a site's occupance and excavation by ice tend to produce clusters of cirques in particular parts of mountain ranges. Further, the locations of the mountain ranges are themselves frequently clustered. Thus, the total identified and measurable population of cirques studied in Tasmania is predominantly located in clusters of clusters. To examine the effects of reducing spatial clustering, a comparison is made between quadratic trend surfaces fitted to four samples of Tasmanian cirques with varying degrees of clustering, using direct correlation, analysis of variance, correlation of the trend parameters, and comparison of the reductions of sum of squares. No major differences among surfaces are revealed, and it is concluded that with a large number of highly clustered observations the empirical choice of control point distrubution depends more reasonably upon operational exigencies than upon the fear of distortion associated with clustering. STANDARDS FOR SOIL EROSION AND SEDIMENT CONTROL IN NEW JERSEY.

New Jersey State Soil Conservation Committee Publication, 1972. 116 p.

Descriptors: *Erosion control, *Sediment control, *Soil erosion, *Land development, *New Jersey, Urbanization, Sediment transport, Sedimentation, Water pollution, Bank protection, Check structures, Land management, Vegetation establishment, Slope stability.
Identifiers: *Erosion control guidelines.

The last several decades of rapid suburban development in the state of New Jersey have resulted in the erosion of soil by both wind and water. Standards and recommendations are presented to provide local governments, developers, and technical personnel with erosion control techniques. Effective erosion control begins in the project planning stage. Proper planning requires consideration of water control and soils to be encountered in order to reduce erosion problems during and after construction. Steep slopes, potential landslide areas, stream crossings, stream encroachments, and cut and fill sections should be evaluated for construction problems involved in reducing erosion and the resulting sediment damage to streams and water supplies. The evaluation of soils, existing vegetation, and geologic and hydrologic data is necessary to define problem areas. Every consideration should be given to assure the successful establishment of vegetation on disturbed areas as quickly as possible in order to minimize erosion and sediment damage. (Woodard-USGS)

CHANNEL EROSION SURVEYS ALONG PROPOSED TAPS ROUTE, ALASKA, JULY 1971,
Geological Survey, Anchorage, Alaska.
J. M. Childers.
Basic-data report, October 1972. 79 p, 62 fig, 1 tab, 8 ref.

Descriptors: *Channel erosion, *Pipelines, *Oil industry, *Alaska, Environmental effects, Conveyance structures, Oil, Surveys, Aerial photography, Planning, Sediment transport, Sediment control, Erosion control, Storms, Stream erosion, Streambeds, Evaluation, Data collections, Engineering.
Identifiers: *Trans-Alaska Pipeline System, Preconstruction data.

The U.S. Geological Survey has the threefold responsibility along the proposed route of the Trans-Alaska Pipeline System (TAPS) to investigate possible hydrologic hazards to the pipeline, to investigate possible impacts of the pipeline on water resources, and to develop a better understanding of Arctic hydrology. Because the proposed pipeline route lies within many stream channels, one of the obvious hydrologic hazards is channel erosion. Descriptions of preconstruction conditions are provided at selected channel sites along the northern segment of the TAPS from Prudhoe Bay to the Salcha River. The information could be used in studies of severe channel erosion, streambed scour, bank erosion, or rechannelization. Included is a plan for detecting and measuring significant erosion and the important factors causing the erosion, such as flood discharge, icing, and construction activities. Vertical aerial photography at most sites was obtained during low-flow, open-water conditions to provide a basis for evaluating changes that may be caused by construction and erosion. (Woodard-USGS)

OBSERVATIONS OF TUFA DEPOSITION,
Hull Univ. (England).
A. F. Pitty.
Area (Institute of British Geographers), Vol 3, No 3, p 185-189, 1971. 1 fig, 1 tab, 18 ref.

Descriptors: *Calcium carbonate, *Chemical precipitation, *Mosses, Limestones, Carbon dioxide, Water chemistry.
Identifiers: *Tufa.

Tufa formation seems always to be associated with the presence of either mosses or algae. The seasonal change in response of plant activity to varying intensities of radiant energy supply may be detected in the process of tufa deposition. In many situations, therefore, palaeoclimatic reconstructions of the environment in which fossil tufas accumulated should consider the effect of varying climatic conditions on the activity of tufa-depositing organisms as well as inferring how such changes might affect purely physicochemical processes that could theoretically be involved in tufa deposition. For instance, features of the maritime climate in Britain, especially the high precipitation and mild temperatures without extremes, contribute to the luxuriant growth of mosses. In particular, seasonal contrasts in calcium carbonate deposition are emphasized, and it is suggested that their study is one of the best ways of approaching the problem of specifying the conditions favoring or retarding tufa deposition over contrasted but much longer spans of Quaternary time. (Knapp-USGS)

EXPERIMENTAL INVESTIGATION OF ROCK WEATHERING BY SALTS,
Oxford Univ. (England).
A. Goudie, R. Cooke, and I. Evans.
Area (Institute of British Geographers), No 4, p 42-48, 1970. 3 fig, 1 tab, 7 ref.

Descriptors: *Weathering, *Salts, *Water chemistry, Hydration, Crystallization, Rock properties.

Disintegration of rocks by salts, which takes place in such diverse environments as deserts, coasts, polar areas, lakeshore, and cities, is accomplished by three principal processes: growth of crystals from solution, expansion on hydration, and thermal expansion. A series of experiments was designed to explore certain aspects of these problems. Rock samples of approximately similar initial weight, shape, and size were immersed in saturated salt solution at 17-20 deg C for one hour. They were then removed and dried in an oven, using a temperature of 60 deg C for six hours, and a temperature of 30 deg C for the remainder of each 24-hour cycle. The procedure was repeated 40 times. Na2S04 was consistently the most effective salt in causing splitting. Only sedimentary rocks were affected by splitting. Weight losses through splitting of granular disintegration by salt crystallization reflect the influence of a large number of variables. Environmental variables include the salts involved and their concentrations, the thermal regime, degree of supersaturation reached, and duration of exposure to supersaturated solutions. The effect of different salts is a function of such properties as volume increase on crystallization, rate of change of solubility with temperature, and thermal coefficients of volumetric expansion. Relevant rock properties include percentage absorption of solution, rate of solution penetration and other properties related to these, tensile strength, the nature and distribution of structural weakness, and geometric attributes of the specimens. KARST OF THE ARABIKA MASSIF (KARST MASSIVA ARABIKA),
T. Z. Kiknadze.
Izdatel'stvo 'Metsniyereba', Tbilisi, 1972. 248 p.

Descriptors: *Karst, *Karst hydrology, *Mountains, Geology, Geologic history, Geologic time, Geomorphology, Topography, Petrology, Stratigraphy, Hydrogeology, Groundwater, Water chemistry, Corrosion, Caves, Limestones, Subsurface drainage, Snow, Ice, Maps.
Identifiers: *USSR (*Abkhazia), *Arabika massif, Karst landforms, Tectonics.

Investigations were carried out in northwestern Abkhazia in 1960-68 to study geological and hydrogeological conditions of karst development on the Arabika massif, one of the most comples karst regions in the world. Data on chemical erosion in the region are tabulated and mapped, and karst landforms and factors controlling development of karst (tectonics, chemical composition of rocks, lithology, and soil-vegetal cover) are described. (Josefson-USGS)

Institut Geografii Sibiri i Dal'nego Vostoka Doklady, No 30, p 37-44, 1971. 2 fig, 4 tab, 14 ref.

Descriptors: *Water chemistry, *Water quality, *Water analysis, *Inorganic compounds, *Grasslands, Rivers, Lakes, Groundwater, Ions, Hardness (Water), Salinity, Temperature.
Identifiers: *East Siberia, *Chita Oblast, *Onon-Argun' steppe, Mineralization.

Delineation of the Onon-Argun' steppe into hydrochemical zones was based on detailed investigations of chemical composition of natural waters in southeastern Chita Oblast in 1968-70. Seven zones were identified: (1) Onon region of calcium bicarbonate waters: (2) Torey region of sodium bicarbonate waters; (3) Borzya region of bicarbonate sulfate waters; (4) Kharanor region of sodium chloride waters; (5) Nerchnisk region of calcium bicarbonate waters; (6) Klichka region of magnesium bicarbonate waters; and (7) Argun' region of calcium bicarbonate waters. Quality-of-water data are presented for the different regions. (Josefson-USGS)

SILICA IN THERMAL AND COLD WATERS (KREMNEZEM V TERMAL'NYKH I KHOLODNYKH VODAKH),
G. V. Bogomolov, G. N. Plotnikova, and Ye. A. Titova.
Izdatel'stvo 'Nauka', Moscow, 1967. 112 p.

Descriptors: *Geochemistry, *Silica, *Water types, *Groundwater, *Thermal water, Mineral water, Springs, Hot springs, Geysers, Cold springs, Freshwater, Wells, Artesian aquifers, Structural geology, Water temperature, Carbon dioxide, Solubility, Hydrogen ion concentration, Chemical analysis, Sampling.
Identifiers: *USSR, Mineral springs, Mineralization, Tectonics.

Silica concentrations in thermal and cold groundwaters were investigated in platform and folded-mountain areas of the USSR and in individual foreign countries. Solubility of silica, modes of its migration in water, and basic factors affecting passage of silica into natural waters are described, and maximum concentrations of silica are given for different groundwater types. The data obtained are important in evaluating the role of groundwater in migration and redistribution of silica in the earth's crust. (Josefson-USGS)

RAPID FIELD DETERMINATION OF NITRATE IN NATURAL WATERS,
Vermont Univ., Burlington. Dept. of Plant and Soil Science.
T. A. Ranney, and R. J. Bartlett.
Commun Soil Sci Plant Anal. Vol 3, No 3, p 183-186. 1972.
Identifiers: *Brucine, *Nitrates, Soils, Soil extracts.

Brucine, an organic reagent used for nitrate determinations, proved stable for at least 1 yr when dissolved in methanol. This makes possible a consistently accurate and rapid method for field determinations of nitrate in clear solutions with a minimum of equipment. The method is also useful in the laboratory for determining nitrate in water or soil extracts. It is quicker and simpler than other colorimetric methods and more sensitive to low concentrations than the nitrate electrode.--Copyright 1972, Biological Abstracts, Inc.

PHOTOSULFOXIDATION OF HYDROCARBONS IN THE LIQUID PHASE,
Battelle Columbus Labs., Ohio.
P. W. Jones, and A. H. Adelman.
Environ Sci Technol. Vol 6, No 10, p 933-934. 1972. Illus.
Identifiers: Carbons, *Hydro carbons, Liquid phase, Oxidation, *Photo sulfoxidation, Quenching, Sulfur.

Aliphatic alkanes and alkenes were irradiated with UV light (Lambda ± or > 2900 A) in the liquid phase, in the presence of SO2 and O2. Both the hydrocarbon reactivity and the nature of products formed in solution show significant similarities to experiments involving aerosols under atmospheric conditions. However, studies in the former system are greatly facilitated by the superior yield of products. The mechanism of triplet SO2 quenching, to form photosulfoxidation products, is duscussed.--Copyright 1973, Biological Abstracts, Inc.

VOLTAMMETRIC STUDY OF THE HYDROGEN ION/HYDROGEN COUPLE IN ACETONITRILE/WATER MIXTURES,
Tennessee Univ., Knoxville. Dept. of Chemistry.
J. A. Lanning, and J. Q. Chambers.
Analytical Chemistry, Vol 45, No 7, p 1010-1016, June 1973. 7 fig, 3 tab, 48 ref.

Descriptors: *Electrochemistry, *Aqueous solutions, Chemical reactions, Chemical analysis, Solvents.
Identifiers: *Perchloric acid, *Voltammetry, *Nonaqueous solutions, *Platinum electrodes, *Mixtures, Acetonitrile, Reproducibility, p-Benzohydroquinone, Proton diffusion coefficients.

A voltammetric study at polished platinum electrodes of perchloric acid in acetonitrile/water mixtures is reported. The half-wave potentials of the proton reduction wave (ferrocene scale) and the viscosity of acetonitrile/water mixtures indicate that acetonitrile structures water in the 0.80 to 0.95 mol fraction of water region. The proton is most difficult to reduce (E sub 1/2 most negative) at 0.85 mol fraction of water. Acetonitrile proved to be a poor solvent for the generation of dry protons. Chemical reactions occur in H (plus)/H2/CH3CN mixtures which depend on the nature of the generation technique employed. Solvent effects effects on the cyclic voltammograms of p-hydrobenzoquinone in acetonitrile-water mixtures were used to aid in the identification of product reduction waves. The wave assigned to the reduction of protonated benzoquinone was independent of solvent composition, in marked contrast to the reduction of solvated protons. (Holoman-Battelle)

INSTRUMENTAL AND NUMERICAL CONSIDERATIONS FOR ON-LINE INTERPRETATION OF HIGH RESOLUTION MASS SPECTRAL DATA,
Wisconsin Univ., Madison. Dept. of Chemistry.
R. M. Hilmer, and J. W. Taylor.
Analytical Chemistry, Vol 45, No 7, p 1031-1045, June 1973. 9 fig, 5 tab, 23 ref.

Descriptors: *Data processing, *Computer programs, *Mass spectometry, *Pollutant identification, Computers, Electronic equipment, Instrumentation.
Identifiers: Mass spectra.

Several important instrumental characteristics of an AEI-MS9 double focusing mass spectometer in the Nier-Johnson configuration are discussed which influence the choice of techniques for on-line data acquistion and numerical methodology for high resolution mass spectral data processing. The approach described yields an average error of less than 10 ppm in mass measurement, and peaks as small as 0.05 percent of the tallest peak are observed. Instrument vibration raises the average mass error. Values below 3 ppm are obtained from data where vibration isolation has been attempted. The time of execution of the data reduction is about 3-10 min on the Raytheon 706 computer, and about 15-60 sec per spectrum on the Univac 1108. The computing times depend on the number of multiplet peaks to be deconvoluted, the number of peaks in the spectrum, and the number of atoms allowed in the elemental formulas. (Little-Battelle)

SOLUBLE SILICA AND FLUORIDE IN SOME SURFACE AND GROUND WATERS OF MYSORE STATE,
University of Agricultural Sciences, Bangalore (India). Dept. of Chemistry and Soils.
P. B. Deshpande, and B. V. Venkata Rao.
Mysore J Agric Sci, Vol 6, No 2, p 107-113, 1973.
Identifiers: *Fluorides, Ground (Water), *India (Mysore), *Silica, Surface waters.

The pH, electrical conductivity, soluble silica and soluble fluoride were studied in relation to the geologic nature of the area. Well waters were slightly acidic or neutral in reaction; well waters located in granite and granite-gneissic area had a high fluoride concentration. Soluble silica in most of the ground waters was more than 2.0 ppm, an indication the equilibration of waters with the 2-phase system of kaolinite-montmorillonite formed during the weathering of silicate minerals. Tank waters were characterized by low silica content due to precipitation of soluble silica with calcareous or ferruginous sediments over which the impounded waters traverse.--Copyright 1973, Biological Abstracts, Inc.

BIOLOGY OF ROCK CRAB (CANCER IRRORATUS) IN NORTHUMBERLAND STRAIT,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
D. J. Scarratt, and R. Lowe.
J Fish Res Board Can. Vol 29, No 2, p 161-166. 1972. Illus.
Identifiers: Biology, Cancer-Irroratus, *Crabs, Mussels, *Canada (Northumberland Strait), Polychaetes, Populations, Prey, *Rock crab, Sea-Urchin, Starfish.

Divers hand-collected 342 C. irroratus ranging from 4.2 mm carapace width to 97 mm (females) and 127 mm (males). The sex ratio (1.37:1) was biased in favor of males. Of 2929 crabs taken in commercial lobster fishing gear, 92% were above the minimum commercial size of 89 mm, and of these 99.1% were male. Smallest size at maturity was 69 mm for females and 60 mm for males. Breeding occurred in late summer and fall. Larvae were present in surface waters from June to Sept. Pey of crabs >25 mm consisted principally of polychaetes, mussels, starfish, and sea urchins. Crabs less than about 65 mm inhabit rocky areas; larger crabs move out onto sand and mud. The

fishable population is probably not in significant competition with lobsters for food or space.–Copyright 1972, Biological Abstracts, Inc.

CHARACTERISTIC PHYSICAL AND BIOGENIC SEDIMENTARY STRUCTURES IN GEORGIA ESTUARIES,
Skidaway Inst. of Oceanography, Savannah, Ga.
J. D. Howard, and R. W. Frey.
American Association of Petroleum Geologists Bulletin, Vol 57, No 7, p 1169-1184, July 1973. 10 fig, 36 ref. NSF Grants GA-719 and GA-10888.

Descriptors: *Estuaries, *Georgia, *Sedimentary structures, Sand waves, Ripple marks, Sedimentology, Benthos, Sedimentation, Particle size, Sands, Silts, Mud, Gravels, Salt marshes.
Identifiers: *Bioturbation.

Estuaries of the Georgia coast contain a wide variety of sedimentary textures and physical and biogenic sedimentary structures. Sediment grain sizes range from fine mud to pebbles. Physical sedimentary structures include small- to large-scale sets of parallel-, ripple-, and cross-laminae. Biogenic structures include abundant burrows and bioturbations by many marine invertebrate organisms. Very fine-grained sediments tend to accumulate near the ocean, regardless of substantial sand sources far upstream. Pleistocene sand outcrops are very important locally, expecially near the ocean. Tests and shells generally are scarce. Ebb-current flow structures predominate over flood-current flow structures. Diversity and abundance of biogenic sedimentary structures decrease both landward and toward the deeper parts of estuarine channels. Muds generally contain distinct burrows, whereas sands may contain both discrete burrows and more general bioturbation. (Knapp-USGS)

LONG WAVE PROPAGATION IN IDEALIZED ESTUARY,
Birmingham Univ. (England). Dept. of Civil Engineering.
D. W. Knight.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY7, Paper 9842, p 993-1007, July 1973. 13 fig, 3 ref, append.

Descriptors: *Estuaries, *Waves (Water), *Tides, *Seiches, Numerical analysis, Unsteady flow, Tidal waters, Model studies, Equations, Hydrodynamics.

An analytical solution is given for equations written by Proudman to describe motion in an idealized estuary. In the idealized estuary, the channel is horizontal, of constant rectangular section, closed at one end and open at the other to tidal influence. The motion is one-dimensional, and the solution includes the effects of both the convective acceleration and friction terms. The solutions are developed in terms of working expressions for the tidal elevation and velocity at any point in the estuary. The limitations of this second-order solution are given in graphical form, in terms of four dimensionless numbers. Finally, the solution is compared with that obtained by solving 'Telegraphers' equation, and Proudman's solution is found to be more satisfactory. (Knapp-USGS)

Descriptors: *Coasts, *Geomorphology, *Land forming, *Mexico, *Pacific Ocean, Gulfs, Beaches, Littoral drift, Ocean waves, Ocean currents, Tidal effects, Waves (Water), Correlation analysis.
Identifiers: *Baja California (Mexico), *Gulf of California.

The coast of Baja California, Mexico, experiences two zonal process environments: the high-wave-energy Pacific coastal environment and the low-wave-energy, structure-dominated Gulf of California coastal environment. Both zones exhibit characteristic coastal landscapes reflecting the zonal environments. Along the Pacific coast a combination of high wave power, unidirectional littoral drift, and a series of right-lateral strike-slip faults parallel to the deepwater wave power results in extensive unbroken beaches and barrier-lagoon complexes alternating with rocky cliffs. Intrazonal variability is less pronounced along the Gulf of California coast. Because it is adjacent to a plate spreading center, this coast is tectonically juvenile, lacking a continental shelf and having precipitous offshore slopes. This situation, combined with the fact that waves are weak and variable in direction, has yielded a straight, cliffed coastline without long beaches. (Woodard-USGS)

OBSERVATIONS OF INTERMEDIATE AND SMALL SCALE TURBULENT WATER MOTION IN A STRATIFIED ESTUARY (PARTS I AND II),
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
R. C. Seitz.
Available from NTIS, Springfield, Va. 22151 as AD-756 252 - Price $3.00 printed copy; $1.45 microfiche. Technical Report 79, Reference 73-2, January 1973. 247 p, 24 fig, 13 tab, 83 ref, 2 append. NOAA N00014-67-A-0163-0006.

Descriptors: *Estuaries, *Turbulent flow, *Stratified flow, *Current meters, *Maryland, Tidal streams, Flow measurement, Density stratification, Instrumentation, Remote sensing.
Identifiers: *Patuxent estuary (Md), Doppler shift current meter.

In May 1967 a series of measurements of 3-dimensional convected turbulent flow (scales of motion ranging from greater than 100 meters to 0.1 meters) were made in the Patuxent estuary, Maryland, with a 3-axis doppler shift (acoustic) type of current meter. Experimental design, instrumentation doppler meter noise, hydrography, and a general theory for sampling of convected fields of turbulence are discussed. The study is also concerned with the general theory of 3-dimensional fields of turbulence in stratified estuaries and the results of extensive spectral and statistical calculations on five of the records of turbulence. The effects of the estuary boundary are shown in the low wave number anisotropy; spectrally local anisotropy induced by the field of stratified density in the estuary is also shown and quantitatively related to the amount of density stratification at the depth of observation. The likelihood of high wave-number isotropic turbulence is shown and the transition wave-number denoting its onset is emperically related to the local Richardson number of the flow. Five of the doppler meter records were computer filtered so that the characteristics of the high wave-number velocity field could be determined; noted amounts of patchiness or intermittency of the filtered records of velocity was observed. The flatness of the filtered velocity records increased rapidly as a function of the local Richardson number. The structure of the average 'patches' of turbulence together with other characteristics of the small-scale motion in the estuary is discussed in terms of the theory for shear instability. (Woodard-USGS)

THE COMPUTATION OF TIDES AND CURRENTS IN ESTUARIES AND CANALS,
Massachusetts Inst. of Tech., Cambridge. Hydrodynamics Lab.
D. R. F. Harlemen, and C. H. Lee.
Available from NTIS, Springfield, Va. 22151 as AD-756 136 - Price $3.00 printed copy; $1.45 microfiche. Army Corps of Engineers Committee on Tidal Hydraulics Technical Bulletin No 16, September 1969. 276 p, 105 fig, 5 tab, 43 ref, 3 append. ACE DA-22-079-civeng-66-17.

Descriptors: *Hydrologic aspects, *Estuaries, *Canals, *Tidal effects, Analytical techniques, Numerical analysis, Equations, Channel morphology, Saline water intrusion, Currents (Water), Runoff, Flow rates, Diurnal, Water level fluctuations, Tides, Tidal streams, Inland waterways, Computer programs.

The analysis of one-dimensional tidal motion is described in the two principal types of tidal waterways: (1) estuaries open to the ocean at one end and merging with a river at the opposite end; and (2) canals or waterways connecting two independent tidal bodies. The objectives were to classify tidal problems. The primary concern was with analytical and numerical methods rather than with analog and physical models. In general, only one-dimensional methods were considered since these are adequate for many practical problems. Tidal motion in a canal or estuary can be described by two equations, one expressing the conservation of mass (the continuity equation), and the other expressing the dynamic equation of motion in the longitudinal direction (the momentum equation). The various ways of dealing with these two equations are: (1) harmonic methods; (2) method of characteristics; and (3) finite difference methods. The nonlinear, finite difference method proved to be the most satisfactory for solution of one-dimensional tidal hydraulic problems. Seven case studies are given to demonstrate the versatility of the method in both prismatic and irregular channels, in closed and open end estuaries and sea level canals. The diagonal mesh computation method using an explicit scheme results in relatively simple computer programs and efficiency in computer time. Computer programs have been developed for closed end estuaries, open end estuaries, and sea level canals. (Woodard-USGS)

CLASSIFICATION OF COASTAL ENVIRONMENTS, PROCEDURES AND GUIDELINES,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
R. Dolan, and B. P. Hayden.
Available from NTIS, Springfield, Va 22151 as AD-757-798 Price $3.00 printed copy; $1.45 microfiche. Technical Report No 2, February 1973. 41 p, 2 fig, 6 tab, 21 ref. ONR N00014-69-A-0060-0006.

Descriptors: *Coasts, *Geomorphology, *Classification, Climate, Air masses, Land forming, Environment, Environmental effects, Sediment transport, Beach erosion, Littoral drift, Geology.

Considerable work in the analysis and classification of coasts from a geologic or geomorphologic perspective has been reported. The best information available is descriptive, and it was decided that those descriptive attributes which reflect and are responsive to ongoing processes form a solid base for the classification of coastal interfaces. Three attribute classes of the coastal interface were found to be reflective of ongoing interface processes: gross form of the coastal interface; chemical composition of the coastal interface; and size character of interface materials. All coastal interfaces have each of these three attributes and differ only in specifics. Some coastal interfaces have two attributes such as sand and rock material sizes in a specific configuration as in a coast of pocket beaches or sand beaches with rock headlands. In these cases both characters are included in the classification. In total, 15 classes of interfaces were found. (Woodard-USGS)

BACTERIA OF MUDS COLONIZED BY SPARTINA TOWNSENDII AND THEIR POSSIBLE ROLE IN SPARTINA DIE-BACK,
Commonwealth Mycological Inst., Kew (England).
A. Sivanesan, and J. G. Manners.
Plant Soil. Vol 36, No 2, p 349-361, 1972. Illus.
Identifiers: *Bacteria, *Muds, *Spartina-M dieback, Spartina-Townsendii-M, *England (Lymington estuary), Estuaries.

A study of the bacterial microflora of muds colonized by Spartina townsendii agg. in healthy and 'die-back' sites in the Lymington estuary was made. No important qualitative differences were found between the microfloras of the 2 types of site. Fewer species, however, were present in the die-back sites. It is suggested that under anaerobic conditions, such as occur in a 'die-back' site, the bacteria will utilize such oxygen as is present, and will then engage in anaerobic metabolic processes, producing reduced ions which will reduce the oxidation-reduction potential still further. The occurrence of abundant sulfate reducers in the 'die-back' sites may be particularly significant in this respect. No evidence was obtained of any more direct relationship between bacterial flora and the development of 'die-back'.--Copyright 1972, Biological Abstracts, Inc.

PREDICTION OF UNSTEADY SALINITY INTRUSION IN ESTUARIES: MATHEMATICAL MODEL AND USER'S MANUAL,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
M. L. Thatcher, and D. R. F. Harleman.
Available from NTIS, Springfield, Va 22151 as COM-73-10543 Price $3.00 printed copy; $1.45 microfiche. Massachusetts Institute of Technology Sea Grant Project Office Report No MITSG 72-21, November 30, 1972. 117 p, 11 fig, 7 tab, 5 ref, 3 append. NOAA Sea Grants GH-88 and 2-35150.

Descriptors: *Saline water intrusion, *Estuaries, *Mathematical models, *Computer programs, Input-output analysis, Tidal effects, Streamflow, Discharge (Water), Water levels, Forecasting, Systems analysis, Programming languages, Methodology.
Identifiers: FORTRAN programming.

A computer program is presented for the implementation of the mathematical model for the prediction of unsteady salinity intrusion in estuaries. The model is one-dimensional, although varying degrees of stratification are accounted for in the assumed longitudinal dispersion relationship. The purpose of this manual is to enable researchers and engineers to use the computer program in an effective manner without requiring that they have other than a fundamental understanding of how digital computers accept input data, execute logical and numerical instructions, and present calculations in readable form. Although a knowledge of FORTRAN programming is helpful, it is not considered necessary for the prospective user of this program. However, to avoid unnecessary computing expense, it is recommended that a user not familiar with computer applications seek the assistance of someone who is experienced when it comes to the actual execution of the computer program. BIOGEOCHEMISTRY OF SEDIMENTS OF DELAWARE BAY,
Delaware Univ., Newark. Coll. of Marine Studies.
F. M. Swain.
Available from NTIS, Springfield, Va 22151 as COM-73-10415 Price $3.00 printed copy; $1.45 cents microfiche. DEL-SG-8-72, December 1972. 44 p, 3 fig, 20 tab, 5 ref. NOAA Sea Grant 2-35223.

Descriptors: *Sedimentology, *Bays, *Delaware River, *Biochemistry, *Geochemistry, Sediments, Chemical analysis, Sampling, Data collections, Organic matter, Ecology, Ecosystems, Benthos, Environmental effects, Dredging, Sedimentation.
Identifiers: *Delaware Bay.

Surface Holocene sediment samples from middle Delaware Bay and cored Holocene samples from lower Delaware Bay were studied for general sediment characteristics, pH, Eh, organic carbon, hydrogen, carbohydrates, amino acids, hydrocarbons, chlorophyll-derived pigments, carotenoid pigments, and humic acids. Samples from a core near Wilmington Canyon on the continental slope off Delaware Bay were analyzed for organic carbon, hydrogen, and total carbohydrates. The middle bay sediments of fine sands, silts, and clays are locally reducing and contain moderate amounts of organic residues. The middle bay is to some extent a settling area for organic matter, but a great deal of the suspended organic matter bypasses to the open sea. The lower bay sediments of sands and silty and clayey sands are possessed of a more generally oxidizing environment and contain, in most instances, less organic matter than the middle bay. The lower bay appears to be primarily a bypassing rather than a settling area for organic matter. The analytical data are tabulated. (Woodard-USGS)
W73-12739

HISTORY OF SEDIMENTATION IN MONTSWEAG BAY,
Maine Univ., Walpole. Ira C. Darling Center for Research, Teaching and Service.
D. Schnitker.
Maine Geological Survey Bulletin No 25 (Contribution No 43 from I.C. Darling Center, Maine University), 1972. 20 p, 19 fig, 3 ref.

Descriptors: *Estuaries, *Maine, *Sedimentation, Provenance, Tides, Sampling, Sounding, Seismic studies, Swamps, Sediment transport, Tidal waters.
Identifiers: *Montsweag Bay (Maine).

Montsweag Bay at the central Maine coast is a deeply excavated bedrock valley that has largely been filled by sediments. The deeper portions of the bedrock valley are filled by a Pleistocene blue clay which is disconformably overlain by thick Holocene sediments. Sediments were dated by radiocarbon and pollen analyses. Sedimentation rates for the last 250 years varied between 1.15 and 1.9 cm per year, increasing towards the present. These figures compare with observed sedimentation rates of 1.9 to 2.8 cm per year. The sediment accumulating in Montsweag Bay can be entirely accounted for by the influx of suspended matter with each tidal cycle through the southern entrance to the bay. Montsweag Bay is near its terminal stage of becoming a salt marsh. (Knapp-USGS)

Descriptors: *Coasts, *Environmental effects, *Classification, *Africa, Climates, Vegetation, Waves (Water), Shores, Geomorphology, Topography, Beaches, Littoral drift, Sands, Particle size, Beach erosion, Currents (Water), Ocean currents, Correlation analysis, Marine geology.
Identifiers: *Coastal environments.

As defined in this classification, the coastal environment has two common attributes: (1) a fluid environment consisting of both atmospheric and marine components, and (2) an interacting coastal interface system. Each attribute was classified independently prior to the integration of the components into the Classification of the Coastal Environments of the World, Part II: Africa. The atmospheric environment was treated using the methodology of air mass climatology, and the marine system was classified using water-mass analysis with modifications appropriate to nearshore conditions. The classification of shoreline interfaces was developed by detailed analysis of coastal landforms. Coastal vegetation was analyzed and distributions were compared with the physical components of the system. Close agreement was found between the biotic and physical environments, which served to verify the methodology employed. The existence of both north-south and east-west hemispheric symmetry at all levels accounts for the high degree of internal coupling among the processes operative within the coastal zone. The similarities and differences between the coastal environments of Africa and those found in the earlier study of the Americas are discussed and causal factors explored. (Woodard-USGS)

HEAT-EXCHANGER FOR DESALTING SEA WATER,
Societa Italiana Resine S.P.A., Milan (Italy). (assignee)
D. Barba, G. Liuzzo, G. Tagliaferri, and A. Germana.

U.S. Patent No. 3,735,808, 3 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1562, May 29, 1973.

Descriptors: *Patents, *Desalination apparatus, *Sea water, Saline water, Equipment, *Heat exchangers, Evaporation, *Condensation, Potable water, Water treatment.

The object is an improvement relating to instantaneous multiple expansion evaporators. A nest of tubes is rendered rigid with a hollow cylinder which is passed through a single hole provided in the separating baffle so that a high degree of tightness is achieved between the cylinder and the hole. Each tube of the nest is located in apertures predisposed in the circular walls of the cylinder, and therefore rendered rigid with the cylinder itself. Sea water is preheated before being introduced into the chambers by causing it to pass as cooling liquid through heat-exchanger tubes. The vapor formed condenses on nests of heat exchanger tubes which longitudinally traverse the entire length of the evaporator and the condensate is collected so that it cannot come in contact with the saline solution. THE INTERRELATIONSHIPS OF THE VEGETATION CHARACTERS OF FOUR SALT DESERT SHRUB ASSOCIATIONS OF COLORADO PLATEAU,
Pakistan Forest Inst., Peshawar.
K. M. Ibrahim, and D. L. Goodwin.
Pakistan Journal of Forestry, Vol 21, No 2, p 121-132, April 1971. 5 tab, 11 refs.

Descriptors: *Desert plants, *Correlation analysis, *Shrubs, Colorado, Plant populations, Range grasses, Arid lands, Range management, Watershed management, Planning, Livestock, Sediments, Reclamation, Colorado River.
Identifiers: *Colorado Plateau, *Saltbush.

In planning range and watershed management of the Colorado Plateau region, four distinct salt desert shrub associations were identified and studied: Atriplex confertifolia -- Hilaria jamesii; Atriplex nuttallii var. nuttallii; Atriplex nuttallii var. gardneri -- Aster xylorrhiza; and Atriplex corrugata. Simple correlation coefficients, used to show the interrelationships between the vegetation characters of the plant communities, indicate: (1) In the Atriplex confertifolia -- Hilaria jamesii association, an increase in shrub cover might reduce the perennial grass cover; (2) in the Atriplex nuttallii var. nuttallii -- Hilaria jamesii association, an increase of shrub cover probably will reduce the cover of perennial grasses and annuals; (3) in the Atriplex nuttallii var. gardneri -- Aster xylorrhiza association, the presence of shrubs may decrease the cover of annuals; and (4) in the Atriplex corrugata association, an increase of shrub cover would affect adversely the cover of perennial grasses, annuals, and cryptogams. The study is of particular importance for this arid region, not only because this is a major wintering area for livestock, but also because the Colorado Plateau region produces considerable unwanted sediment which affects reclamation developments on the Colorado River. EFFECT OF QUALITY OF WELL WATERS ON THE GERMINATION AND MINERAL COMPOSITION OF WHEAT ON SALINE-SODIC SOILS RICH IN MAGNESIUM,
Banaras Hindu Univ., Varanasi (India). Dept. of Soil Science and Agricultural Chemistry.
S. Singh, and R. S. Singh.
J Indian Soc Soil Sci. Vol 19, No 4, p 383-388. 1971.
Identifiers: Germination, *India (Bihar), *Magnesium, Minerals, *Saline sodic soils, *Wheat-M, Well water.

Some important characteristics of salt-affected well waters and their impact on the germination and chemical composition of wheat on saline-sodic soils rich in Mg in south western tracts of Bihar were studied. Most of the well waters contain more soluble Mg than Ca. The concentration of Na, CO3 and HCO3 is also very high. The characteristics of well waters like electrical conductivity, Na adsorption ratio, soluble Na percentage, and residual Na carbonate are significantly correlated (negatively) with germination percentage. The correlation between soluble Ca percentage and germination percentage is positively correlated. Positive correlations exist between soluble Na percentage of water and Na of plants. Na+Mg/Ca of irrigation water is positively (significantly) correlated with Na and Mg. A prediction value (Na+Mg/Ca) has been evolved for judging the quality of well waters on the basis of adverse effect of Na and Mg and favorable effect of Ca on the germination. The predicted value is highly correlated (negatively) with germination percentage.--Copyright 1972, Biological Abstracts, Inc.

ANNUAL REPORT OF THE NEW YORK STATE URBAN DEVELOPMENT CORPORATION, 1972.
New York State Urban Development Corp., New York.

1972. 112 P, 16 FIG, PHOTO, 11 TAB.

Descriptors: *Floods, *Flood damage, *Urban renewal, *Chemung River, Planning, Flood control, Flood protection, *New York.
Identifiers: *Urban Development Corporation, *Hurricane Agnes, Chemung Valley, Temporary housing, Housing, Elmira (New York), Corning (New York).

The Urban Development Corporation, a state agency created by the New York legislature in 1968 to develop and finance low and middle income housing, to assist industrial and commercial development, and to help provide various civic facilities, works closely with local officials and citizen groups and attempts to be a catalyst for private development. The UDC's programs for 1972 are described. UDC response to the worst flooding in history in the Chemung Valley in late June, 1972, largely as a result of Hurricane Agnes, is discussed. Flood waters crested 12 feet higher than the protective dikes and levees and the cities of Elmira and Corning plus several small towns were devastated. Flood control measures are being studied to avoid reoccurrences of '72 disasters. Raising of dikes, dredging of Chemung River and construction of two Pennsylvania upstream dams is expected to substantially safeguard the entire Valley from future major flooding. The UDC played a key role in the federal mobile home program for temporary housing and immediately began working with the communities on urban renewal plans and programs. The urgency of the situation and the ability of UDC to act quickly have resulted in several completed plans and construction starts. (Elfers - North Carolina)

COMPREHENSIVE PUBLIC WATER SUPPLY STUDY FOR SCHENECTADY COUNTY, NEW YORK.
Parsons, Brinckerhoff, Quade and Douglas, Inc., New York.

Prepared for the Schenectady County Board of Representatives. Summary report. March 1970. 18 p, 3 maps, 7 tab. N.Y. State Dept. of Health CPWS-56.

Descriptors: *Water supply, *Planning, Administration, Financing, Water demands, Water rates, *New York, *City planning.
Identifiers: *Schenectady (New York), Water supply system expansion, Systems consolidation.

Since Schenectady County has adequate water supplies for the near future, planning is discussed for the orderly development and distribution of these supplies including the expansion and consolidation of existing systems to meet new demands efficiently. Focusing on the Schenectady Metropolitan Area and the Delanson-Duanesburg area, the study includes projections of population and water demands, inventories of existing systems and available water supply sources, examination of local water quality problems, and analyses of alternative development and expansion plans. It is recommended that all the public water systems in the Schenectady area be consolidated into a single system and that immediate steps be taken to increase and improve local supplies in the Delanson-Duanesburg areas. A proposed financing plan, including a new water rate schedule, and a plan for implementation, are outlined. (Elfers - North Carolina)

PETROLEUM...40 YEARS OF RESEARCH,
Secony Mobil Oil Co., Inc., New York.
D. H. Clewell.

Industrial Water Engineering, Vol 3, No 1, p 20, 21, 61, 62, January 1966.

Descriptors: *Pollution, Waste water disposal, *Waste water treatment, *Oil industry, Education, Professional societies, Universities, Recycling.

The petroleum industry has been working on various phases of water conservation for nearly 40 years. In 1927 after an American Petroleum Institute (API) study indicated the growing seriousness of public water supply pollution, the Institute formed a committee to collect, develop, and publish needed technical information on the disposal of refinery wastes. Over the intervening years the API has sponsored many research projects at universities and independent research institutions; several of the current projects are discussed. Most water pollution problems can be traced to society's expanding wants and needs and no segment can be singled out as the source of pollution problems, therefore water problems must be solved in a spirit of cooperation. AQUEOUS IRON-SULFUR SYSTEMS IN RICE FIELD SOILS OF LOUISIANA,
Alabama Univ., Birmingham. Inst. of Dental Research.
G. Pitts, A. I. Allam, and J. P. Hollis.
Plant Soil. Vol 36, No 2, p 251-260. 1972. Illus.
Identifiers: Aqueous solutions, *Louisiana, *Rice-M fields, Soils, Sulfur, *Iron-sulfur solutions.

A phase diagram of an aqueous Fe-S system constructed from thermodynamic data for initial concentrations of 100 ppm H2S and 100 ppm Fe permitted the prediction that the principal precipitate found in the Eh-pH range of flooded Louisiana rice paddies would be FeS2. Analysis of precipitates formed in the laboratory at Eh and pH levels simulating paddy conditions showed that both FeS2 and FeS were present; however, more FeS than predicted was actually precipitated in the FeS2 field by dominance. A multiparameter diagram for an aqueous system was constructed relating equilibrium Fe concentration, Eh, pH and the equilibrium H2S concentration (that H2S which is in equilibrium with precipitated sulfides). It was demonstrated from the diagram and associated thermo-dynamic equations that the H2S±FeS2 equilibrium predicts theoretical values of H2S in agreement with experimental values of H2S from rice paddy soil samples.--Copyright 1972, Biological Abstracts, Inc.

CONSUMPTIVE USE OF WATER BY DWARF WHEAT IN UDAIPUR VALLEY,
Udaipur Univ. (India). Coll. of Agriculture.
S. P. Srivastava.
Indian J Agric Sci. Vol 42, No 2, p 152-155. 1972.
Identifiers: Ammonium, *Consumptive use, Evapotranspiration, India (Udaipur Valley), Nitrates, Sulfates, Transpiration, Triticum-Aestivum, Water utilization, *Wheat (Dwarf).

An irrigation-and-manurial trial with wheat (Triticum aestivum L.) cultivar 'S 227' was conducted on mixed black soil. The mean total consumptive use was 395 and 519 ha-mm, corresponding to 30 and 60% available soil moisture regime. The mean daily consumptive use was 0.6 ha-mm up to the first irrigation; thereafter, it increased by about 5 times. The evapotranspiration was also estimated from meteorological data through empirical formulae. Application of half of the N at sowing and the remaining half at crown-root-initiation stage proved better. Ammonium sulfate nitrate seemed to be a promising form of N.--Copyright 1973, Biological Abstracts, Inc.

FIELD LEACHING BY SPRINKLER AND SURFACE IRRIGATION DURING A CROP SEASON,
Agricultural Research Service, Brawley, Calif.
L. F. Hermsmeier, and M. T. Kaddah.
Paper 72-723, 1972 Winter Meet Am Soc Agric Eng, Chicago, Illinois, Dec 1972. 20 p, 4 fig, 3 tab.

Descriptors: *Leaching, *Irrigation, *Sprinkler irrigation, *Surface irrigation, *Salt balance, Drainage, Irrigation effects, Application methods, Subsurface drainage, Soil management, Irrigation efficiency, Crop production, Barley, Salinity, Saline soils, *California, On-site tests, Land reclamation, Rates of Application.
Identifiers: *Imperial Valley (Calif.), Salt removal.

Several major disadvantages of leaching a field by ponding water led to considering sprinklers as an alternative. Laboratory tests indicated that leaching by sprinkler irrigation may not only provide more efficient water use, but also save time, since when soil is not saturated, simultaneous leaching and crop production can occur. In Imperial Valley, California, a field experiment was conducted to determine: (1) the relative leaching effectiveness of sprinkling and surface irrigation on barley, and (2) effects of ponding on crop growth and yield. Results of leaching during 2 barley growing seasons indicated that applying excess irrigation water to a winter barley crop can effectively leach salt from the soil, while obtaining high crop yield. Salt removal improved slightly between drains in the top foot of soil when sprinklers were used, but no improvement was noted at a depth of 5 ft. Surface irrigation resulted in increased leaching and gave higher barley yields than sprinkler irrigation. Application of up to 30% excess water with surface irrigation and 67% excess water with sprinklers did not adversely affect yields. (USBR).

ELECTROSTATIC CROP SPRAYING,
Hong Kong Univ.
R. Coffee.
New Scientist, Vol 57, No 830, p 194-196, Jan 25, 1973. 2 fig, 1 photo.

Descriptors: *Pesticides, Pesticide drift, *Spraying, Pest control, Insect control, Environmental effects, Electric fields, Insecticides, Biology, Foreign research, Agricultural chemicals, Agriculture, Crops, Application methods, Pesticide kinetics, Agronomy, Water pollution control.
Identifiers: Spray losses, Hong Kong, Experimentation, *Charged particles, *Dusting, Electrostatic precipitation, *Electrostatics.

Investigations to improve methods of pesticide deposition, reduce the volume of pesticide applied, and lessen the drift problem are reported. One method described uses powerful electrostatic forces to propel and direct pesticide particles onto crop foliage, with a resulting increase in material efficiency, distribution, and retentivity. The basic principles of electrostatic deposition are not complicated. Particles to be deposited are given a unipolar charge as they leave of the vegetation being sprayed. Investigations reveal that even the underside of the leaves is covered with the pesticide. This technique may help solve the pollution problem by enabling more economical material to be used and by introducing a powerful magnetic settling field. The Electrical Engineering Department of Hong Kong University is studying the fundamentals of electrostatic crop spraying and developing 2 promising spraying devices. (USBR)

IMPROVEMENTS IN MOVING SPRINKLER IRRIGATION SYSTEMS FOR CONSERVATION OF WATER,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
D. L. Miles.
Available from the National Technical Information Service as PB-222 267, $3.00 in paper copy, $1.45 in microfiche. Colorado Environmental Resources Center Completion Report Series No. 49, June 1973. 153 p, 41 fig, 12 tab, 53 ref. OWRR-B-039-COLO (7). 14-31-0001-3064.

Descriptors: *Sprinkler irrigation, *Infiltration, *Irrigation systems, Irrigation design, Irrigation practices, Infiltration rates, Mathematical models, *Infiltrometers, Soil surfaces.
Identifiers: *Center-pivot sprinkler.

Self-propelled center-pivot sprinkler systems have become very popular because of their low labor requirements and ability to economically irrigate rolling sandhills. This equipment applies water uniformly to the soil surface, but the water application rates greatly exceed the infiltration capability of most soils causing water to move on the soil surface from local high areas and slopes to nearby low spots. The resulting nonuniformity of irrigation results in reduced crop yields, waste of water, and fertilizer leaching. This problem was investigated using a laboratory infiltrometer, a mathematical model, a field sprinkler infiltrometer, and field investigations under operating systems. Recommendations were developed to reduce of eliminate the problem through improved system design, special field preparation and farming techniques, and improved operating procedures.

INFLUENCE OF DIFFERENT MOISTURE REGIMES AND METHODS OF PHOSPHATE APPLICATION ON GROWTH AND NUTRIENT ABSORPTION BY WHEAT (TRITICUM AESTIVUM L.),
Jawaharlal Nehru Agricultural Univ., Jabalpur (India).
R. B. Sharma, G. P. Verma, and S. S. Khanna.
Indian J Agric Sci. Vol 42, No 1, p 52-56. 1972.

Identifiers: *Nutrient absorption (Plants), *Phosphates, TriticumaAestivum, *Wheat growth, Soil moisture.

The total dry matter and grain yield significantly increased with an increase in the level of soil moisture and by subsurface phosphate placement. However, the interaction between moisture levels and P placement was not significant. A decrease in the supply of soil moisture increased the N and K in the grain but decreased them in the straw. The concentration of P in the grain and straw decreased with a decrease in moisture supply. The placement of P had hardly any definite effect on the concentration of N and K in the grain and straw, but there was an increase in the concentration of P, though it was not statistically significant.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF VARYING WATER MANAGEMENT PRACTICES ON THE GROWTH, YIELD AND NITROGEN UPTAKE BY HIGH-YIELDING RICE VARIETIES,
Indian Agricultural Research Inst., New Delhi. Div. of Biochemistry.
J. E. Shinde, and V. K. Srivastava.
Indian J Agric Sci. Vol 42, No 1, p 57-62. 1972.
Identifiers: Cultivars, Plant growth, *Nitrogen fertilization, Oryza-Sativa, *Rice, Uptake, Water uptake, Yield, Water management (Applied).

The pot-culture experiment with rice (Oryza sativa L.) cv. 'IR 8' and cv. 'Padma' included waterlogging and upland conditions imposed during different growth stages of the plant. The effects of varying water management practices were fully expressed only when the plants were adequately fertilized with N. The highest grain yield and N uptake by the panicle was obtained in 'IR 8' and 'Padma' when waterlogging continued from transplanting to flowering and maximum tillering, respectively. Upland conditions imposed during any growth stage, except ripening, adversely affected the grain yield of 'IR 8', but 'Padma' withstood them better.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF VARIOUS SOIL MOISTURE REGIMES AND DIFFERENT LEVELS OF NITROGEN AND DIFFERENT SPACINGS OF THE QUALITY OF POTATO TUBERS (SOLANUM TUBEROSUM L.),
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
R. S. Narang, and S. S. Kanwal.
J Res Punjab Agric Univ. Vol 8, No 4, p 432-436. 1971.
Identifiers: *Nitrogen, *Potato tubers, Protein, Soils, Solanum-Tuberosum, Spacings, Starch,Tubers, *Soil moisture.

The protein content in tubers increased with each level of available soil moisture (ASM) up to 20% ASM or N (up to 180 kg N/ha), whereas the starch content showed a reverse trend. The variation in spacing from 40 cm x 20 cm to 60 cm x 20 cm did not show any significant influence on either of these 2 quality characteristics. An inverse relationship was observed between the percentage of protein and starch contents of the tubers. The per hectare starch yield, however, was the highest at the highest level of N (180 kg N/ha), as well as at the highest available soil moisture regime (80%). This was because of the overall increased yield of tubers under these treatments. The treatment differences, however, were statistically non-significant.--Copyright 1973,Biological Abstracts, Inc.

THE QUALITY OF DRAINAGE WATER FROM IRRIGATED BLACK COTTON SOILS FOR IRRIGATION,
University of Agricultural Sciences, Siruguppa (India). Agricultural Research Station.
T. G. Bhadrapur, and T. Rao.
Mysore J Agric Sci. Vol 6, No 1, p 28-33. 1972.
Identifiers: Alkalinity, *Drainage water, Evaporation, *Irrigation, Salinity, Soils, Summer, Transpiration, Seepage, *Black cotton soils.

The Thungabhadra Project canal, its drainage and seepage waters were analyzed periodically for 1 yr to assess their suitability for irrigation. Both waters had high salt levels insummer months, seepage water is used for heavy irrigation with adequate drainage facilities; otherwise there is risk from both salinity and alkalinity hazards.--Copyright 1973, Biological Abstracts, Inc.
W73-12650

VARIABILITY OF RAINFALL AND AGRICULTURAL EFFICIENCY OF SHOLAPUR DISTRICT,
Sholapur Coll. (India). Dept. of Geography.
T. P. Patil.
J Shivaji Univ. Vol 4, No 7/8, p 101-107. 1971. Illus.
Identifiers: Agriculture, *India (Sholapur), Jowar, *Rainfall.

District Sholapur a semiarid part of Maharashtra receives scanty and varying amount of rainfall. Year round high temperature accounts for high water deficiency. Irrigation is insignificant, hence almost all crops are rainfed. Rains early, late and widely distributed result in changing crop pattern and acreage. Mean annual rainfall figures do not reflect the reliability of rainfall at a place, because they represent the mean of widely scattered figures on either side of the mean. Reliability is tested by coefficient of variability. A sound correlation exists between variability of rainfall and variability of gross cropped acreage. Similar relation is likely to exist between variability of rainfall and 'Rubi' jowar acreage.--Copyright 1973, Biological Abstracts, Inc.
W73-12659

EFFECT OF COMPACTION ON YIELD AND UPTAKE OF N, P AND K BY MAIZE (ZEA MAYS L.),
Jawaharlal Nehru Agricultural Univ., Jabalpur (India).
G. P. Verma, and R. B. Sharma.
JNKVV (Jawaharlal Nehru Krishi Vishwa Vidyalaya) Res J. Vol 6, No 1, p 16-20. 1972. Illus.
Identifiers: Bulk, Compaction, Density, *Maize, *Nitrogen, *Phosphorous, *Potassium, Yield, Zea-Mays.

Studies were conducted on 4 soil series of Malwa Plateau, Malwa Plateau, Madhya Pradesh. In the Kheri series, loosening the soil to a bulk density was useful whereas compaction considerably reduced the growth and absorption of nutrients. For the Kamaliakheri and Runija soil series, the natural bulk density was the optimum for maize whereas for the Unhel soil series, compaction of the soil to a bulk density of 1.40 g cm-3 increased the growth and absorption of nutrients. The compaction of soil to create a bulk density > 1.40 g cm-3 proved harmful for plant growth in all soil series. The harmful effect of compaction seemed to be due to reduction in the absorption of nutrients.--Copyright 1973, Biological Abstracts, Inc.
W73-12660

ANNUAL WATER BALANCE AND AGRICULTURAL DEVELOPMENT IN ALASKA,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
J. E. Newman, and C. I. Branton.
Ecology. Vol 53, No 3, p 513-519. 1972. Illus.
Identifiers: Agricultural development, *Alaska, Annual, *Crop production.

Mean annual precipitation in Alaska varies from 10 cm in the north to well over 500 cm in the southeast. Much of the interior has a macro-scale negative mean water balance, whereas coastal areas are very humid. Most land areas with the potential for agricultural development lie along the major interior river valleys. Nearly all of these land areas have long-term negative water balances. Should agricultural development take place in these areas, this negative water balance is likely to be magnified. Only those potential agricultural lands in the Kenai Peninsula, Kodiak-Aleutian Island chain, and the southeast coastal regions lack water limitations when subjected to intensive crop production.--Copyright 1973, Biological Abstracts, Inc.
W73-12664

SOIL NITROGEN BALANCE IN SELECTED ROW-CROP SITES IN SOUTHERN CALIFORNIA,
California Univ., Riverside. Dept. of Soil Science.
D. C. Adriano, F. H. Takatori, P. F. Pratt, and O. A. Lorenz.
J Environ Qual. Vol 1, No 3, p 279-283. 1972. Illus.
Identifiers: *California, Crop sites, Denitrification, Drainage, *Fertilization, Irrigation, Nitrate, *Nitrogen, Soils, Row crops.

Nine row-crop sites, where data for N fertilizer use, crop yields, and amounts of irrigation water used were available for a number of years, were studied to estimate the N balance as related to NO3- in water in the unsaturated zone from below the zone of root influence to the water table or to the 15-m depth. The system of predicting NO3- concentrations in drainage waters based on the difference between N inputs and N removal in harvested crops and the drainage volume in which the excess N, converted to NO3-, is dissolved, was valid in open-porous soils containing no layers that restrict water movement within the soil profile (0- to 2-m depth). A combination of losses plus net immobilization of up to 56% had to be assumed in some soils to account for all the N loss. In 2 soils that had been used for disposal of feedlot manure, net mineralization of N from the organic N pool had to be assumed to explain the data obtained. The current fertilization and irrigation practices used for some row crops in southern California leave varying amounts of NO3- in the drainage water. The amounts depend on the total N added, crop removal, drainage volume, net mineralization and losses.--Copyright 1973, Biological Abstracts, Inc.

ECONOMICS IN SOIL AND WATER CONSERVATION,
Iowa State Univ., Ames. Dept. of Economics.
J. F. Timmons.
Iowa Agriculture and Home Economics Experiment Station, Ames, Journal Paper No. J-6470, 1972. 3 p. OWRR A-036-IA (6).

Descriptors: *Soil conservation, *Water conservation, *Economic efficiency, Project planning, Decision making, Productivity, Benefits.
Identifiers: Marginal analysis, Multipurpose activities, Externalities.

Protection of the soil and water resource base to maintain high agricultural productivity requires selection of type and amount of public resources to be used for resource management and investment and choice of soil and water practices on the basis of cost-benefit criteria. Using simple graphical analysis a method is illustrated for determining the amount of investment required to maintain a chosen productivity level and the success of past conservation investments. Selection of conservation practices should be based upon marginal analysis. It is important that this same analysis be applied to the selection of a multipurpose activity. Thus, investments in each of the various purposes will be determined to maximize the return to each

purpose. Despite the economic logic behind the use of marginal analysis in investment decisions, Federal flood control legislation requires only that benefits exceed costs. Watershed, basin and district organizations attempt to internalize the externalities associated with conservation practices. (Weaver-Wisconsin)

WATER METABOLISM IN DESERT SHEEP, EFFECTS OF VARIOUS DEGREES OF WATER RESTRICTION ON THE DISTRIBUTION OF BODY WATER IN MARIWARI SHEEP,
Central Arid Zone Research Inst., Jodhpur (India). Div. of Animal Studies.
F. R. Purohit, P. K. Ghosh, and G. C. Taneja.
Australian Journal of Agricultural Research, Vol 23, No 4, p 685-691, July 1972. 2 fig, 3 tab, 15 ref.

Descriptors: *Animal metabolisms, *Water requirements, *Dehydration, *Animal physiology, *Drought tolerance, Sheep, Arid lands, Deserts, Livestock, Water shortage, Water utilization, Drought resistance, Adaptation, Weight.
Identifiers: *India (Rajasthan), Water deprivation, Body fluids, Mariwari breed.

The most crucial limiting factor for the survival of livestock in the arid and semiarid tracts of western Rajasthan in northwest India is the chronic scarcity of drinking water. During critical periods many stock growers try to save their flocks by transhumance, but mostly the animals must depend on their physiological ability to withstand water deprivation. Effects of various degrees of water restriction on the distribution of body water in Mariwari sheep, one of the hardiest breeds in the Rajasthan desert, are discussed. These sheep are able to withstand a dehydration loss of about 18 percent in body weight, evidence that they are reasonably well adapted to water deprivation. When the water intake was reduced below 75 percent of the normal daily requirement, the total body water, total blood and plasma values, and the extracellular, intracellular, and interstitial fluid volumes of the sheep began to decrease. A reduction to 25 percent normal intake was similar in its effect to complete deprivation, with plasma volume falling by 43 percent and the extracellular fluid volume by 33 percent. However, the animals do not have the ability to maintain an expanded plasma volume against general dehydration. (Gloyd-Arizona)

EFFECT OF LEVEL OF SOIL MOISTURE ON NITROGEN MINERALIZATION AND NITRIFICATION DURING INCUBATION OF EAST PAKISTAN TEA SOILS,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
M. Ishaque, and A. H. Cornfield.
Bangladesh J Biol Agric Sci. Vol 1, No 1, p 52-58. 1972.
Identifiers: *East Pakistan, Incubation, Microbial activity, Mineralization, *Nitrification, Nitrogen, Soils, Tea soils, *Soil moisture.

The effects of varying static moisture contents (20-100% maximum water holding capacity, mwhc) on levels of mineral-N (NH4- and NO3-N) during incubation at 30C for 2, 5 and 12 wk of low flat (LF) and high flat (HF) tea soils (pH 4.1 and 4.2) were studied. The optimum moisture content for mineral-N accumulation after 12 wk was 40% mwhc for the LF soil and 100% mwhc for the HF soil. During 5 wk of incubation the HF soil generally accumulated more mineral-N than did the LF soil at all moisture contents. After 12 wk of incubation there was a little difference in mineral-N accumulation at 20-60% mwhc between the 2 soils, but at 80-100% mwhc accumulation was considerably higher in the HF soil. There was small nitrate accumulation in the LF soil at the lower moisture contents but only with up to 5 wk of incubation. In the HF soil there was fair accumulation of nitrate at all moisture contents.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Aeration, Agriculture, Ammonium sulfate, Crop yields, *Heating soil, Phosphates, Soils, Sulfate, *Water reuse, *Soil treatment.

The formation and stabilization of water-stable aggregates under the influence of temperature in soils treated with different amounts of water, sewage, other forms of organic matter and inorganic fertilizers were studied. At higher temperatures attained in soils, either naturally or artificially, the total percentage of water-stable aggregates increased. Treatment of soils with (NH4)2SO4 and superphosphate and subsequent drying at 103C not only increased the water-stable aggregates to the maximum extent but also transformed all of them into aggregates larger than 2 mm in diameter. The increase in the water-stable aggregates and consequent improvement of aeration of the heated soils are the main reasons for getting higher crop yields.--Copyright 1973, Biological Abstracts, Inc.

DIURNAL AND SEASONAL EFFECTS OF ENVIRONMENT ON PLANT WATER RELATIONS AND FRUIT DIAMETER OF CITRUS,
New York State Coll. of Agriculture, Ithaca. Dept. of Pomology.
D. C. Elfving, and M. R. Kaufmann.
J Am Soc Hortic Sci. Vol 97, No 5, p 566-570. 1972. Illus.
Identifiers: *Citrus, Diurnal, Moisture, Permeability, Pressure, Roots, Seasonal, Shrinkage, Soils, Temperature, Vapor, *Soil water, *Leaf water potential.

Leaf water potential of 'Valencia' orange trees was influenced by soil water availability, soil temperature (T) and vapor pressure deficit (VPD) of the atmosphere. Low soil water availability prevented full nighttime recovery from water stress. Soil T below 15C decreased root permeability for water absorption and contributed to low daytime water potentials (high water stress), but at night when transpiration was minimal, complete recovery occurred. VPD effects on leaf water potential were also most noticeable during the day. Stage II fruits exhibited a recurring diurnal size change during daylight hours. This reversible shrinkage was correlated with simultaneous changes in fruit and leaf water potential and fruit diffusion resistance. However, the irreversible nighttime growth rate could not be correlated with day or night water potentials of air T, or with night VPD. While differences between fruit and leaf water potentials occurred, no evidence permits an unequivocal statement that transpiring fruits can behave as a midday reservoir of water for leaves.--Copyright 1973, Biological Abstracts, Inc.

PROTEIN CONTENT OF BROWN RICE BY UPLAND POLYETHYLENE FILM MULCHING CULTURE, (IN JAPANESE),
H. Taira, H. Taira, and F. Furusawa.
Proc Crop Sci Soc Jap. Vol 41, No 2, p 160-165. 1972. (English summary).
Identifiers: *Mulch, Polyethylene film, *Protein, *Rice (Brown).

The upland mulching culture had a higher protein content in lowland brown rice as compared with the lowland culture. The average increasing index, (upland mulching culture/lowland culture) x 100, of the nonglutinous and glutinous types was 120.6% and 122.6%. The upland mulching culture also gave higher protein content in lowland and lowland-upland hybrid brown rice as compared with the upland culture on the same manuring condition. The average increasing index, i.e., (upland mulching culture/upland culture) x 100, is as follows: lowland brown rice: non-glutinous type 106.0% and glutinous type 107.6%; lowland-upland hybrid brown rice: non-glutinous type 106.9% and glutinous type 107.2%.--Copyright 1973, Biological Abstracts, Inc.

ECOLOGICAL INFORMATION ON THE DIFFERENCES IN THE NUMBER OF CULEX TRITAENIORHYNCHUS LARVAE AMONG PADDY FIELDS (IN JAPANESE),
Osaka Prefecture Inst. of Public Health (Japan).
H. Nakamura, M. Yoshida, S. Ito, and K. Tonomura.
Jap J Sanit Zool. Vol 22, No 3, p 176-181, 1971, Illus. English summary.
Identifiers: Culex-tritaeniorhynchus, Density, Ecological studies, Food, *Japan, Larvae, *Paddy fields, Pupa, Seasonal, *Mosquitos.

The seasonal fluctuation of the density of larvae and pupae of C. tritaeniorhynchus in paddy fields was investigated at Sijyonawate-cho (Japan), 1968-1969. The number of larvae and pupae varied seasonally at each paddy field. In some paddy fields, the number of larvae and pupae tended to be maintained at relatively high levels. In other paddy fields, the number of larvae and pupae was always smaller than the average. The number of first and second instar larvae tended to be larger in the paddy fields in which the density of larvae was always high than in the ones in which the density was low. Water samples were taken from the paddy fields to check the survival rate of the first

instar larvae in the laboratory at 30C, 16 hr illumination. Survival rate was higher in the water from the paddy fields where larvae were abundant. Higher survival rate was observed in the water taken from the paddy field at certain seasons when the number of larvae was high. However, when 0.1 g of artificial food per pot was added to the water from paddy fields in which the density of larvae was low, the survival rate increased. This suggests that the low value in the survival rate in water from some paddy fields may be attributed to the deficiency of food.--Copyright 1973, Biological Abstracts, Inc.

AQUALCULUTRE: THE FARMING AND HUSBANDRY OF FRESHWATER AND MARINE ORGANISMS,
J. E. Bardach, J. H. Ryther, and W. O. McLarney.
Wiley-Interscience, a division of John Wiley and Sons, Inc.: New York, N.Y., U.S.A.; London, England. 1972. Pr.$37.50. 868p, Illus, Map.
Identifiers: Animals, *Aquaculture, Books, Farming, *Fresh water organisms, Husbandry, *Marine organisms, Plants.

A world-wide species by species illustrated description is provided of all aquatic plants and animals that are cultivated for food and the methods by which this is accomplished. Biological and ecological considerations of the organisms, the current and projected state-of-the-art of their cultivation, and yields, diseases and other problems are discussed. General principles and economics are dealt with in the first chapter. Whereever possible, data concerning yields, economics, lists of food organisms, nutritional requirements, and other pertinent topics are presented in tabular form. A total of 43 chapters are included on the culturing of various groups of freshwater and marine organisms. An appendix, pond siting and construction, provides technical information on pond culture in general. The book ends with an index of names of animals and plants, and an index of persons, places and institutions of interest to investigators interested in aquaculture.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF SOIL MOISTURE ON THE GROWTH OF MACROPHOMINA PHASEOLI, SCLEROTIUM ROLFSII AND FAUSARIUM SOLANI IN SOIL,
Jute Agricultural Research Inst., Barrackpore (India).
T. P. Mustafee, and S. B. Chattopadhyay.
Indian J Microbiol. Vol 11, No 4, p 77-82. 1971.
Identifiers: Fusarium-Solani, Growth, Macrophomina phaseoli, Sclerotium rolfsii, *Soil moisture, *Fungi.

Experiments were conducted at soil moisture levels of 20, 40, 60 and 80% saturation. The 40% saturation level was most effective for F. solani; at 80%, steady decline occurred. For M. phaseoli, 60% was favorable; at 20%, it showed an unfavorable reaction. A steady decline in S. rolfsii population was noted at all levels of saturation, especially at 80%; the fungus could not be detected 20 days after inoculation of the soil.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF IRRIGATION DEPTH ON ROOT GROWTH OF SOME PASTURE SPECIES,
Melbourne Univ., Parkville (Australia). Dept. of Agricultural Engineering.
P. W. Cullen, A. K. Turner, and J. H. Wilson.
Plant Soil. Vol 37, No 2, p 345-352. 1972. Illus.
Identifiers: Depth, Growth, Irrigation, Lolium-Perenne, Pasture species, *Root depth, Trifolium-Repens, Trifolium-Subterraneum, *Root growth.

Within the limits of the experiment, 60 cm, the depth of rooting of 3 pasture species in a sandy loam soil was found to be directly affected by the depth to which irrigation water penetrated the soil. Some practical implications for irrigation farming are discussed. The species reacted differently to the deeper wetting treatments; white clover (Trifolium repens) produced a larger weight of roots, subterranean clover (T. subterraneum) a lesser weight, and there was no difference in the weight of roots with perennial ryegrass (Lolium perenne). However, the weight of roots relative to the total weight of the plant decreased with increase in the wetting depth in all 3 species. The effect of the growth of roots on the total growth of the plants is discussed and it is suggested that root growth is not a determinate of total production when the supply of nutrients is not limiting. The vertical distribution of the roots is discussed.--Copyright 1973, Biological Abstracts, Inc.

GERMINATION OF WHEAT AS AFFECTED BY SOIL WATER STRESS,
Manitoba Univ., Winnipeg. Dept. of Soil Science.
M. C. Pawloski, and C. F. Shaykewich.
Can J Plant Sci. Vol 52, No 4, p 619-623. 1972. Illus.
Identifiers: *Hydraulic conductivity, Membranes, *Soil-water stress, *Wheat germination.

Germination rate of wheat was determined at several water potentials (-0.8, -5.3, -7.8, and -15.3 bars) on 2 soils and a semi-permeable membrane. Germination rate decreased as matric potential decreased. At a given water potential, germination rates were the same for both soils but germination on the membrane system was faster than on soils. Hydraulic conductivity was different on the 2 media, indicating that the hydraulic conductivity is an important component of soil water stress. Germination rate was not affected by decreasing water potential to -7.8 bars on each medium. At the -15.3-bar potential germination rate was considerably slower.--Copyright 1973, Biological Abstracts, Inc.
W73-12884

EFFECT OF ENVIRONMENTAL FACTORS ON WATER UTILIZATION AND BORON ACCUMULATION AND TRANSLOCATION IN SUGARCANE,
Hawaii Agricultural Experiment Station, Honolulu.
J. E. Bowen.
Plant Cell Physiol, Vol 13, No 4, p 703-714, 1972.
Identifiers: *Boron, Environmental effects, Humidity, Light *Sugarcane, Temperature, Translocation, Transpirant, Water utilization, Crop yield.

Rates of Boron (B) accumulation and/or water utilization of 3 mo.-old sugarcane plants were altered by changes in temperature, relative humidity, light intensity and duration of exposure to light. The effects of the environment on B accumulation were not directly dependent upon effects on water utilization. B accumulation was affected more than water uptake by increasing root and air temperatures from 8 deg C-37 deg C, and by raising the pH of the external solution from 5.7-7.0. Contrarily, water utilization decreased more than B accumulation when the relative humidity was increased from 30 plus or minus 5% - 95 plus or minus 5%, when light intensity was decreased or daily exposure to light was shortened and when the plants were pretreated with 5 x 10 0.00001 M phenylmercuric acetate, an anti-transpirant. The absorption of B by roots was experimentally separated from its subsequent translocation to the shoots. Absorption of B by roots was at least partially under metabolic control, since uptake from a 2 mg/l B solution could occur against a concentration gradient. Translocation of B from the roots to the shoot occurred passively in the transpiration stream.--Copyright 1973, Biological Abstracts, Inc.
W73-12966

INFLUENCE OF CERTAIN ROTATIONS UPON COTTON PRODUCTION IN THE SAN JOAQUIN VALLEY,
Agricultural Research Service, Shafter, Calif. Cotton Research Station.
J. H. Turner, E. G. Smith, R. H. Garber, W. A. Williams, and H. Yamada.
Agron J. Vol 64, No 4, p 543-546. 1972.
Identifiers: *Crop production, Alfalfa, Corn, *Cotton, Gossypium hirsutum D, Infiltration, Medicago sativa D, *Rotations, *San Joaquin Valley, Verticillium, Wilt, Zea mays M, Fertilization.

Cotton (Gossypium hirsutum L.) is the major cash commodity from San Joaquin Valley farms. Frequently, growers plant cotton for 3-6 yr without rotation. Alfalfa for hay production or grain crops planted on land removed from cotton. Very few rotation studies with cotton have been conducted in the western states. The purpose of this experiment was to determine the effect of certain rotations and N applications on growth and yield of cotton. Increased yields were obtained for cotton following alfalfa (Medicago sativa L.) and cotton following corn (Zea mays L.) over the continuous cotton plots. No advantage for yield was shown between cotton following corn and cotton following alfalfa. N fertilization increased yields of continuous cotton, of cotton following corn, and of cotton the second yr following alfalfa, but not of cotton the first yr after alfalfa. Water infiltration data showed that a significant reduction of water intake occurred on the N subplots compared to those with no N. Plant heights were significantly different at first-bloom stage for both the rotation and the N treatments. Final plant height at maturity, however, was seldom influenced by rotation treatment. The N treatment producted taller plants in most years. Verticillium wilt was more prevalent in the continuous cotton than in the cotton following other crops. Wilt was also more prevalent on the N-fertilized subplots. Growing continuous cotton lowered the yields, hindered early season growth, and increased Verticillium wilt. N fertilization reduced infiltration rate of water, which is an important consideration to farm managers in this area.--Copyright 1972, Biological Abstracts, Inc.

EFFECTS OF WATER STRESS ON NITROGEN--FIXING ROOT NODULES: IV. EFFECTS ON WHOLE PLANTS OF VICIA FABA AND GLYCINE MAX,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
J. L. Sprent.
New Phytol. Vol 71, No 4, p 603-611. 1972. Illus.
Identifiers: Glycine-max, *Nitrogen, Photosynthesis, *Root nodules, Soil, *Soybeans, Tritiated water, Vicia-faba.

Water stress reduced N fixation of soybean plants grown in the pots of sand. Provided that the nodules retained some activity, recovery on watering was normally complete in an hour. Using tritiated water (3HOH) it was confirmed that water could be withdrawn by nodules en route from the root to the shoot system. A field trial with V. faba showed a high degree of correlation between soil-water content and N-fixing activity. Slow natural drying over a 6-wk period resulted in progressive reduction of activity, which was restored by irrigation. Maximum N fixation occurred at about field capacity; above this, activity was reduced due to waterlogging. Under the conditions of the experiment, water supply was the major environmental factor affecting N fixation. It is suggested that water stress affects nodule activity directly, but that this effect may be aggravated by reduced supplies of photosynthate from wilted leaves. EVALUATION OF TENSIOMETERS FOR ESTIMATING PLANT WATER STRESS IN CITRUS,
New York State Coll. of Agriculture, Ithaca. Dept. of Pomology.
M. R. Kaufmann, and D. C. Elfving.
Hortscience. Vol 7, No 5, p 513-514. 1972. Illus.
Identifiers: *Citrus, Diffusion, Leaf, Matric, Soils, Temperature, *Tensiometers, Water stress, *Leaf-water potential.

Field measurements of leaf water potential were made on 'Valencia' orange trees subjected to varying degrees of soil water availability. During the night, leaf water potentials were reasonably well correlated with tensiometer estimates of soil matric potential. During the day, however, leaf water potentials were unrelated to matric potential because plant water balance was influenced by other factors in the shoot and root environments, including vapor pressure deficit, leaf diffusion resistance, and soil temperature.--Copyright 1973, Biological Abstracts, Inc.

CHARACTERIZATION OF EXUDATION FROM EXCISED ROOTS OF ONION, ALLIUM CEPA: I. WATER FLUX,
Liverpool Univ. (England). Dept. of Botany.
R. K. M. Hay, and W. P. Anderson.
J Exp Bot. Vol 23, No 76, p 577-584. 1972. Illus.
Identifiers: Allium-Cepa, *Exudation, Flux, *Onion roots, Hydraulic conductivity.

Measurements of the rates of fluid exudation from excised roots of onion, and determinations of the osmolalities of the exudate fluids are found to be adequately related by the simplest model in which the rate of fluid exudation is proportional to the osmotic pressure difference between the exudate fluid and the bathing solution. The mean hydraulic conductivity of roots produced by unsprouted onion bulbs is 0.44 x 0.000001 cm s-1 atm-1 and of roots from sprouted bulbs is 0.91 x 0.000001 cm s-1 atm-1.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *USSR, Valday Field Laboratory, Don River, Nomograms.

Spring floods in forest-steppe and forested regions of European Russia were analyzed for improvement of current methods for forecasting and computing components of a flood hydrograph and snowmelt losses to water absorption and evaporation in a river basin. Factors producing the outstanding spring flood of 1970 on rivers in the Central Black Earth region are examined, and studies are made of soil moisture storage in the Don River basin, water properties of frozen soils, water equivalent of snow, spring-runoff losses to basin recharge, and problems related to evaluation and analysis of items in the water balance. Data used in preparation of this collection of 14 papers are based on laboratory and on-site investigations by the Leningrad State Hydrologic Institute and on observation data of a network of stations ofthe Hydrometeorological Service. THE MULTIPURPOSE DEVELOPMENT OF THE RIVER RHONE VALLEY,
Compagnie Nationale du Rhone, Lyon (France).
C. Gemaehling, and P. Savey.
Water Power, Vol 24, No 11, p 403-410, Nov 1972. 4 fig, 7 photo, 2 tab.

Descriptors: *River basin development, Water resources development, Economic impact, *Multiple purpose projects, Watershed management, Automatic control, Hydroelectric power, Bulb turbines, Navigable rivers, Navigation, Land development, Foreign projects, Planning, Management.
Identifiers: France, Rhone River (France), Hydroelectric resources, Locks (Waterways).

The Rhone River Valley is being developed by the Compagnie Nationale du Rhone (CNR) for navigation, hydroelectric power, and agricultural water. The development plan consists of a series of low-head stations spaced about 15 to 30 km apart. Each of the 21 stations planned consists of a dam, reservoir, branch canal, power station, and navigation locks. Presently, the project power stations contribute over 8% of the total electric power production in France. Vertical shaft Kaplan turbine units were used in the early plants, but increased economy has brought changes to bulb-type equipment and also to computerized automation of all the plants. By 1975, navigation locks should make navigation possible from the Mediterranean Sea to 250 km inland. For each development, the CNR cooperates with the Ministry of Agriculture to completely reorganize local agriculture. This complex development project tends to modernize and industrialize the area surrounding the Lyons-Marseilles axis. (USBR)

Descriptors: *Reservoir yield, *Reservoir storage, *Reservoir design, Forecasting, Stochastic processes, Low flow, Streamflow, Storage capacity, Hydrology, Probability, Mathematical models, Bibliographies, *Australia.
Identifiers: Foreign studies, Stochastic data simulation, *Reservoir capacity, Reservoirs, Mathematical analysis, Streamflow records.

Methods of determining reservoir storage capacity are critically reviewed and applied to 6 Australian rivers. The storage procedures are divided into critical period, stochastic, and data generation techniques. Procedures in critical period techniques are applicable only for preliminary design. Conclusions regarding this technique are: (1) Of the lowflow techniqes, Alexander's procedure is recommended. Equally acceptable are the monthly and annual behavioral techniques. (2) Discrepancies arise in the techniques of Stall and Thompson. (3) Hardison's technique tends to overestimate the required storage. The procedures of stochastic and data generation techniques are regarded as final design techniques. Conclusions regarding these techniques are: (1) the modified procedures of Gould were the most satisfactory, and (2) both of Moran's techniques neglect the time dependence of inflows. Results from 2 synthetic data generating models illustrate that a suitable model must satisfactorily preserve the characteristics of correlated seasonal flows that are highly skewed. Although the skewed seasonal model of Thomas and Burden gave adequate results for the Yarra River, the model was not applied to more highly skewed flows. Kartvelishvli's approach may be more satisfactory for highly skewed data. (USBR)

SELECTIVE WITHDRAWAL FROM MAN-MADE LAKES, HYDRAULIC LABORATORY IVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. P. Bohan, and J. L. Grace, Jr.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-73-4, March 1973. 28 p, 25 pl.

Descriptors: *Lakes, *Hydraulic models, *Reservoirs, *Stratified flow.
Identifiers: *Selective withdrawal.

Laboratory investigations were conducted to determine the withdrawal-zone characteristics created in a randomly density-stratified impoundment by releasing flow through a submerged orifice, over a free and submerged weir, or through a combination of the above. Density stratification was generated in the experimental facilities by creating differentials in both temperature and salinity. Velocity profiles were obtained from movies of dye streak displacements. Through the investigations, generalized relationships for describing the vertical limits of the withdrawal zone and the vertical velocity distribution within the zone have been developed. Techniques for handling conditions in which the water surface or bottom boundary controlled the limits of the withdrawal zone and for describing the composite celovity profile resulting from withdrawal zones which overlapped have also been developed. If the velocity profile and the reservoir width with respect to depth are known, a vertical flow rate distribution can be determined. This flow rate distribution can then be applied as a weighting func-

tion to the reservoir profile of any water-quality parameter to determine its value in the reservoir release. (WES)

DISPOSAL OF DREDGE SPOIL; PROBLEM IDENTIFICATION AND ASSESSMENT AND RESEARCH PROGRAM DEVELOPMENT,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
M. B. Boyd, R. T. Saucier, J. W. Keeley, R. L. Montgomery, and R. D. Brown.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-72-8, November 1972. 121 p, 1 pl, 1 app.

Descriptors: *Dredging, *Environmental effects, *Spoil banks, *Disposal.
Identifiers: *Dredge spoil.

Report contains results of two study phases of the dredge spoil disposal study: problem identification and assessment and research program development. Result of assessment is that the nature and magnitude of effects of dredging and spoil disposal on water quality and aquatic organisms require extensive research and research is needed to make confined land disposal a viable disposal alternative. A broad-based research program is outlined and recommended to develop a wide choice of technically satisfactory, environmentally compatible, and economically feasible disposal alternatives to cover the wide variety of dredging and disposal operations and environments. In addition to research concerning effects of dredging and open water disposal on water quality and aquatic organisms, ways would be sought to facilitate and improve overall effectiveness and acceptability of land disposal. Attention would be devoted to modifying dredge plant equipment and operational procedures to reduce environmental impact, and to physical, chemical, and/or biological spoil improvement methods. New disposal concepts would be considered along with utilization of spoil for productive uses such as landfill and land enhancement. (WES)
W73-12573

REPORT ON ARKANSAS VALLEY CONDUIT FOR SOUTHEASTERN COLORADO WATER CONSERVANCY DISTRICT, FOUR CORNERS REGIONAL COMMISSION AND U.S. BUREAU OF RECLAMATION.
Black and Veatch, Kansas City, Mo.

Available from NTIS, Springfield, Va. 22151 as COM-73-10356 Price $3.00 printed copy; $1.45 microfiche. Report, 1972. 127 p, 17 fig, 19 tab, 20 ref, 2 append.

Descriptors: *Water importing, *Colorado, *Rocky Mountain region, *Water transfer, Planning, Water supply, Agriculture, Municipal water, Industrial water, Flood control, Electric power plants, Reservoirs, Recreation facilities, Costs, Pipelines, Water conveyance, Water sources, Evaluation, Water demand.
Identifiers: *Arkansas Valley (Colo).

The Fryingpan-Arkansas Project is a multiple purpose project of the U.S. Bureau of Reclamation involving transmountain diversion of waters from the western slope of the Continental Divide into the Arkansas River basin. The imported waters will provide an additional supply for agriculture, municipalities, and industry. Flood control, recreation, and power generation are other benefits of the project. Pueblo Dam and Reservoir, an element of the project, is presently under construction on the Arkansas River about five miles west of Pueblo. Completion of the dam is anticipated in late 1975. The Southeastern Colorado Water Conservancy District is the legal entity to contract with the Federal Government for purchase and subsequent resale of project waters. Only those entities within the boundaries of the district are eligible to receive project water. However, there are provisions in the State law under which the district operates to permit expansion of the district's boundaries. All feasible ways were studied to supply project waters, raw or treated, to the valley entities for potable purposes, considering both desalting and conventional water treatment methods and, based on these studies, to present the most economical overall supply method. (Woodard-USGS)

FORECASTING STORM-INDUCED BEACH CHANGES ALONG VIRGINIA'S OCEAN COAST,
Virginia Inst. of Marine Science, Gloucester Point.
W. Harrison, P. A. Bullock, and N. A. Pore.
Available from NTIS, Springfield, Va. 22151 as AD-752 141 Price $3.00 printed copy; $1.45 microfiche. Final Contract Report, December 31, 1971. 105 p, 66 fig, 14 tab, 12 ref, 5 append. Contract DACW72-69-C-0031.

Descriptors: *Beach erosion, *Geomorphology, *Sediment transport, *Littoral drift, *Storms, *Virginia, Coasts, Atlantic ocean, Waves (Water), Forecasting, Methodology, Meteorological data, Regression analysis, Sands, Tides, Winds, Currents (Water).
Identifiers: *Beach profile changes.

A method for operational prediction of storm-induced beach changes is presented. The method uses wind and storm-surge data that are predicted on a routine basis by the National Weather Service, NOAA, and it was felt that if such a procedure could be developed, it would be possible to provide estimates of beach erosion or deposition as part of routine weather forecasts whenever storms threatened. Beach profile changes were observed for 18 months at 16 transects along the Virginia ocean coast. Whenever possible profiling was done just before and after storms. Changes in beach sand volume computed from the profile data were correlated by linear multiple regression techniques with (1) analyzed U and V-wind components of the 1000-mb wind for several of the pertinent grid points on the National Meteorological Center's northern hemisphere grid, and (2) ocean stillwater levels recorded at two tide gages. The correlation studies did not yield completely reliable predictor equations. (Woodard-USGS)

EFFECTS OF STREAM CHANNELING ON WETLANDS IN A MINNESOTA WATERSHED,
New Brunswick Fish and Wildlife Branch, Fredericton.
J. S. Choate.
J Wildl Manage. Vol 36, No 3, p 940-944. 1972. Illus.
Identifiers: Channeling, *Minnesota, *Stream channeling, Watersheds, *Wetlands, Wildlife.

Over 60 miles of stream was channeled in the lower 3/4 of the Hawk Creek Watershed, west-central Minnesota. The channels permitted more rapid removal of flood waters but also encouraged construction of ditches and tiles by providing improved outlets. Wetlands valuable to waterfowl and other wildlife were drained as a result. On a percentage basis, wetland loss in the lower part of the watershed was nine times greater than in the unchanneled upper quarter.--Copyright 1973, Biological Abstracts, Inc.

PUBLIC LAND USE POLICY: NEEDS, OBJECTIVES, AND GUIDELINES,
Iowa State Univ., Ames. Dept. of Economics.
J. F. Timmons.
Journal of Soil and Water Conservation, p 195-201, September-October, 1972. 2 fig, 12 ref. OWRR A-999-IA (6).

Descriptors: *Land use, *Legislation, *Decision making, Long-term planning, Environment, Land management, Standards, Costs, Methodology, Social participation, Governmental interrelations, Land tenure.
Identifiers: *Land use policy, Policy formulation, Guidelines.

Evidence supports widespread recognition by the public, governments and the academic community of the need for developing land use policies. The subject deserves careful consideration when the initial policies are formulated. Towards this goal a general discussion of alternative concepts of land, various land uses which might constrain the selection of land tenure systems, and goals of land use policy is provided. The vast variety of land uses and the availability and choice of technologies involved necessitate the development of a policy that specifies the range of choice among alternatives, given desired social objectives. Land resource use and environmental quality must be approached in conjunction with other national goals. Effective land use policy must be based on facts and logic widely understood and accepted by the public. Guidelines for the formulation of effective policy include definition of policy objectives which are flexible, sensitive to results of continued research and evaluation, founded upon a consistent, integrated system of programs involving all levels of government and perhaps even open to change of traditional concepts. (Weaver-Wisconson)

INVESTIGATION OF MINERAL NUTRIENT CYCLING IN UPLAND PIEDMONT FOREST,
Forest Service (USDA), Research Triangle Park, N.C. Forest Science Lab.
C. Wells, D. Whigham, and H. Leith.
J Elisha Mitchell Sci Soc. Vol 88, No (2), p 66-78, 1972. Illus.
Identifiers: Forests, Hardwood, Litterfall, Loblolly, Minerals, *Nutrient cycling (Minerals), *Piedmont forests, Pines, Precipitation, Stemflow, Throughfall.

Nutrient cycling was investigated in a mixed hardwood and a natural loblolly pine stand. Measurements were made of the mineral element content of precipitation alone, throughfall, stemflow and litterfall. Total litterfall was 25% greater in the hardwood than in the pine. N and Ca in the litterfall were respectively 70 and 250% greater in the hardwood than in the pine. Hardwood litter contained about twice as much K, Mg, Mn, Cu, Na and Al as did the pine stand. More N, K, Ca and Mg was washed from the hardwood canopy trees than from the pine. A greater amount of K was contributed by throughfall than by litterfall.--Copyright 1973, Biological Abstracts, Inc.

COST CURVES FOR CROSS-DRAINAGE WORKS,
Government Coll. of Engineering, Aurangabad (India).
A. S. Tongaonkar.
Irrigation and Power, Vol 28, No 4, p 391-398, 1971. 7 fig, 2 tab.

Descriptors: *Cost analysis, *Canal construction, Conveyance structures, Graphical analysis, Construction costs, Aqueducts, Culverts.
Identifiers: *India (Maharashtra).

Either an aqueduct or culvert is required as a cross-drainage work to take a canal over a natural drainage. Because the cost of such a structure is dependent on many factors other than waterway availability, comparative cost analysis must provide decision criteria for site and structure selection. In addition, cost curves should corelate with canal and stream conditions. Cost curves for the Paithan Left Bank Canal of Jayakwadi Project Stage I (Godavari Project at Paithan, India) are constructed. In order to determine an appropriate means of corelating stream and canal conditions the relationship between barrel length of each culvert and cost of barrel was investigated and found to be linear. Total cost of culvert and barrel length generated a curve of initially steeper slope, thus indicating that structural items represent a large percentage of total cost and that total cost is directly related to total length of pipes. Total cost was linearly related to the waterway provided while the relationship between total cost and volume of the barrel traced a smooth curve. (Weaver-Wisconsin)

A SUGGESTED NEW APPROACH TO THE ANALYSIS OF DRAINAGE BASIN SHAPES,
Monash Univ., Clayton (Australia).
L. J. Hobba, and G. Robinson.
Area (Institute of British Geographers), Vol 4, No 4, p 242-251, 1972. 5 fig, 1 tab, 21 ref.

Descriptors: *Geomorphology, *Drainage patterns (Geologic), *Watersheds (Basins), *Terrain analysis, Topography, Valleys, *Australia.

Measures of the shape of drainage basins are reviewed and a new measure is suggested which takes into account all three dimensions of a basin. The shape indices which result are tested for a set of basins in Australia. The approach which is suggested involves the generalization of the three-dimensional form of the basin by the placement inside it of a framework of lines joining 'pivot' points within and on the perimeter of the individual catchment. The primary point A is located at the stream mouth. Point B is defined as the point where the main stream of the basin crosses the contour at which a $/A \pm 0.5$, where a and A are the areal measures used in the calculation of Strahler's hypsometric integral. G is a point projected vertically above B. Points C and D are fixed by the intersection of a line drawn perpendicular to AB through G and the basin perimeter. E is the point on the catchment circumference furthest distant in a straight line from A. (Knapp-USGS)

SOME EXAMPLES OF DRAINAGE COMPONENT ANALYSIS,
Malaya Univ., Kuala Lumpur (Malaysia).
R. P. C. Morgan.
Area (Institute of British Geographers), No 4, p 37-41, 1970. 2 fig, 1 tab, 6 ref.

Descriptors: *Geomorphology, *Hortons Law, *Drainage patterns (Geologic), Drainage density, Tributaries.
Identifiers: *Strahlers law, England, Malaysia.

First-order drainage components in third-order basins are analyzed in humid, vegetated conditions of southeast England and West Malaysia. That different environments result in different upper magnitudes is indicated by an analysis of comparing the components of the lower altitude slopes covered with rubber plantations with those of the steeper jungle covered terrain where local relief is greater. Second- order drainage develops more rapidly where the steeper slopes may be expected to produce greater surface runoff. Studies carried out in southeast England with environmental conditions of a local relief between 30 and 200 meters and hypsometric integrals around 30% show differences in the upper magnitudes attained by first-order components on three different rock types. On the Tunbridge Wells Sands, the frequency pattern reflects the presence of some very long first-order segments. The distribution pattern is interpreted in the light of the drying up of the valley heads following a fall in the water table. (Knapp-USGS)

A NOTE ON STREAM ORDERING,
University Coll. of Wales, Aberystwyth.
J. Lewin.
Area (Institute of British Geographers), No 2, p 32-35, 1970. 1 fig, 1 tab, 16 ref.

Descriptors: *Geomorphology, *Hortons law, *Drainage patterns (Geologic), Drainage density, Tributaries.
Identifiers: Shreves law.

The number of stream ordering procedures now available is such that it is more than ever necessary to decide on the best to use. Apart from the intrinsic elegance of the various quantitative relationships revealed, a practical criterion against which they may be judged is the degree to which order is proportional to stream status as manifested in size of catchment, number and lengths of contributing streams, stream discharge, or channel dimensions. An ordering system ought to relate to stream status unaffected by the way in which streams or links are combined together. Shreve's proposal to use simply the number of first-order links as an index of magnitude is most useful in this respect. To assess topological structure as well as magnitude, Shreve's magnitude system can be varied. (Streams above which are two links become second order, above which there are four links are third order, and so on.) The system is thus logarithmic. If the number of links or segments per order is then plotted on log graphpaper, A- and B-type networks appear contrasted. (Knapp-USGS)

CLIMATIC CHANGE AND ARRESTED MEANDER DEVELOPMENT ON THE RIVER SEVERN,
Wisconsin Univ., Madison.
G. H. Dury, C. A. Sinker, and D. J. Pannett.
Area (Institute of British Geographers), Vol 4, No 2, p 81-85, 1972. 1 fig, 17 ref.

Descriptors: *Geomorphology, *Valleys, *Meanders, *Topography, Glaciation, Pleistocene epoch, Terraces (Geologic), Drainage patterns (Geologic), Channel morphology, Paleoclimatology.
Identifiers: *Severn River (England).

The drainage of the upper Severn, England, has been strongly affected by a major climatic change. Some of its landforms are harmonious, others disharmonious with the climate of today. Stream shrinkage and channel filling occurred during the span 9000-8000 BP. A span of only 5,000 years included deglaciation, development of valley meanders, ingrowth of these meanders, and diminution of the streams to underfitness. The climatic events of this very brief interval impressed patterns that still survive in disharmony with the present climate. The geomorphic changes between large former and small present day meander traces and channel cross-sections, and between the associated spacing of pools and riffles exemplify step functions. Passage from step to step exemplifies the substitution of one quasi-equilibrium state for another. The contrast between the adjustment of channel cross-section and the adjustment of the long profile of the channel bed, as well as the lack of development of new stream meanders shows that some of the elements of channel morphology are out of phase with climatic changes. A PROPOSED STREAMFLOW DATA PROGRAM FOR CONNECTICUT,
Geological Survey, Hartford, Conn.
M. P. Thomas, and M. A. Cervione Jr.
Connecticut Water Resources Bulletin No 23, 1970. 18 p, 2 fig, 8 tab, 5 ref, append.

Descriptors: *Streamflow, *Project planning, *Connecticut, *Flow characteristics, Data collections, Programs, Water utilization, Water supply, Natural flow, Rivers, Streams, Regulated flow, Streamflow forecasting, Regression analysis, Hydrology, Hydrologic data, Gaging stations.

An evaluation of the streamflow data available in Connecticut was made to provide guidelines for planning future programs. Goals for a streamflow data program are identified with four classifications of streamflow data: (1) data for current use, (2) data for planning and design, (3) data to define long-term trends, and (4) data on stream environment. For principal streams draining more than 500 square miles, accuracy goals proposed for this classification of streamflow data are accuracy equivalent to that of a 25-year record, and for minor streams draining less than 500 square miles, accuracy equivalent to that of a 10-year record. The study shows that for all unregulated streams, goals relating streamflow characteristics to drainage basin characteristics. Long-term characteristics of flow in regulated streams will be determined by methods yet to be developed. (Woodard-USGS)

STAGE-DISCHARGE RELATIONS ON BIG LOST RIVER WITHIN NATIONAL REACTOR TESTING STATION, IDAHO,
Geological Survey, Idaho Falls, Idaho. Water Resources Div.
R. D. Lamke.
Open-file report IDO-22050, March 1969. 29 p, 30 fig, 7 ref.

Descriptors: *Stage-discharge relations, *Streamflow, *River forecasting, *Idaho, Theoretical anal-

ysis, Methodology, Rainfall-runoff relationships, Floods, Flood forecasting, Mathematical studies, Rating curves.
Identifiers: National Reactor Testing Station (Idaho).

Theoretical stage-discharge relations were computed for 11 selected sites on the Big Lost River system in Idaho within the National Reactor Testing Station. Rating curves were computed by various techniques, which are dependent upon the hydraulic characteristics of each site. Relative accuracies of the rating curves are shown by correlating curves of higher accuracy with curves of lower accuracy. The rating curves apply only for the stated conditions and for the physical and hydraulic characteristics existing in April 1968. After a large flood the curves could be considerably different because of erosion of the channels, dikes, and road embankments. Also, the curves for the culverts are for conditions of no debris at the entrances and in the barrels. Datum used is mean sea level. (Woodard-USGS)

CENCHRUS CILIARIS--A PERENNIAL PASTURE GRASS OF ARID AND SEMI-ARID AREAS,
Haryana Agricultural Univ., Hissar (India).
A. S. Faroda, and P. S. Tomer.
Indian Forester, Vol 97, No 12, p 675-680, December 1971. 50 ref.

Descriptors: *Forage grasses, *Pastures, *Forage palatability, *Drought resistance, *Soil conservation, Ranges, Arid climates, Semiarid climates, Plant growth, Soil-water-plant relationships, Planting management, Seeds, Application methods.

Cenchrus ciliaris is one of the dominant perennial grasses producing good quality forage in pastures and rangelands of arid and semiarid tracts. Its palatability tests have indicated that from preflowering stage till dead ripestage, it is comparable to other palatable grasses. It is widely adaptable grass native to tropical and South Africa, India and Indonesia, but now grown in Rhodesia, Uganda, Kenya, Somaliland, India, Tanganyika, Sudan, South Africa, Libya, U.A.R., Australia, and Pakistan. It provides excellent protection against soil erosion and checks the widening and deeping of gullies because of its soil binding capacity. Because of its adaptability to a wide range of soil and climatic conditions, it has a high degree of drought resistance, and extreme arid and humid conditions do not deter its growth. The most effective time for sowing this grass in arid and semiarid tracts is after the first effective rainfall. The seed rate varies with soil, rainfall and climatic conditions, with 2.25 kg seed per hectare sufficient for arid areas. Information is also given on spacing, mixtures, varieties, interculture, iver. (Gloyd-Arizona)

HIGH-ALTITUDE FORESTS AND GRASSLANDS OF MT. ALBERT EDWARD, NEW GUINEA,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research.
K. Paijmans, and E. Loffler.
J Trop Geogr. 34, p 58-64, 1972, Illus.
Identifiers: Ferns, Fire, *Forests (High altitude), *Grasslands, *New Guinea (Mt. Albert Edward), Swamps, Topography, Trees.

The pattern emerging from the study of the Mt. Albert Edward area probably applies to most high mountains in New Guinea. A broad correlation is demonstrated between vegetation and topography and drainage, while superimposed on this is a haphazard burn pattern caused by irregular and patchy fires. The mountainsides and 70% of the summit plateau were formerly forested. Natural swamp grassland areas in the formerly glaciated section serve as fire nuclei within the forest. Tree fern savannas are a disclimax caused by fire in previously forested terrain. The study area and similar areas in New Guinea are gradually being impoverished by intensive burning and hunting, and there is an urgent need for conservation.--Copyright 1973, Biological Abstracts, Inc.

ESTIMATING SNOW-WATER EQUIVALENT FROM POINT-DENSITY MEASUREMENTS OF FOREST STANDS,
Canadian Forest Service, Edmonton (Alberta).
D. L. Golding, and R. L. Harlan.
Ecology. Vol 53, No 4, p 724-725, 1972, Illus.
Identifiers: Abies-lasiocarpa, Density, *Firs, *Forests, Measurements, Picea-engelmanii, Regression, Seasonality, *Snow, *Spruce fir, Trees.

To define the cumulative influence of adjacent trees on snow accumulation, the Bitterlich point-sampling technique was used with 4 angle sizes in an area of relatively homogeneous spruce-fir (Picea engelmanii-Abies lasiocarpa) with similar slope-aspect conditions. Snow-water equivalent at 50 points for 10 measurement dates was correlated with point density. Correlations were higher for that point density determined with angle 147.34 min than for the angles 73.66, 104.18, and 208.38 min. A linear regression model combining weighted point-density measurements using three angle sizes gave the highest correlations. There was a trend of increasing correlation from Jan. to April.--Copyright 1973, Biological Abstracts, Inc.

CONSIDERATIONS FOR EFFECTIVE SLOPING LAND DRAINAGE SYSTEMS,
Agricultural Research Service, Burlington, Vt. Soil and Water Conservation Research Div.
G. R. Benoit, and J. Bornstein.
Soil Sci Soc Am Proc. Vol 36, No 5, p 819-823. 1972. Illus.
Identifiers: Bypass, Climate, *Drainage systems, Equation, Flow, *Land drainage (Sloping), Seismograph analysis, Soils, Transpiration, Evapotranspiration, *Vermont, Water balance.

A 12-plot sloping land drainage study in East Franklin, Vermont, is located on a model Cabot silt loam-a poorly-drained glacial till fragipan soil. The plots consist of all combinations of 2 depths (30 and 51 cm) and 2 spacings (61 and 122 m) of surface drains (diversions) and 3 spacings (none, 30.5, and 61 m) of subsurface drains located 102 cm deep. Drainage, soil water, and climatic data were used to evaluate a water balance equation for each drain for 6 selected drainage intervals. A seismographic analysis showed vibrations in soil depth as related to bedrock configuration. The results showed great variation in drain performance between drains in the same interval and between intervals for the same drain. Wide differences observed between values for drainage plus soil water storage and rainfall minus potential evapotranspiration seemed to be related to initial soil water content, the gain or loss of soil water, and the magnitude of potential evapotranspiration. Greatest drainflow occurred from those subdrains located at points of shallowest soil depths with bypass flow occurring under the drains particularly during saturated conditions. A drainage system for wet sloping soil should include: surface drains for controlled removal of snowmelt surface runoff; subsurface drains located at the top of bedrock dropoffs, where the bedrock is closest to the soil surface; subsurface drains systematically spaced between these drains to intercept bypass flow before it reaches downslope soil surface areas.--Copyright 1973, Biological Abstracts, Inc.
W73-12933

PRELIMINARY FLOOD-FREQUENCY RELATIONS FOR SMALL STREAMS IN GEORGIA,
Geological Survey, Atlanta, Ga.
H. G. Golden.
Open-file report, April 1973. 29 p, 8 fig, 5 tab, 15 ref.

Descriptors: *Flood forecasting, *Flood frequency, *Flood peak, *Small watersheds, *Georgia, Hydrologic data, Regression analysis, Peak discharge, Streams, Streamflow, Mathematical studies, Equations, Climatic data, Topography, Geomorphology, Drainage area, Gaging stations, Flood control, Planning, Flood plains.

New flood information from 102 small basins (0.1 to 20 sq mi), not available for previous flood-frequency analyses, and data available from 120 larger drainage basins (20 to 1,000 sq mi) have been analyzed to provide planners and designers with preliminary relations for estimating the magnitude and frequency of flood peak discharges on small streams in Georgia. A program to collect and analyze flood peak data from small natural drainage basins was begun in 1963 by the U.S. Geological Survey in cooperation with the Department of Transportation of Georgia and the U.S. Department of Transportation. The Q2 (2-year flood) peak discharges were determined from flood-frequency curves for each of the small-stream stations. Multiple regression was used to define the relation between Q2 station data and selected physical and climatological basin characteristics. Statistically significant characteristics were drainage area, soils-infiltration-capacity index, and precipitation intensity. Equations were developed for three regions in the State, roughly delineated by three physiographic provinces. Equations for estimating Q50 (50-year flood) discharge were developed from the Q2 equations by the ratio method using the station flood-frequency data computed for the large stations. The equations are considered usable for any site in Georgia where the drainage area is between 0.1 and 20 sq mi and where the flood flow is virtually natural. The approximate standard error of estimate of the Q50 equation is 41% in Region I (Valley and Ridge and Blue Ridge Province), 48% in Region 2 (Piedmont Province), and 37% in Region 3 (Coastal Plain Province.) (Woodard-USGS)

4B. Groundwater Management

ANALYSIS OF SEEPAGE INTO GROUND--WATER SYSTEM,
Ife Univ. (Nigeria). Dept. of Agricultural Engineering.
A. A. Abiodun.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY7, p 1203-1208, July 1973. 8 fig, 7 ref, append.

Descriptors: *Seepage, *Recharge, *Groundwater movement, Infiltration, Canal seepage, Artificial recharge.

Analytical methods were developed to simulate seepage into a groundwater system from a range of geometries. The solutions to such problems might find practical application in situations where subsurface lateral distribution of seepage flows is to be restricted and also in cases where porous medium that is to be replenished is overlain by a fairly thin impermeable layer. The particular case chosen is that of seepage through a channel with impervious side walls and permeable bottom. The driving force of the flow system is the force of gravity and the flow is two-dimensional. The seepage flows are steady and fully saturated, taking place in an isotropic, homogeneous, porous medium, and Darcy's Law is applicable. The solution to this problem was obtained through the application of the hodograph technique. (Knapp-USGS)

SELECTED DATA ON WELLS IN THE BARSTOW AREA, MOJAVE RIVER BASIN, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
J. L. Hughes, and D. L. Patridge.
Open-file report, March 26, 1973. 102 p, 10 fig, 4 tab.

Descriptors: *Well data, *Water wells, *Aquifer characteristics, *Water quality, *California, Basic data collections, Hydrologic data, Water levels, Chemical analysis, Water analysis, Water utilization, Water level fluctuations.
Identifiers: *Barstow area (Calif).

In June 1971 the U.S. Geological Survey, in cooperation with the U.S. Marine Corps and the California Regional Water Quality Control Board, Lahontan Region, began an investigation of the degradation of groundwater in the Barstow area, Mojave River basin, California. The study area is in parts of the lower and middle Mojave River basin, San Bernardino County, an area of about 200 square miles. The principal towns are Barstow, Lenwood, and Daggett, with major Marine Corps Supply Centers at Nebo, Yermo, and Daggett. Industry includes the Marine Corps supply activities and the Atchison, Topeka, and Santa Fe Railway, with regional maintenance facilities in Barstow. This compilation makes available selected well records, water level measurements, and water quality data which will be useful in future water resources planning, and which will provide part of the basic data for a study of water quality degradation in the area. Wells are listed in numerical order by township, range, and section according to the well-numbering system used in California. For the most part, well data were obtained from records maintained by the Geological Survey and from visits by Geological Survey personnel to the wells and to well owners. (Woodard-USGS)

PHYSICAL CHARACTERISTICS OF BASALT AQUIFERS,
Washington State Water Research Center, Pullman.
J. W. Crosby, III, and J. C. Mellott.
Available from the National Technical Information Service as PB-222 284, $2.75 in paper copy, $1.45 in microfiche. Completion, Report June 1973. 5 p, 10 ref. OWRR A-021-WASH (2).

Descriptors: *Groundwater movement, *Basalts, Hydrogeology, Geophysics, *Electrical well logging, *Borehole geophysics, Aquifer characteristics, Logging (Recording).

Determination of certain physical characteristics of basalts which influence the transmission and storage of ground waters was accomplished, using borehole geophysical techniques and composite log interpretation practices. This research led to a number of larger research projects directed to geophysical studies of the basalts. By using digitized data from the geophysical logs an averaging technique was developed which permits the assigning of an effective permeability value to 20-foot vertical sections of the basalt. These effective permeabilities are used in computer models which evaluate the areal distribution of hydraulic potential in successive 20-foot vertical 'slices' through the basalt. Attempts to determine potential values on a hybrid computer through anology with Ohm's Law were not totally successful because of the limited storage capabilities, and ultimately the analysis was completed on the IBM-360 computer.

PUBLIC SUPPORT OF PRIVATE WATER RESOURCE DEVELOPMENT IN AGRICULTURE--WITH IMPLICATIONS FOR FIRM GROWTH,
Wyoming Agricultural Experiment Station, Laramie.
E. Olson, T. L. Dobbs, G. H. Pfeiffer, and G. Wedemeyer.
In: Annual meeting of Western Agricultural Economics Association, Commercial Agriculture--Management session, July 24, 1972, Logan Utah. 8 p, 3 tab, 5 ref. OWRR A-001-WYO (57) OWRR A-002-WYO (3).

Descriptors: *Water supply development, *Agriculture, *Financing, *Return (Monetary), Loans, *Wyoming, State governments, Interest, Investment, Appreciation, Sprinkler irrigation, Groundwater resources.
Identifiers: *Public financing, *Net return, Forage crops, Cash crops.

The State of Wyoming has been involved with support of private farm operators in adopting new technology for irrigation of agricultural lands through low-interest loans for center-pivot sprinkler systems. Most of these systems have facilitated the development of new underground water supplies. The results of the analysis concerning alternative methods of irrigation system financing, and the effects of State financed irrigation investments on the growth of farm firms are discussed. Data were collected from published research, secondary sources, and interviews. It was concluded that the State's support program was only partially successful in achieving its anticipated purposes. However, State financing, as compared to alternative means of financing, provided distinct advantages to investors. Thus, utilization of groundwater supplies by agriculture has proceeded at a more rapid rate than it otherwise would have. Except at the margin, it was found that investment in sprinklers for cash crop operations would have occurred in the absence of the State program; sprinkler investments result in net return and firm growth effects of considerable magnitude in production of cash crops such as sugarbeets and potatoes. Results for livestock operation were mixed. (Weaver-Wisconsin)

EVALUATION OF THE WATER RESOURCES OF LEMMON VALLEY, WASHOE COUNTY, NEVADA, WITH EMPHASIS ON EFFECTS OF GROUND-WATER DEVELOPMENT TO 1971,
Geological Survey, Reno, Nev.
J. R. Harrill.
Nevada Department of Conservation and Natural Resources Water Resources Bulletin No 42, 1973. 130 p, 13 fig, 27 tab, 21 ref, 2 append.

Descriptors: *Groundwater resources, *Water resources development, *Aquifer characteristics, *Water wells, *Nevada, Water supply, Pumping, Water yield, Groundwater recharge, Water utilization, Imported water, Water quality, Chemical analysis, Well data, Surface waters, Evaporation, Hydrology.
Identifiers: *Lemmon Valley (Nev).

This study, made in cooperation with Washoe County, City of Reno, and Nevada Department of Conservation and Natural Resources, reappraises the water resources of Lemmon Valley, a small valley of about 93 square miles north of Reno, Nevada. Intense faulting and fracturing associated with the Walker Lane fault zone have formed barriers to groundwater movement in the valley-fill reservoir and have created permeable zones in consolidated rocks which not only store water but also probably transmit some water out of the valley. Under natural conditions, recharge and discharge average about 1,400 acre-feet per year--about 900 in Silver Lake subarea and 500 in East Lemmon subarea. During 1971 about 900 acre-feet of imported water was used by about 2,700 persons living at Stead Facility (formerly Stead Air Force Base), including industrial use. As of September 1971, the State Engineer had issued permits to pump about 15,000 acre-feet per year in Lemmon Valley. If pumping is not strategically distributed with respect to the supply, local overdraft may develop even though no valley-wide overdraft exists. In 1971 the chemical quality of groundwater was acceptable for most uses. Exceptions to this are accumulations of naturally salty water beneath the playas in both subareas and some wells affected by local conditions. (Woodard-USGS)

HYDROGEOLOGY OF THE CARBONATE ROCKS, FREDERICK AND HAGERSTOWN VALLEYS, MARYLAND,
Geological Survey, Washington, D.C.
L. J. Nutter.
Maryland Geological Survey Report of Investigations No 19, 1973. 70 p, 26 fig, 2 plate, 8 tab, 51 ref, append.

Descriptors: *Groundwater resources, *Water wells, *Water supply, *Water quality, *Maryland, Aquifer characteristics, Hydrogeology, Well data, Water yield, Water level fluctuations, Pumping, Specific capacity, Water utilization, Groundwater recharge, Geochemistry, Chemical analysis.
Identifiers: *Frederick and Hagerstown Valleys (Md).

The Frederick and Hagerstown Valleys in western Maryland are underlain predominantly by Cambrian and Ordovician limestones and dolomites and contain many karst features (sinkholes, large springs, subsurface drainage, and closed depressions) characteristic of carbonate-rock terranes. Analysis of the water budget of a principal basin in Hagerstown Valley indicates that precipitation is about 35 inches, total runoff about 12 inches, and evapotranspiration about 23 inches. Hydrograph separation at three gaging stations in the Hagerstown Valley for 1967 showed that base flow (groundwater dishcarge) is about 80% of the total runoff. Topography is controlled largely by joints, faults, and bedding and is very useful for selecting well sites where high yielding wells are likely. Water wells in valleys have a median specific capacity of 1.0 gpm per ft compared with 0.09 gpm per ft for wells located on hilltops and upland areas. The hydraulic properties of carbonate rocks differ greatly from place to place. The transmissivity ranges from less than 10 to 31,000 square feet per day. The chemical quality of the groundwater is influenced by the mineralogy of the carbonate-rock aquifers. The water is hard or very hard, and the use of water softeners is fairly common. Nitrate concentration exceeded the limit recommended by the U.S. Public Health Service of 45 mg/liter in 37 of the 139 samples analyzed. (Woodard-USGS)

Geological Survey, Washington, D.C.
I. Remson, S. S. NcNeary, and J. R. Randolph.
Water Supply Paper 1536-B, p 27-39, 1961. 10 fig, 2 tab, 9 ref.

Descriptors: *Wells, *Aquifer characteristics, Analytical techniques, Equations, Hydrologic data, *Drawdown, Hydraulics.
Identifiers: Unsaturated flow, *Unconfined saturated flow, *Unsteady radial flow.

The differential equation describing unsteady radial flow to a well in an unconfined aquifer has no simple solution in terms of elementary functions because the transmissibility decreases as the aquifer is dewatered. A numerical solution and type curves are presented showing the head of water in a homogeneous aquifer as a function of radial distance from the well and time elapsed after the water level in the well is lowered to and maintained at a given level. This solution is similar to one presented by J. R. Phillip in 1955 for linear diffusion in a flow system in which diffusivity is concentration dependent. (Campbell-NWWA)

FLOW TO WELLS NEAR STREAMS IN THE PRESENCE OF DELAYED YIELD FROM STORAGE AND ANALYSIS OF PUMPING TEST DATA,
Bulgarian Academy of Sciences, Sofia. Geological Inst.
I. G. Yotov.
Ground Water, Vol 11, No 4, p 42-45, July-August 1973. 3 fig, 1 tab, 8 ref.

Descriptors: *Surface-groundwater relationships, *Water yield, *Storage coefficient, *Groundwater movement, *Drawdown, Laplaces equation, Induced infiltration, Equations, Specific yield, Hydrogeology.

Drawdown around pumping wells in aquifers near streams was calculated, including the effect of delayed yield from storage, using the image theory. Two methods are presented for determining the aquifer constants. The first method is based on the type curves for the initial moments of pumping and for later ones. The Carson-Laplace transforms of drawdown field data are required for applying the other method. A field example is used for illustration. (Knapp-USGS)

HYDRAULICS OF SHEETLIKE SOLUTION CAVITIES,
Geological Survey, Bay St. Louis, Miss. Gulf Coast Hydroscience Center.

G. K. Moore.
Ground Water, Vol 11, No 4, p 4-11, July-August 1973. 9 fig, 10 ref.

Descriptors: *Hydrogeology, *Karst hydrology, *Limestones, *Tennessee, Fractures (Geologic), Laminar flow, Groundwater movement, Hydraulics, Hydrodynamics, Aquifer testing, Darcys law, Theis equation, Aquifer characteristics.

The sheetlike solution cavities that supply water to most wells in central Tennessee are 100 to 2,500 feet wide and less than 0.2 inch high. These dimensions have a scale similar to those in Hele-Shaw models. Both logical and mathematical evidence indicate laminar groundwater flow, except close to pumping wells. The Theis nonequilibrium formula may be used to analyze aquifer-test data and to calculate significant values for transmissivity and storage. The Navier-Stokes equation and the Darcy equation for steady-state conditions may be used to estimate cavity dimensions. (Knapp-USGS)

SOURCES OF DATA FOR EVALUATION OF SELECTED GEOTHERMAL AREAS IN NORTHERN AND CENTRAL NEVADA,
Geological Survey, Menlo Park, Calif.
F. H. Olmsted, P. A. Glancy, J. R. Harrill, F. E. Rush, and A. S. Van Denburgh.
Open-file Report, April 1973. 78 p, 1 fig, 277 ref.

Descriptors: *Geothermal studies, *Nevada, *Information retrieval, *Publications, Heat flow, Geophysics, Geochemistry, Geology, Thermal water, Thermal properties, Thermal springs, Natural resources, Water temperature, Chemical analysis, Mineralogy.
Identifiers: Sources of data, Geothermal areas (Nev).

Sources of published and unpublished data are listed for areas in northern and central Nevada selected on the basis of geologic, geophysical, geochemical, and heat-flow evidence as being the most promising for the development of geothermal resources. Each geothermal area consists of one or more hydrographic areas, as defined by the office of the Nevada State Engineer and the U.S. Geological Survey (Scott and others, 1971), and contains one or more major hydrothermal discharge outlets. Not all place names in the report are shown on the map in the pocket; those not shown may be found in the references cited. The data categories are those required to define the geothermal reservoir parameters (boundaries, effective porosity, intrinsic permeability, specific storage, and chemical and mineralogical composition of rocks), fluid and temperature parameters, and sources and rates of input and output of heat and fluid. THE LAKEFRONT PLAN OF CHICAGO.
Chicago, Ill.

December 1972. 49 p, 15 fig, 3 tab.

Descriptors: *Planning, *Recreation, Landfill, *Land use, Water quality, aesthetics, Parks, Coordination, *City planning, *Illinois.
Identifiers: *Lakefront development, Development policies, Land use controls, *Chicago.

The Chicago lakefront has been a significant area for recreational and cultural activities and of natural and man-made beauty for over fifty years. Policies and planning concepts for the maintenance and further development of the lakefront areas are presented. A short history of the development of the lakefront which was largely based on landfill projects, a discussion of basic development policies for the lakefront, a graphic presentation of possible planning alternatives for future development which include significant new landfills, and a strategy for implementing the new plans and projects are included. Strategy consists of adopting lakefront policies, conducting further studies and analyses of the area, programming various public improvements, promoting citizen participation, and establishing lakefront controls and ordinances. Some of the development policies relate to improving water quality and ecological balance, preserving cultural and historical heritage, increasing recreational diversity, preventing erosion, improving access, and coordinating public and private development. Numerous colorful maps and photographs are included. (Elfers - North Carolina)

BUFFALO CREEK DAM DISASTER: WHY IT HAPPENED,
Geological Survey, Arlington, Va.
W. E. Davies.
Civil Engineering ASCE, Vol 43, No 7, p 69-72, July 1973. 1 fig, 2 photo.

Descriptors: *Waste dumps, *Dam failure, *West Virginia, *Floods, *Coal mine wastes, Disasters, Foundation failure, Dam design, Soil mechanics.
Identifiers: *Buffalo Creek (W Va).

On February 26, 1972, a large coal refuse bank serving as a dam for a settling pool failed, resulting in a flash flood on Buffalo Creek, West Virginia. 125 persons were killed and $50 million damage was done. The refuse dam was built in 1969 by the Buffalo Mining Company, a subsidiary of Pittston Corporation. The causes of failure were inadequate foundations, lack of zoning and compaction in the structure, inadequate water-level control facilities, and lack of collars and baffles on an overflow pipe allowing water to penetrate deep within the structure. Some of the underlying causes that allowed these conditions to exist were lack of clear-cut laws and regulations at Federal and State levels; failure to enforce the State registration act as it applied to the practice of engineering; lack of planning, zoning, and engineering expertise at the county level; and failure of professions that had demonstrated competency in determining stability of refuse dams to apply their knowledge. SEDIMENT RESULTING FROM CONSTRUCTION OF AN INTERSTATE HIGHWAY IN THE PIEDMONT AREA OF NORTH CAROLINA,
Geological Survey, Raleigh, N.C.
H. E. Reeder.
Open-file report, 1973. 27 p, 12 fig, 3 tab, 2 ref.

Descriptors: *Sediment transport, *Road construction, *Sediment control, *Settling basins, *North Carolina, Technology, Sediments, Particle size, Sedimentation, Erosion control, Vegetation, Methodology.

From July 1971 to August 1972 the U.S. Geological Survey, in cooperation with the North Carolina State Highway Commission, used a small settling basin in conducting a study of sediment runoff resulting from the construction of a segment of Interstate 40 in northwestern Wake County. A settling basin was constructed as part of the highway construction project directly downstream from the highway culverts. The depth of the basin varied from about 3-1/2 to 5 feet. The initial capacity of the basin at the top of the spillway was 720 cubic yards. A 4-inch drop outlet pipe was placed through the dam to provide discharge from the reservoir. Near the peak of a storm on July 31, sediment concentration of the inflow from the waste area was 7,050 mg/liter. At the same time, the concentration was 1,170 mg/liter in the lateral culvert which drains an area where grass cover was well established. The retention capacity of the settling basin was almost depleted, which allowed about 50% of the sediment entering the basin to pass on through the basin. At approximately the same time that inflow samples were collected, concentrations in the spillway and outflow pipe were 2,920 and 2,520 mg/liter, respectively. (Woodard-USGS)
W73-12713

FISHES OF THE BIG SOUTH FORK OF THE CUMBERLAND RIVER,
Tennessee Univ., Knoxville.
C. E. Comiskey, and D. A. Etnier.
J Tenn Acad Sci. Vol 47, No 4, p 140-146, 1972, Illus.
Identifiers: Etheostoma-kennicotti, Etheostoma-sagitta, Fish, Records, River, *Tennessee (Cumberland River), *Fish migration, *Railroad construction.

A recent survey of the fishes of the Big South Fork of the Cumberland River has confirmed the continued presence of 40 of the 50 spp. previously reported from the system. An additional 27 spp. are reported from the system for the first time. Evidence concerning the recent transfer of Etheostoma kennicotti (Putnam) and E. sagitta (Jordan and Swain) from the upper Cumberland River system (above Cumberland Falls) due to railroad grade construction in the vicinity of Stearns, McCreary County, Kentucky, is discussed. Additional comments concern the apparent transfer of a number of species from more westerly tributaries of the Cumberland River into several western tributaries of the Big South Fork in recent times by way of primarily underground drainage systems in Elk Springs Valley, Wayne County, Kentucky.–Copyright 1973, Biological Abstracts, Inc.

4D. Watershed Protection

SIXTEENTH ANNUAL ARIZONA WATERSHED SYMPOSIUM PROCEEDINGS.
Arizona Water Commission, Phoenix.

Symposium held at Phoenix, Arizona, Deptember 20, 1972. Arizona Water Commission Report No. 2 (1972) 43 p.

Descriptors: *Watershed management, *Wildlife habitats, *Aesthetics, Wildlife management, Landscaping, *Arizona, Southwest US.

The watershed's prime role is changing to that of a vast playground while population growth encroaches and reduces the available resource base. Watershed productivity and carrying capacity on remaining lands must be increased to meet these new pressures and demands while sustaining yields of traditional products. Research has shown that watershed management can increase productivity to meet these demands without violating environmental constraints; the papers presented are representative of this research. Topics include wildlife habitat improvement, aesthetics, and landscaping. (See W73-12404 thru W73-12408)
W73-12403

WILDLIFE HABITAT IMPROVEMENT IN RELATION TO WATERSHED MANAGEMENT IN THE SOUTHWEST,
Forest Service (USDA), Tempe, Ariz. Forest Hydrology Lab.
H. G. Reynolds.
In: 16th Annual Arizona Watershed Symposium Proceedings, September 20, 1972, Phoenix, Arizona, (1972) p 10-17. 5 fig, 50 ref.

Descriptors: *Wildlife habitats, *Wildlife management, *Watershed management, *Habitat improvement, *Competing uses, *Arizona, Cost-benefit analysis, Ponderosa pine trees, Pinyon pine trees, Juniper trees, Chaparral, Riparian land, Forest watersheds, Environmental effects.
Identifiers: Beaver Creek Pilot Watershed Project (Ariz.).

The interaction of ecological factors with social constrainst of laws and customs, together with economic limitations of costs vs. benefits, as this interaction bears on wildlife habitat at improvement in conflict with watershed management is discussed. It is desirable to understand how alteration of a vegetation complex by activities such as cutting or burning influences resident wildlife species, so that management practices can be developed compatible with multiple use of watershed. Ponderosa pine, pinyon-juniper, chaparral, and riparian habitats are discussed, with attention given to various means of modifying them to increase water yield. The effectiveness of wildlife habitat management practices depends not only upon detailed ecological knowledge, but its coordination with the needs and objectives of society as tempered by economic limitations. Nevertheless constraints are recommended to improve and enhance wildlife habitat when vegetation is being altered to improve water yield. Not only is it necessary to consider these but their employment will actually create more productive watersheds. (See also W73-12403) Paylore-Arizona)

RESPONSES OD DEER AND ELK TO BEAVER CREEK WATERSHED TREATMENTS,
Arizona Game and Fish Dept., Flagstaff.
D. J. Neff.
In: 16th Annual Arizona Watershed Symposium Proceedings, September 20, 1972, Phoenix Arizona (1972), p 18-24. 7 fig.

Descriptors: *Wildlife habitats, *Watershed management, *Habitat improvement, *Wildlife management, *Big game, Deer, Forest watersheds, Demonstration watersheds, Ponderosa Pine trees, Juniper trees, Pinyon trees, Oak trees, Clear-cutting, *Arizona.
Identifiers: Pellet group counts, Beaver Creek Pilot Watershed Project (Ariz.), Elk.

Research studies on the Beaver Creek watersheds in central Arizona to observe and evaluate responses of deer and elk to experimental vegetation treatments by pellet group counts show that in pinyon-juniper type habitat treatment plans should be conservative, keeping cleared areas relatively small and well interspersed with standing juniper cover. Productivity of tall brose plants should be protected, as well as highly palatable forbs and half-shrubs. One experimental watershed in the study lost its total forage cover by heavy experimental application of herbicides. In the ponderosa pine type habitat, logging management systems that open up small clear-cut spots or strips in pine forest canopy appear to be generally favorable to deer and elk. Gambel oak provides highly palatable browse and should be given high priority for its wildlife values. Stands of relatively rare tree and shrub species of special wildlife or esthetic value should be given consideration in logging or watershed management plans. Pine stringers that extend down along drainageways into grassland or juniper have great value as travel lanes and feeding areas for big game far out of proportion to the acreage and number of trees involved and should therefore, be given high priority for wildlife habitat. A series of figures for 16 experimental watersheds in the area show mean annual deer use by pellet groups per acre per month on clear cut windrowed, untreated, one-third clear-cut irregular strips, cabled, or felled. (See also W73-12403) (Paylore-Arizona)
W73-12405

A TREATMENT PRESCRIPTION FOR IMPROVING BIG GAME HABITAT IN PONDEROSA PINE FORESTS,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
W. P. Clary.
In: 16th Annual Arizona Watershed Symposium Proceedings, September 20, 1972, p 25-28. 1 fig, 8 ref.

Descriptors: *Wildlife habitats, *Big game, *Habitat improvement, *Watershed management, Ponderosa pine trees, *Demonstration watersheds, Projections, Forest watersheds, Water yield improvement, Small animals (Mammals), *Arizona.
Identifiers: Beaver Creek Pilot Watershed Project (Ariz.).

Using one of several experimental watersheds on the Beaver Creek watershed, central Arizona, this study will attempt to employ a number of techniques as applied to elk, deer, turkey, carnivores, small rodents, birds, and insects, to determine response to alterations in habitat. The prescription will be related to a series of treatment studies in the ponderosa pine types that include untreated controls, manipulation of timber overstory to increase water yield, livestock grazing to increase water yield, and silvicultural management to improve timber yield. Wildlife evaluations are included in most of these treatment studies. The intent of this particular one is to improve habitat for big game, but a number of constraints are imposed in the prescription to minimize the impact of these management procedures on smaller forms of wildlife. Computer models will be used to determine alternatives for management procedures designed to improve big game habitat, by insuring maintenance of maximum production and availability of wildlife feed without adverse effects on forest products and values. Results of this model will, it is expected, also provide evaluations of the hydrologic performance of the watershed, impact on sediment yields, initial and long-term effects on the timber resource, response of forage species important for both big game and livestock, and esthetic and recreational values of the treatment. (See also W73-12403) (Paylore-Arizona)
W73-12406

THE VISUAL ASPECTS OF RESOURCE MANAGEMENT,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
I. L. Fish.
In: 16th Annual Arizona Watershed Symposium Proceedings, September 20, 1972, Phoenix, Arizona (1972), p 29-37. 18 fig.

Descriptors: *Aesthetics, *Landscaping, *Scenery, *Land resources, *Watershed management, Environmental effects, Natural resources.
Identifiers: Perception.

The four dominant elements that characterize landscape: form, line, color, and texture, are applied to landscape management, which strives both for the utilitarian aspects of resource management programs as well as the potential visual opportunities of such programs, or, in a word, landscapes by intent, not accident. Temporary changes that constitute retrievable impacts on the visual landscape are differentiated from actions that cause irretrievable loss of non-renewable resources. Three concepts to recognize in dealing the landscape manipulation are its identifiable character, visually acceptable variety, and deviations that can be managed to achieve that variety. Criteria beyond the 4 dominant elements noted above include geological formations, vegetative arrangement or variety, water features (streams, lakes, waterfalls), and the existence of or lack of man's intrusions on the landscape. By following certainprinciples, the potential visual impact on the landscape of any management procedures can be portrayed and predicted in advance of activity. In watershed management programs particularly, the visual quality of the landscape can be controlled to the benefit of all. (See also W73-12403) (Paylore-Arizona)

A set of criteria is presented that might be used to judge techniques designed to quantify scenic beauty, a new approach based on a systematic conceptual model supported by some recent research results from Arizona timberlands is described, and then the advantages of this approach are discussed in the context of the criteria. Criteria are that they be conducive to public involvement, independent of the tastes and preferences of the developers of the techniques, and statistically and mathematically unbiased; theoretically sound; capable of handling adequately uncertainties of judgments; easy to use, relatively inexpensive, valid, reliable, etc. Data from 6 Arizona ponderosa pine watersheds were used, of which 5 represented a wide array of vegetative manipulations. Using the Theory of Signal Detection methodology, various groups were tested by means of randomized sequences of slides to determine if the subjects

ould consistently detect vegetative treatments. he TSD provides a means of achieving unbiased erceptual indices, is easy to use, fairly inexpen- ive, and provides more than simple ordinal infor- nation. This method of analysis ensures that out- uts are unbiased by judgmental criteria, and that ie perceived value is separated from standards. s use is recommended in environmental design. ournal of Soil and Water Conservation, Vol 27, o 6, p 264-269, Nov-Dec 1972. 4 fig, 4 tab, 12 ref.

escriptors: *Mulching, *Erosion control, *Slope abilization, Soil conservation, *Vegetation tablishment, Erosion, Construction, Slopes, ood wastes, Grasses, Bank stabilization, *Slope otection, Soil stabilization, Soil erosion, Sites, ank protection, Construction materials.
dentifiers: *Mulches, Straw, Cut slopes, Con- ruction practices, Construction methods.

n erosion study was conducted to compare everal materials for use as mulches to control soil osion on construction slopes. Crushed stone, avel, and woodchip mulches showed great otential for erosion control on steep denuded opes, especially where conventional methods ight have been unsatisfactory. The effectiveness f the mulches in stabilizing the soil surface was a nction of surface cover and mulch stability. lulches costing much less than sodding were tisfactory slope stabilizers. Types and rates ited for different conditions are summarized. or 20% slopes tested, 100 to 200 tons/acre of one or gravel or 15 to 25 tons/acre of woodchips ovided excellent soil stabilization at reasonable st on slope lengths up to about 150 ft. These sults suggest that many construction slopes can e stabilized permanently immediately after they e shaped, and at reasonable cost. (USBR)

A. Identification of Pollutants

NITROGEN CORRECTION FOR CALORIC ALUES,
msterdam Univ. (Netherlands). Lab. of Animal hysiology.
. Kersting.
imnology and Oceanography, Vol 17, No 4, p 3-644, 1972. 11 ref.

Descriptors: *Analytical techniques, *Nitrogen, *Productivity, Metabolism, Ammonia, Oxidation, Calibrations, Measurement.
Identifiers: *Calorimetry, Oxygen bomb calorimeter.

In production studies the oxygen bomb calorimeter has become an important tool. The fact that the reaction product of nitrogen compounds in the bomb differs from the biological reaction product is of concern to ecologists. In many aquatic organisms the main end product of nitrogen metabolism is ammonia; in oxygen bombs, however, the nitrogen is oxidized further. The extra energy obtained in this way has no biological meaning and a correction should be made accordingly. To compute this correction the end product of the nitrogen oxidation process in the bomb must be known. Determination of nitrates after the combustion of Daphnia magna in the Parr semimicro bomb gave results suggesting that when D. magna is bombed, the nitrogenous end product is, as would be generally expected, primarily N2. If so, a correction has to made for the reaction by which ammonia is oxidized to N2; the necessary energy can be calculated from the standard heats of formation. This correction is important, especially if caloric values of organisms with different nitrogen contents are compared. (Jones-Wisconsin)

THE EVALUATION OF EXISTING FIELD TEST KITS FOR DETERMINING FREE CHLORINE RESIDUALS IN AQUEOUS SOLUTIONS,
Army Medical Environmental Engineering Research Unit, Edgewood Arsenal, Md.
K. J. Guter, and W. J. Cooper.
Available from NTIS, Springfield, Va. 22151 as AD-752 440 - Price $3.00 printed copy; $1.45 microfiche. Report No 73-03, October 1972. 59 p, 7 fig, 23 tab, 31 ref, 5 append.

Descriptors: *Water analysis, *Chlorine, *Analytical techniques, Correlation analysis, Reviews, Evaluation, Chemical analysis, Aqueous solutions, Chlorination, Water treatment.
Identifiers: *Chlorine test kits.

An evaluation of five commercial test kit procedures which measure free available chlorine was conducted on both synthetic water (chemically treated distilled water) and five natural waters. Synthetic water samples were used to evaluate parameters influenced by temperature and pH. The ability of test kit procedures to differentiate free available chlorine from other previously reported chlorine test interfering ions, Mn and NO2, and the compounds monochloramine and dichloramine were also studied. The primary objective of the natural water studies was to evaluate the test kit procedures on a variety of natural waters that could be encountered around the world. Accuracy, precision and specificity for free available chlorine were evaluated with the natural water samples. The results led to a recommendation that procedural modifications be attempted in order to increase the specificity of the N,N-diethyl-p-phenylene diamine procedure and to improve the accuracy of the Syringaldazine (liquid) procedure, without adversely affecting their other qualities. TRITIUM MEASUREMENT OF NATURAL WATERS ON OAHU, HAWAII: A PRELIMINARY INTERPRETATION (SAMPLING PERIOD: JULY 1969 TO JUNE 1970),
Hawaii Univ., Honolulu. Water Resources Research Center.
L. S. Lau, and T. H. Hufen.
Available from the National Technical Information Service as PB-222 279, $3.00 in paper copy, $1.45 in microfiche. Technical Report No. 65, May 1973. 39 p, 11 fig, 3 tab, 15 ref, 2 append. OWRR A-021-HI (1).

Descriptors: *Tritium, *Hawaii, Precipitation (Atmospheric), Surface waters, Groundwater, Isotopes, Measurement, Data collections, Data analysis.
Identifiers: *Oahu (Hawaii).

Water samples collected from various surface and sub-surface sources on the island of Oahu were analyzed for tritium levels. Tritium activity levels in twenty-five monthly rainwater samples show a seasonal dependence with a maximum in the summer (18.5 to 23 TU) and a minimum in the winter (12 TU). Samples from two surface-water reservoirs had activities of 13.2 and 19.7 TU reflecting contemporary rainwater which is their major source of recharge. Four streams in the Pearl Harbor area showed 'rainwater' tritium levels when sampled at high flow. At low flow, two of the streams had low tritium levels indicating ground-water discharge into the stream, while the tritium activity of the other two streams was comparable to rainwater. Tritium activity higher than that of contemporary rainwater (22-38 TU) was exhibited by samples from two springs which discharge perched water, while samples from three wells and two shafts in the Honolulu area showed very little or no tritium activity. Multiple-depth samples obtained from wells in the Pearl Harbor area showed correlations between tritium activities, depths of sampling, and chloride concentrations.

USE OF COLIPHAGES AS INDICATORS OF WATER POLLUTION,
New York Univ., N.Y. Dept. of Biology.
M. C. Hilton, and G. Stotzky.
Canadian Journal of Microbiology, Vol 19, No 6, p 747-751, June 1973. 2 fig, 2 tab, 15 ref.

Descriptors: *Water pollution sources, *Sewage, *Bacteriophage, *Bioindicators, Indicators, Parasitism, Bacteria, Coliforms, Municipal wastes, Hudson River, New York, Aquatic life, Bioassay, Water analysis, Pollutants, Testing procedures, Sampling, Rivers, Running waters, Sewage bacteria, Feasibility studies, *Pollutant identification.

The feasibility of using coliphages, obligate parasites of coliform bacteria, as indicators of water pollution by sewage was investigated. No consistent relationship was found between concentrations of coliform bacteria and coliphages in

samples from the Hudson River on the lower west side of Manhattan, New York. The results indicated, however, that a modification of the enrichment method for the detection of phages in soils and sewage could be used for detecting low levels of phages active against specific host bacteria. PITFALLS AND PROCEDURES IN BOD TESTS,
MacMillan Bloedel Ltd., Vancouver (British Columbia).
W. E. Razzell.
Pulp and Paper Magazine of Canada, Vol 73, No 7, p 86-89 (p T186-189), July, 1972. 6 fig, 9 ref.

Descriptors: *Biochemical oxygen demand, *Pulp wastes, *Analytical techniques, Testing procedures, Water analysis, Waste waters (Pollution), Bioassay, Chemical analysis, Organic loading, Microorganisms, *Reviews.

A review of the literature on determinations of the BOD of diverse organic chemicals and of pulp mill wastes emphasizes the crucial importance of properly acclimated seed (i.e., mixed microbial flora) for successful short-term test results. Seed acclimation, leading to increased BOD values, avoids results which underestimate the chemical load of wastes and which could be refuted by additional tests with a more active seed. The use of BOD as a measure of waste discharges places a heavy burden on the analyst and requires an accumulation of data far beyond the routine analyses themselves. (Brown-IPC)

IRAPA, Prague (Czechoslovakia).
S. Pokorny.
Papir a Celuloza (Prague), Vol 27, No 1, p 3-4, 12, 1972. 2 tab, 18 ref.

Descriptors: *Water analysis, *Pollutant identification, Waste waters (Pollution), Industrial wastes, Reviews, Testing procedures, Analytical techniques, Effluents, Pulp and paper industry, *Biochemical oxygen demand, Chemical oxygen demand, *Pulp wastes, Oxygen demand, Foreign research, Europe, Chemical analysis, Organic compounds.
Identifiers: *Czechoslovakia.

Various methods are outlined for the analytical determination of organic compounds in aqueous industrial wastes, especially pulp and paper mill effluents. Among determinations of biochemical oxygen demand, the classical five-day and respirometric procedures are compared. In measuring chemical oxygen demand by means of potassium permanganate or dichromate, a modified method developed specifically for use in the pulp and paper industry is discussed. (Trubacek-IPC)

UPPER CHESAPEAKE BAY WATER QUALITY STUDIES, 1968-1971.
Environmental Protection Agency, Annapolis, Md. Field Office.

Data Report No 32, 1973. 31 p.

Descriptors: *Water analysis, *Water quality, *Chemical analysis, *Chesapeake Bay, Sampling, Analytical techniques, Inorganic compounds, Organic compounds, Water chemistry, Nutrients, Water temperature, Hydrogen ion concentration, Coliforms, Data collections, Sewage effluents, Pollutant identification, Water pollution sources.
Identifiers: *Upper Chesapeake Bay.

During the years 1967-71, various special surveys were conducted of the upper Chesapeake Bay and a number of its tributaries. The results of these investigations are presented. Bush River, Romney Creek, Spesutie Narrows and Swan Creek investigations have continued to determine the effects of the new Sod Run treatment plant on water quality and eutrophication. In the Chesapeake and Delaware Canal, studies were made of the effects of freshwater diversion from the Susquehanna River while work on the C and D Canal enlargement continued. Other studies were conducted on the Chester, Severn, Gunpowder, Middle, and Bird Rivers. Analytical methods and results are presented for the following parameters: water temperatures, light extinction, pH, conductivity, salinity, total phosphorus, inorganic phosphorus, total Kjeldahl nitrogen, nitrate + nitrite, ammonia, dissolved oxygen, biochemical oxygen demand, total organic carbon, total carbon, chlorophyll a, coliform, fecal coliform, and metals in solution. PROBLEMS IN THE ANALYSIS OF TRACE METALS,
Washington State Univ., Pullman. Nuclear Radiation Center.
R. H. Filby.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 59-79, January 1973. 16 tab, 18 ref.

Descriptors: *Pollutant identification, *Trace elements, *Chemical analysis, *Analytical techniques, Instrumentation, Sampling, Mass spectrometry, Polarographic analysis, Spectroscopy, Spectrophotometry, Heavy metals.

Trace element analysis is now a separate area of analytical chemistry, and many of the problems encountered are peculiar to the chemistry of very low concentrations. In the 1930's emission spectrography was used extensively for the determination of trace elements in many materials, and although the method proved to be a convenient and sensitive technique for many elements, it has been largely supplanted today by more precise and sensitive analytical methods. Some of the more important analytical methods in use today, and problems that may be encountered in determination of trace elements in environmental materials are summarized. Sample collection and chemical separation techniques are emphasized. (See also W73-12604) (Woodard-USGS)

FACTORS INFLUENCING DETECTION OF SALMONELLAE IN RENDERED ANIMAL BY--PRODUCTS,
Swift and Co., Oak Brook, Ill. Research and Development Center.
R. B. Tompkin, and T. V. Kueper.
Applied Microbiology, Vol 25, No 4, p 485-487, April 1973. 3 tab, 9 ref.

Descriptors: *Pollutant identification, Cultures, Feeds.
Identifiers: *Animal by-products, Enrichment, Culture media, Sample size.

The purpose was to develop a better understanding of the factors, such as enrichment and plating media and quantity of product tested, which influence the detection of salmonellae in naturally contaminated animal by-products. Two samples were analyzed for Salmonella, one with selenite-cystine broth and one by tetrathionate-Brilliant Green-iodine broth, both containing Tergitol No. 7. The enrichment broths were streaded onto plates of Brilliant Green-sulfa agar and Salmonella-Shigella agar. Salmonella-like structures were picked to triple sugar iron agar slants and tested serologically. The results confirm that a linear relationship exists between total plate counts and the detection of salmonellae in animal by-products in the total count range of 10,000 to 10,000,000 per gram. DEGRADATION OF METHYLMERCURY BY BACTERIA ISOLATED FROM ENVIRONMENTAL SAMPLES,
Midwest Research Inst. Kansas City, Mo.
W. J. Spangler, J. L. Spigarelli, J. M. Rose, R. S. Flippin, and H. H. Miller.
Applied Microbiology, Vol 25, No 4, p 488-493, April 1973, 1 fig, 5 tab, 7 ref.

Descriptors: *Microbial degradation, *Lake sediments, *Aquatic bacteria, *Aerobic conditions, *Anaerobic conditions, *Freshwater fish, Volatility, Radioactivity techniques, Biodegradation, Cultures, Isolation, Chemical analysis, Aquatic environment, Mercury, Heavy metals, Sampling, Methane.
Identifiers: *Methylmercury, *Demethylation, *Fate of pollutants, Biological magnification, Environmental samples, Lake St. Clair, Organomercury compounds, Electron capture gas chromatography, Flame ionization gas chromatography, Methylmercury iodide, Mercury radioisotopes, Hg-203, Methylmercury bromide.

In order to investigate the possibility that organisms capable of degrading methylmercury are present in the aquatic environment, 207 organisms which were isolated from sediments and fish were screened for demethylation of methylmercury bromide (MMB). Fish and sediment samples were also analyzed for total mercury and methylmercury. Each organisms to be tested for aerobic degradation was grown through 2 transfers in shaker flasks containing tryptic soy broth (TSB) without inorganic Hg or methylmercury. Hg-203-labeled MMB was added and each flask was connected to an HgBr sub 2-KBr trap containing a trapping solution to scavenge any inorganic Hg or organomercurials volatilized from the flask. Head gases were flushed to traps with a stream or vapor-saturated, sterile air. For anaerobic demethylation, 0 sub 2-free N sub 2 was used as the flushing gas, and 0.025 percent cysteine was added to the TSB. The trapped gas was monitored with a gamma scintillation spectrometer; methane in head gases was analyzed by flame ionization GC. Traps and flask contents were analyzed for MMB after extraction whereby methylmercury iodide was determined in benzene extracts by electron capture gas chromatography. Of the 207 bacterial cultures, 30 were found positive for aerobic demethylation. Twenty-two were shown to be facultative anaerobes and 21 degraded methylmercury anaerobically. All positive species volatilized methylmercury aerobically, and methane was produced as a degradation product. Although methylmercury degradation was complete in most cases, material balances indicated some of the inorganic mercury formed was not volatilized and is presumed bound to the cells. All positive isolates were tolerant to at least 0.5 microgram of methylmercury per ml, and the extent of volatilization of mercury increased with concentration to the threshold value. The results indicate that demethylating species are prevalent in the environment and may be important in suppressing the methylmercury content of sediments. (Holoman-Battelle)

THE ZOOPLANKTON OF THE GULF OF GUINEA,
V. Bainbridge.
Bulletins of Marine Ecology, Vol 8, No 1, p 61-97, September 1972. 13 fig, 7 tab, 72 ref.

Descriptors: *Zooplankton, *Sampling, *Atlantic Ocean, *Distribution patterns, *Migration patterns, Upwelling, Copepods, Vertical migration, Water temperature, Salinity, Diurnal distribution, Diel migration, Spatial distribution, Temporal distribution, Biorhythms, Africa.
Identifiers: *Species diversity, Sample preservation, Gulf of Guinea, Nigeria, Ghana, Cameroun, Senegal, Sierra Leone, Macroinvertebrates, Paracalanus spp., Eucalanus pileatus, Oncaea spp., Temora spp., Centropages spp., Oithona spp., Macrosetella spp., Corycaeus spp., Corycella garcillis, Acartia danae, Calocalanus spp., Undinula vulgaris, Copilia mirabilis.

The quantity and composition of the zooplankton in the coastal waters of tropical West Africa and its variability in relation to the hydrographic climate of the region are discussed. Three series of zooplankton collections were used: (a) samples taken with closing nets near the edge of the shelf off Guinea in October, 1956 and off Nigeria in 1961 and 1962 to investigate vertical distributions and migrations; (b) samples collected from July 1961 to July 1962 at the stations of a monitoring oceanographic transect off Lagos, Nigeria, to study the annual cycle of zooplankton; and (c) samples collected in 1952 during extensive fishery surveys along the West African shelf between Cape Verde and Fernando Po. All collections were preserved in 5 percent formaldehyde made up in filtered sea water and neutralized with borax. The results of the plankton analyses were considered in terms of community diversity and trophic structure. Zooplankton showed a marked discontinuity at the thermocline. Off Lagos in 1961 and 1962, quantities of zooplankton within the upper 30 m were normally low, showing a gradual transition from neritic to an oceanic fauna with increasing distance from the coast. During a weak upwelling in August and September, zooplankton volumes over the shelf increased fourfold or more. Two copepods, Calanoides carinatus and Eucalanus monachus, both relatively rare over the shelf during stable conditions, became abundant in the surface waters. During the upwelling, the faunal diversity declined and the percentage of carnivores in the population fell below the usual 20-40 percent level. Extensive surveys have confirmed the great ecological importance and frequent dominance of the copepod Calanoides carinatus during the localized upwellings off Ghana and Senegal where it would appear to be one of the main exploiters of the accompanying diatom blooms. The relevance of these studies to some well known concepts regarding speciation in tropical environments is discussed. The key factor leading to the usually highly diverse zooplankton appears to be relative stability of the environment. (Little-Battelle)

AN INTERDISCIPLINARY STUDY OF THE ESTUARINE AND COASTAL OCEANOGRAPHY OF BLOCK ISLAND SOUND AND ADJACENT NEW YORK COASTAL WATERS,
Long Island Univ., Greenvale, N.Y. Science Engineering Research Group.
E. F. Yost.
Available from the National Technical Information Service as N73-15346, $3.75 in paper copy, $1.45 in microfiche. Report Nos TR-20-1, NASA-CR-129936, December 1972. 47 p, 20 fig, 9 tab, 1 ref, append. Contract No NAS5-21792.

Descriptors: *Remote sensing, *Phytoplankton, *Water analysis, *Coasts, Water temperature, Salinity, Dissolved oxygen, Nutrients, Suspended solids, Optical properties, Chlorophyll, Silica, Pollutant identification, Phosphates, Nitrates, Nitrites, Organic matter, Aerial photography.
Identifiers: *Ground truth, Data interpretation, Chlorophyll a, Chlorophyll c, Block Island Sound, Multispectral photography.

The synoptic repetitive coverage of the multispectral imagery from the ERTS satellite, when photographically reprocessed using the state-of-the-art techniques, has given indication of spectral differences in Block Island and adjacent New England waters which were heretofore unknown. Of particular interest was the possible detection of relatively small amounts of phytoplankton prior to the occurrence of the red tide in Massachusetts waters. Preparation of spatial and temporal hydrographic charts using ERTS imagery and ground truth analysis should facilitate determining the environmental impact of New York coastal waters. Ground truths will be established by analyzing water samples for temperature, salinity, oxygen, nutrients, pigments, organics, phytoplankton, and optical properties. (Little-Battelle)

WATER QUALITY DETERMINATIONS IN THE VIRGIN ISLANDS FROM ERTS-A DATA,
Grumman Aerospace Corp., Bethpage, N.Y. Research Dept.
W. Egan.
Available from the National Technical Information Service as AD-754 009, $3.00 in paper copy, $1.45 in microfiche. Report No RM-561J, December 1972. 72 p, 13 fig, 7 tab, 9 ref.

Descriptors: *Water quality, *Remote sensing, *Aerial photography, *Aircraft, Sewage effluents, Sediments, Photometry, Virgin Islands, On-site investigations, Environmental effects, Pollutants, Thermal pollution, Water cooling, Chemical analysis, Water analysis, Ocean circulation, Optical properties, Turbidity, Dredging.
Identifiers: *Sensors, *Data interpretation, ERTS-A sensors, Multispectral sensing system.

The harbor at Charlotte Amalie on St. Thomas, Virgin Islands, has a concentration of many factors affecting water quality: untreated sewage effluent, sediment from navigation and dredging operations, runoff from a garbage dump, and hot effluent from a desalination/power plant. Imagery from ERTS-A in association with aircraft imagery and ground truthing permits the characterization of water quality in terms of absolute color values. This necessitates the establishment of photometric standards resolvable by the ERTS-A sensors in order that atmospheric effects, which generally vary on sequential overpasses, may be determined and subtracted. The overall program is described together with typical numerical results. (Holoman-Battelle)

IDENTIFICATION AND MEASUREMENT OF ENVIRONMENTAL POLLUTANTS. SYMPOSIUM.

Ottawa, Ontario, Canada, June 14-17, 1971. National Research Council: Canada. 1971. 451 p. Illus. Maps.
Identifiers: Animals, Books, Chromatography, *Environmental pollutants, *Measurement, Pollutants, Symposium, *Pollutant identification.

This symposium was concerned with securing, devising, testing and adopting uniform, precise and accurate methods of analysis and to give official sanction to those techniques and procedures found acceptable for the identification and measurement of pollutants. All the invited symposium papers as well as the plenary lectures are presented. The first group of papers discuss the following: the need for environmental monitoring; evaluation of S and Se compounds as air pollutants; permeation tubes as primary gaseous standards; soil-pesticide interactions; and pesticide metabolism in animals. The next group of papers covers the following topics: analytical and organoleptic measurement of odors from animal wastes; determination of polychlorinated biphenyls in environmental samples; the problem of contaminants in human food; some recent developments in the chromatographic determination of multicomponent pesticide residues; and remote sensing techniques for oil slick measurements. The next section contains papers on the following topics: carbon analysis in pollution abatement; identification and measurement of trace elements in freshwater by neutron activation; P compounds in natural waters; and differentiation of chemical states of toxic species, especially cyanide and Cu, in water. The final group of papers describes the following related topics: tracer cosmos, a realistic concept in pollution analysis; monitoring of radioactive isotopes in environmental materials;fluoride in the environment; and man's reaction to his acoustical environment.--Copyright 1973, Biological Abstracts, Inc.

DETERMINATION OF MELAMINE-FORMALDEHYDE RESIN IN WHITE WATERS (OPREDELENIE SODERZHANIYA MELAMINO-FORMALDEGIDNOI SMOLY V PODSETOCHNYKH VODAKH),
Vsesoyuznyi Nauchno-Issledovatelskii Institut Tsellyulozno-Bumazhnoi Promyshlennosti, Pravdinski (USSR).
G. B. Shtreis, M. V. Frolov, and Yu. G. Polikanov.
Bumazhnaya Promyshlennost, No 1, p 26, January, 1972. 1 fig, 2 tab.

Descriptors: *Water analysis, *Resins, *Pulp wastes, *Waste water (Pollution), Effluents, Testing procedures, Analytical techniques, Pollutants, Pulp and paper industry, Ultraviolet radiation, Spectrophotometry, Nitrogen compounds, Polymers, Additives, Retention, Chemical analysis.
Identifiers: *Melamine resins, Synthetic polymers, White water, Cellulose fibers, Melamine, Formaldehyde, Chemical retention, Pulp additives, Chemical consumption.

The efficiency of retention of melamine-formaldehyde resins by pulp fibers affects not only the sizing quality and wet strength of paper, but also the amounts lost in the paper machine waste water (white water) and thus the pollution load of the sewered effluent. A convenient and rapid procedure for determining resin retention is described. It is based on the absorption of ultraviolet light at 243 nm by the resin, followed by calculation of resin concentration in the white water. It gives analytical results which agree with those obtained by the more time-consuming Kjeldahl method to within plus or minus 5 per cent. (Stapinski-IPC)

WATER QUALITY IN THE MIDDLE FORK FEATHER RIVER, CALIFORNIA, MAY 1970 THROUGH SEPTEMBER 1971,
Geological Survey, Menlo Park, Calif. Water Resources Div.
A. E. Dong, and R. L. Tobin.
Open-file report, February 22, 1973. 55 p, 8 fig, 5 tab, 13 ref, 6 append.

Descriptors: *Water quality, *Wild rivers, *California, *Chemical analysis, Scenery, Rivers, Recreation, Sampling, Streamflow, Flow rates, Gaging stations, Baseline studies, Biota, On-site investigations, Laboratory tests, Data collections, Evaluation.
Identifiers: *Middle Fork Feather River (Calif).

A 69-mile reach of Middle Fork Feather River, California, has been designated as part of the National Wild and Scenic Rivers System. A multiagency water sampling and analysis program was undertaken to establish the quality of water in the river. Discharge in the river fluctuates in an annual pattern, high in winter and spring, low in summer, with wide differences from year to year. Water samples were collected at four gaging stations at monthly intervals to demonstrate diurnal fluctuations. Samples were collected at 37 sites along the reach to provide profiles of water quality at several times during the study. Samples were selectively analyzed in the field or in the laboratory for temperature, dissolved oxygen, specific conductance, pH, alkalinity, coliform bacteria, BOD, TOC, MBAS, color, nitrogen and phosphorus in various forms, sulfate, chloride, dissolved solids, turbidity, and suspended sediment. Water in Middle Fork Feather River is of good quality and meets most of the criteria for freshwater biota and recreational purposes. Water quality is poorest at the upstream end near Portola, and quality improves in the downstream direction, probably due to dilution by better quality water from tributaries. (Woodard-USGS)

PH-SENSITIVE FLUOROGENIC SPRAY REAGENTS: II. QUANTITATIVE STUDIES WITH PESTICIDES,
Dalhousie Univ., Halifax (Nova Scotia). Trace Analysis Research Centre.
R. W. Frei, and P. E. Belliveau.
Chromatographia. Vol 5, No 5, p 296-300. 1972. Illus.
Identifiers: Fluorogenic, *Pesticides, Quantitative methods, Spray reagents (Fluorometric), Hydrogen ion concentration.

A new spray using DDQ (1,2-dichloro-4,5-dicyanobenzoquinone) for the in situ fluorometric detection of sulfur-containing pesticides on thin-layer chromatograms was studied in order to evaluate the quantitative potential of the method. The effects of pH, various adsorbents, spray solvents and concentrations, U.V. irradiation and time on the fluorescent intensity of the spots were investigated and the optimum conditions were established. An average reproducibility of 5% relative standard deviation and an average detection limit of 0.05microgram/spot were obtained. Linear calibration curves up to 5 microgram/spot and extending through the point of origin were observed. This method was used successfully to analyze a natural water sample containing 2 ppb of malathion.--Copyright 1973, Biological Abstracts, Inc.

he s-triazine and substituted urea herbicides are viewed briefly, with particular reference to their xtraction, clean-up, separation by thin-layer romatography (TLC), and detection. A number TLC systems were found for the complete paration of atrazine from linuron. On the chro-atoplate both the silver nitrate spray followed by V-irradiation, and the tert-butyl hypochlorites pray followed by iodidestarch can detect the her-cides in the submicrogram range. Under these xperimental conditions acetonitril was the most seful extracting solvent. A detailed procedure for e simultaneous detection of atrazine and of linu-n by TLC is given, which is applicable to sam-es of egg, blood, muscle, liver, corn plant, icken feed, milk, soil, and water. The method is nsitive to 0.1 ppm or even lower with ap-opriate clean-up procedures. The thoroughness the clean-up necessary depends on the nature of e sample. For this purpose, hexane partitioning, d chromatography on polyethylene-coated alu-ina, alumina, and Florisil have been used chiefly. ecovery of the 2 herbicides, using the above rocedure, ranged from 80-92%.--Copyright 1972, iological Abstracts, Inc.

ERCURY LEVELS IN WISCONSIN FISH AND VILDLIFE,
isconsin Dept. of Natural Resources, Madison.
J. Kleinert, and P. E. Degurse.
is Dep Nat Resour Tech Bull. 52, p 1-22, 1972, us.
entifiers: Deer, Duck, *Fish, Goose, Grebe, eron, *Mercury, Pheasant, Rabbit, Ruffed ouse, Squirrel, Swan, *Wildlife, *Wisconsin.

ercury determinations were made on 1824 fish let samples representing 139 locations covering of Wisconsin's 72 counties and boundary aters of Lake Michigan, Green Bay, Lake Su-erior, and the Mississippi River. All Wisconsin sh analyzed contained some Hg, and those from aters removed from any known source of Hg use veraged .19 ppm and ranged between .01-.60 ppm g. The highest levels, averaging about 1 ppm and nging between .10-4.89 ppm, occurred in fish ken from sections of the Chippewa, Flambeau d Wisconsin Rivers located below paper mills d below a Hg cell chlorine-caustic soda plant. ifferent species vary in Hg content, and the rger fish often contain higher concentrations an do smaller fish of the same species taken om the same water. Fish samples taken from the llowing areas contained Hg levels averaging ove the .5 ppm guideline established by the od and Drug Administration for banning fish om interstate markets: the 350-mile stretch of the isconsin River below Rhinelander, 40 miles of e Flambeau River between Cedar Rapids and the nction with the Chippewa River, and 50 miles of e Chippewa River from the junction with the ambeau River to Eau Claire. Hg determinations ere made on 234 wildlife muscle samples and 220 ildlife liver samples. The common game species ere sampled including deer, rabbits, squirrels, ffed grouse, pheasants, puddle ducks, diving cks and geese. Swans, pied-bill grebes and blue rons were also sampled. Hg levels of most isconsin wildlife was well below .5 ppm. Water rds, including waterfowl, contained more Hg an mammals or upland game birds. Livers of div-g ducks, herons, and grebes approached or ex-ceeded .5 ppm. No geographic locations were noted where Hg seemed to be more concentrated in wildlife.--Copyright 1972, Biological Abstracts, Inc.

LASER INDUCED FLUORESCENCE IN ALGAE: A NEW TECHNIQUE FOR REMOTE DETECTION,
Sparcom, Inc., Alexandria, Va.
E. J. Friedman, and G. D. Hickman.
Available from the National Technical Information Service as N73-12527. Report No. NASA-CR-62090, October 1972. 108 p, 37 fig, 3 tab, 4 append. Contract No. NASS-2081.

Descriptors: *Remote sensing, *Absorption, *Fluorescence, *Pigments, *Pollutant identification, *Chlorophyll, Chlorophyta, Electronic equipment, Mechanical equipment, Mathematical studies, Rhodophyta, Cyanophyta, Chlamydomonas, Chlorella.
Identifiers: Chlorophyll a, Laser-excited fluorescence, Porphyridium, Lasers, Agmenellum, Carotenoids, Phycobilin, Phycoerythrin, Phycocyanin, Fluorescence spectra.

Measurement of the absorption and fluorescence spectra were obtained for four types of marine and fresh water algae using a pulsed N2/Ne dye laser as the source of excitation. The algae investigated were Agmenellum, Chlorella, Chlamydomonas, and Porphyridium. The absorption maxima for the algae ranged from 420 to 675 nm while their fluorescent spectra ranged from 580 to 685 nm. It appears feasible that various algal species can be identified by detection of their fluorescent signatures using a tunable laser as the excitation source. However, if one is concerned only with detection of chlorophyll a, the optimum excitation is approximately 600 plus or minus 50 nm while detection is at 685 nm. An analysis of both calculations and laboratory results indicates that it should be feasible to measure chlorophyll a in concentrations as low as 1.9 mg/cu m using a 100 kw peak pulsed laser from an altitude of 500 meters. (Little-Battelle)

A COMPARISON OF LIQUID SCINTILLATION AND GEIGER-MULLER ESTIMATES OF PRIMARY PRODUCTIVITY IN AN IN SITU EXPERIMENT,
Manitoba Univ., Winnipeg. Dept. of Zoology.
F. J. Ward, and M. Nakanishi.
Journal of the Fisheries Research Board of Canada, Vol 30, No 5, p 708-711, May 1973. 1 fig, 1 tab, 6 ref.

Descriptors: *Primary productivity, *Radioactivity techniques, *On-site test, *Methodology, Incubation, Algae, Photosynthesis, Water analysis, Light intensity, Carbon dioxide, On-site date collections, On-site investigations.
Identifiers: *Liquid scintillation, *Geiger-Muller estimates, *Comparative studies, Method evaluation, C-14, Sample preparation, Scintillation counting, Shiozu Bay, Lake Biwa, Japan, Error sources.

For an in situ experiment conducted in Shiozu Bay, Lake Biwa, Japan, primary productivity estimates from liquid scintillation radioactivity counts of wet algae were generally higher than those from Geiger-Muller radioactivity counts of desiccated algae. Values at 0 m were similar, the G-M estimate at 0.5 m was 10 percent higher, but from 3 to 13 m the liquid scintillation values ranged from 11 to 33 percent higher than G-M estimates. The 20-m estimates were low and similar. Differences were caused primarily by C-14 losses during desiccation prior to G-M counting. Increasing loss rates between 0.5 and 3.0 m may have been caused by decreasing light intensity. On the basis of surface area, the estimate from liquid scintillation data was 27 percent greater than that obtained from G-M data. The results indicated that previously recommended methods for sample preparation and radioactivity determinations may cause primary productivity estimates from in situ data to be significantly in error. STEAM DISTILLATION: A SIMPLE TECHNIQUE FOR RECOVERY OF PETROLEUM HYDROCARBONS FROM TAINTED FISH,
Fisheries Research Board of Canada, Halifax (Nova Scotia). Halifax Lab.
R. G. Ackman, and D. Noble.
Journal of the Fisheries Research Board of Canada, Vol 30, No 5, p 711-724, May 1973. 1 fig, 1 tab, 17 ref.

Descriptors: Fish, *Separation techniques, *Methodology, Pollutant identification, Water pollution sources, Oil pollution, *Canada.
Identifiers: *Steam distiallation, Recovery, *Petroleum hydrocarbons, Sample preparation, Muscle, Diesel oil, Gas liquid chromatography, Flame ionization, Gas chromatography, Animal tissues, *Athabaska River (N.S.), *Whitefish.

Fish caught in the Athabaska River were filleted when required, blended with distilled water and transferred to a distillation flask along with flask washings. Antibumping granules were added and the fish muscle blend was simmered for 30 min before distillation to reduce foaming. Neohexane was added to the condensate in a centrifuge tube and shaken vigorously. The neohexane layer which was allowed to separate upon standing for 1 hr or less was analyzed by flame ionization chromatography using a support-coated open-tubular (SCOT) stainless steel column. Samples of diesel oil and fish obtained from a source apparently free from contamination were examined as controls. Simple steam distillation was found to be efficacious for isolation of hydrocarbons from contaminated whitefish. Gas-liquid chromatography on support-coated open-tubular Apiezon-L columns demonstrated that hydrocarbons recovered from the tainted fish had a composition pattern qualitatively similar in detail to that from a sample of diesel oil suspected as the source of contamination. (Holoman-Battelle)

ADDITIONAL STUDIES FOR THE SPECTROPHOTOMETRIC MEASUREMENT OF IODINE IN WATER.
Beckman Instruments, Inc., Fullerton, Calif. Advanced Technology Operations.

Available from the National Technical Information Service as N73-10172. Report Nos NASA-CR-128585, FR-1116-101, August 31, 1972. 37 p, 18 fig. NAS 9-12769.

Descriptors: *Spectrophotometry, *Iodine, *Pollutant identification, *Water analysis, Measurement, *Instrumentation, Automatic control, Turbidity, Chemical analysis, Aqueous solutions, Electronics, Automation, Halogens.
Identifiers: *Iodine-iodide spectroscopy, Automated iodine monitoring system, Chemical interference, Isosbestic point.

Previous work in iodine spectroscopy is briefly reviewed. Continued studies of the direct spectrophotometric determination of aqueous iodine complexed with potassium iodine show that free iodine is optimally determined at the isosbestic for these solutions. The effects on iodine determinations of turbidity and chemical substances (in trace amounts) are discussed and illustrated. At the levels tested, iodine measurements are not significantly altered by such substances. The main objective of the present work--a preliminary design for an on-line, automated iodine monitor with eventual capability of operating also as a controller--is

analyzed and developed in detail with respect to optics, mechanics, and circuitry. The resulting design features a single beam colorimeter operating at two wavelengths (using a rotating filter wheel). A flow-through sample cell allows the instrument to operate continuously, except for momentary stop flow when measurements are made. The timed automatic cycling of the system may be interrupted whenever desired, for manual operation. An analog output signal permits controlling an iodine generator. (Holoman-Battelle)

CHARACTERIZATION OF SWEET POTATO PROCESSING WASTES,
North Carolina State Univ., Raleigh.
B. W. Raines.
Available from--Univ. Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 73-1201. Ph D Dissertation, 1972. 78 p.

Descriptors: *Industrial wastes, *Food processing industry, *Sweet potatoes, Biochemical oxygen demand, Chemical oxygen demand, Carbohydrates, Cellulose, Lignins, Biodegradation, Carbon, Waste treatment, *Waste identification, *Pollutant identification.
Identifiers: Characterization, Sugars, Starches, Pectin gums, Mucillages, Hemicelluloses.

Characterization of liquid waste from sweet potato processing plants was conducted in three stages. These were: (1) A study of waste strength as defined by 5-day biochemical oxygen demand, chemical oxygen demand (COD) and total carbon (TC). (2) A study of the potential biodegradability of the waste via chemical determination of individual carbohydrate components. (3) A study of the effect of acclimated versus nonacclimated seed organisms on the biochemical oxgyen demand test. The 'readily biodegradable' carbohydrate of sweet potato waste constituted 88 percent of the total carbohydrate, dry weight basis and included sugars (17 percent), starch (56 percent) and pectin gums and mucillages (15 percent). Less 'readily biodegradable' carbohydrates were hemicelluloses (5 percent), cellulose (1 percent) and lignin (0.5 percent). The data demonstrated that substrate availability was not a limiting factor in the 5-day BOD method for sweet potato waste. duplicate analyses of acclimated seed versus unacclimated seed organisms on BOD revealed little difference in results when utilizing culture material obtained from aerated raw sewage and one grown under conditions experienced in the BOD test. 'Most probable numbers' reached 5 million/ml in one to two days then rapidly decreased to 300/ml at five days. Preliminary investigations indicated that nitrogen and/or phosphorus concentrations in the BOD analysis were limiting to bacterial growth and may explain the low BOD results. (Little-Battelle)
W73-12852

AROMATIC HYDROXYLATION AS AN ANALYTICAL REACTION,
Wisconsin Univ., Madison.
K. S. Albert.
Available from--Univ. Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 72-31,511. Ph D Dissertation, 1972. 169 p.

Descriptors: *Aqueous solutions, *Aromatic compounds, *Chemical reactions, *Chemical analysis.
Identifiers: *Hydroxylation, *Sample preparation, Cyclodextrin, Glucose, Calibration curves, Benzene, Chemical interference.

The Hamilton hydroxylating system, an aqueous solution of ferric ion, catechol, and hydrogen peroxide, hydroxylates aromatic compounds in aqueous solution. The further development and application of this system to the quantitative determination of some aromatic compounds are reported. By reducing the initial ratio of peroxide to aromatic to 2.0 or less, stable absorbance values were obtained, the yield depending upon the ratio. The instability of the initial hydroxylation product has been overcome by incorporating a 'stabilizer' in the reaction mixture. Two such modified Hamilton systems which were studied extensively are those of cyclodextrin at 25 degrees and glucose at 25 degrees and 75 degrees. Using the cyclodextrin-modified Hamilton system, many mono- and disubstituted benzene derivatives give linear absorbance-concentration responses in the range 0.0001-0.0008 M with apparent molar absorptivities between 1000 and 5000. The glucose-modified Hamilton hydroxylating system has been suggested for the analysis of aromatic compounds at 75 degrees. Calibration curves were linear in the range 0.0001-0.0001 M of aromatic compound, and molar absorptivities of 1000-5000 were observed. The results establish that (a) hydroxylation is a useful analytical process; (b) a model enzyme system can be exploited for its analytical utility; and (c) the concept of developing analytical selectivity by means of complex formation with cyclodextrins may be worth further exploitation. As one of the few methods available for the phenyl group as a functional group for analytical purposes, this technique has the advantages and limitations of a general functional group method. (Little-Battelle)
W73-12853

PARTICULATE MANGANESE IN SEA WATER STRESSING REGIMES IN MARINE ANOXIC BASINS,
Washington Univ., Seattle.
E. J. Fluorie.
Available from--Univ. Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 73-3708. Ph D Dissertation, 1972. 150 p.

Descriptors: *Sea water, *Manganese, *Dissolved oxygen, *Distribution patterns, *Hydrogen sulfide, Spectroscopy, Suspended solids, *Columbia River, Mathematical models.
Identifiers: *Emission spectroscopy, Saanich Inlet.

A method for the analysis of particulate Mn using emission spectroscopy was developed to determine the concentration of Mn in suspended matter. The distribution of particulate Mn in five anoxic basins was observed. The differences and similarities of these basins are shown by data obtained on their chemical and physical characteristics. In addition, the distributions of both particulate Mn and the physical and chemical variables were monitored in Saanich Inlet, a basin whose oxygen-hydrogen sulfide regime changes monthly. The particulate Mn distribution in the observed basins showed a consistent pattern which can be correlated to the oxygen and hydrogen sulfide regime. The results indicate Mn exists mainly in particulate form in the oxygenated water and in a soluble form in water containing hydrogen sulfide. A model based on chemical thermodynamics and inferred kinetics is proposed to explain the distribution of particulate Mn in marine anoxic basin. The concentrations of particulate Mn in the open ocean were found to be low unless influenced by land runoff and the values of the Columbia River reflected the particulate matter distribution described by previous investigations. DETERMINATION OF LEAD IN PETROLEUM ADDITIVES USING ATOMIC ABSORPTION SPECTROPHOTOMETRY,
Vanderbilt (R. T.) Co., Inc., East Norwalk, Conn.
G. R. Supp, I. Gibbs, and M. Juszli.
Atomic Absorption Newsletter, Vol 12, No 3, p 66-67, May-June 1973. 1 fig, 3 tab, 5 ref.

Descriptors: *Oil, *Lead, Heavy metals.
Identifiers: *Atomic absorption spectrophotometry, *Sample preparation, Lubricating oil, Grease, Crankcase oil, Lubricants, Lead diamyldithiocarbamate, Lead naphthenate, Lead dinonylnaphthalene sulfonate, Accuracy.

Petroleum samples were analyzed for lead compounds by dissolving samples and stardards directly in methyl isobutyl ketone and analyzing by atomic absorption. This procedure eliminated separations and acid breakdown followed by titration or precipitation reactions. Results of analysis by AA and wet chemistry agreed within experimental error when samples containing lead cyclohexanebutyrate, lead diamyldithiocarbamate, lead naphthenate, or lead dinonylnaphthalene sulfonate were analyzed. (Little-Battelle)

AN IMPROVED AA MICROSAMPLING SYSTEM,
Perkin-Elmer Corp., Norwalk, Conn.
F. J. Fernandez.
Atomic Absorption Newsletter, Vol 12, No 3, p 68-70, May-June 1973. 2 fig, 1 tab, 4 ref.

Descriptors: *Laboratory equipment, *Lead, Heavy metals, Mechanical equipment.
Identifiers: *Atomic absorption spectrophotometers, *Reproducibility, *Microsampling system, Blood, Atomic absorption spectrophotometry, Precision.

The Perkin-Elmer AA Microsampling System has been redesigned to improve performance, mechanical stability, and ease of operation. The changes include a new mounting system which attaches directly to the burner mount base, a slide mechanism having a smoother and shorter action, a heat shield usable with both the Delves Cup and Sampling Boat systems, plus a new mounting system for the Sampling Boat which permits rapid boat installation and interchange. Blood samples analyzed for lead show that the reproducibility of results is very good using the new system. (Little-Battelle)

AN IMPROVED METHOD FOR DETERMINING ORGANICS BY ACTIVATED CARBON ADSORPTION AND SOLVENT EXTRACTION - PT. II (TEST METHOD),
National Environmental Research Center, Cincinnati, Ohio.
R. W. Buelow, J. K. Carswell, and J. M. Symons.
Journal of the American Water Works Association, Vol 65, No 3, p 195-199, March 1973. 2 fig, 2 tab, 8 ref.

Descriptors: *Solvent extractions, *Adsorption, *Pollutant identification, *Activated carbon, Water pollution, Organic wastes, Organic compounds, Laboratory tests, Water analysis, Water sampling, Storage, Waste water (Pollution), Organic matter, Waste identification, Distillation, Gravimetric analysis.
Identifiers: *Dissolved organic matter, CAM sampler, Carbon chloroform extract, Carbon alcohol extract, Organic solvents.

The complete test procedure is presented for determining organics in water in the dissolved

form by activated carbon adsorption and solvent extraction. Organic materials adsorbed on a sample of activated carbon are removed by sequential extraction with two organic solvents. The extracts are processed by volume reduction through distillation and drying. The quantities of organic materials are then determined gravimetrically. This method is primarily for monitoring the general organic content of water and is not designed as a collector of organics for further identification, although, with certain precautions, the resulting extracts can be reprocessed. This method does not require expensive instrumentation and divides the organics into 2 general classes - chloroform soluble and alchol soluble. A special sampler (miniature CAM sampler) must be used in order to obtain a representative sample for this method. (See also W73-07574) (Holoman-Battelle)

THE MONITORING OF ORGANIC MATTER WITH POLYURETHANE FOAM,
Manitoba Univ., Winnipeg. Dept. of Chemistry.
H. D. Gesser, A. B. Sparling, A. Chow, and C. W. Turner.
Journal of the American Water Works Association, Vol 65, No 3, p 220-221, March 1973. 1 fig, 8 ref.

Descriptors: *Organic matter, *Monitoring, *Water analysis, Water pollution, *Pollutant identification, Organic compounds, Methodology, Organic wastes, Waste water (Pollution), Water treatment, Solvent extractions, Efficiencies, Chemical analysis.
Identifiers: Polyurethane foam, Trace levels, Electron capture gas chromatography, Sample preparation.

Standard carbon adsorption apparatuses with the carbon replaced by previously cleaned and extracted polyurethane foam plugs were installed at the municipal water treatment plant at Morris, Manitoba, to determine the feasibility of the test method and the efficiency of the water treatment process. Water from the Red River which enters the plant is treated by the carbon-alum-chlorine method. The foam plugs were extracted with Lexane, concentrated in a flash evaporator, made up to a standard volume, and analyzed by electron capture gas chromatography. The results obtained showed that the treatment process did not reduce the organic contaminant level to any significant extent. The use of polyurethane foam plugs is a promising alternate to the carbon adsorption method for the determination of trace organic contaminants in water. (Holoman-Battelle)

CHARACTERIZATION OF CHEMICAL SLUDGES,
Missouri Univ., Columbia. Dept. of Civil Engineering.
R. J. Calkins, and J. T. Novak.
Journal of the American Water Works Association, Vol 65, No 6, p 423-428, June 1973. 8 fig, 5 tab, 6 ref.

Descriptors: *Sewage sludge, *Waste identification, Sludge treatment, Pollutant identification, *Missouri River, Solid wastes, Filtration, Coagulation, Water pollution sources, Treatment facilities, Missouri.
Identifiers: Characterization, *Chemical sludges, Settleable solids, Specific resistance, Cake solids, Filtration rates, Settleability, Cationic flocculants, Softening sludges.

The characteristics of sludges generated from the Missouri River were determined. The sludges collected from several treatment plants were characterized by their settled-solids concentration, filtering rate which includes the parameter 'specific resistance', and cake solids. The solids concentrations in the settled sludges were found to vary to some extent with the type of coagulant used, the turbidity of the water, and, in the case of mixed sludges (softening-coagulant), the variations in the lime dose. In evaluating sludge characteristics generated from a combined softening and coagulation process, it was found that the concentration of magnesium may greatly influence the results obtained. Comparisons of sluge solids from processes where no lime was added indicate that sludges generated from turbid waters can be expected to attain much higher settled-solids concentration than sludges from relatively clean waters. A relationship between cake solids and settled solids was found to exist for all sludges in this study. No simple relationship was found to exist for specific resistances of the various sludges. Several trends can be seen from the data, however. In general, combined softening-coagulant sludges filter much more readily than do pure coagulants. The presence or absence of magnesium seemed to have no influence on filtering characteristics of mixed sludges. Changes in the sludge characterization parameters occurred with time, primarily for the iron and alum residues. None of the changes was dramatic, but all indicate that sludge initally discharged from a treatment plant is somewhat different from sludge that is stored or lagooned. (Holoman-Battelle)

SODIUM TUNGSTEN BRONZE AS A POTENTIOMETRIC INDICATING ELECTRODE FOR DISSOLVED OXYGEN IN AQUEOUS SOLUTION,
Ames Lab., Iowa.
P. B. Hahn, M. A. Wechter, D. C. Johnson, and A. F. Voigt.
Analytical Chemistry, Vol 45, No 7, p 1016-2021, June 1973. 10 fig, 4 tab, 10 ref.

Descriptors: *Dissolved oxygen, *Aqueous solutions, *Pollutant identification, *Indicators, *Chemical analysis, Chemical reactions, Inorganic compounds, Hydrogen ion concentration, Temperature, Iron, Copper, Mercury, Cations.
Identifiers: Sodium tungsten bronze electrodes, *Potentiometry, Precision, Accuracy, Ionic interference, EDTA, Chemical interference, Reproducibility.

Sodium tungsten bronzes, nonstoichiometric compounds, NaxWO3, with 0.5 less than x less than 0.9 were found to respond potentiometrically to dissolved oxygen in basic solutions. A Nernstian response, with a slope of approximately 120 mV per decade, was exhibited in the concentration range 0.2-8 ppm. Oxygen analyses were made in this range with precision and accuracy approaching plus or minus 5 percent. The large slope and other observations place serious doubt on customary oxygen redox reactions as possible mechanisms. An absorption mechanism is proposed which involves the displacement of adsorbed hydroxide ions by molecular oxygen. (Holoman-Battelle)

POLYAROMATIC HYDROCARBONS IN HIGH--BOILING PETROLEUM DISTILLATES. ISOLATION BY GEL PERMEATION CHROMATOGRAPHY AND IDENTIFICATION BY FLUORESCENCE SPECTROMETRY,
Bureau of Mines, Laramie, Wyo. Laramie Energy Research Center.
J. F. McKay, and D. R. Latham.
Analytical Chemistry, Vol 45, No 7, p 1050-1055, June 1973. 11 fig, 2 tab, 17 ref.

Descriptors: *Separation techniques, Oil, Ion exchange, Pollutant identification.
Identifiers: *Polyaromatic hydrocarbons, *Gel permeation chromatography, *Ion exchange chromatography, *Thin layer chromatography, *Fluorescence spectroscopy, 1.12 2.3-dibenzoperylene, 1 12-o-phenyleneperylene, pyreno- (1.3:10'.2')pyrene, 2.3 10.11-dibenzoperylene, 1 2 4 5-dibenzopyrene, benzo (e)pyrene, benzo (g)chrysene, Crude oil, Petroleum distillates.

The identification of seven polyaromatic ring systems in petroleum is reported. The ring systems are 1.12,2.3-dibenzoperylene; 1,12-o-phenyleneperylene, pyreno- (1.3:10'.2')pyrene; 2.3,10.11-dibenzoperylene; 1,2,4,5-dibenzopyrene, benzo (e)pyrene, and benzo (g)chrysene. These polyaromatic hydrocarbons were isolated by a separation scheme involving ion exchange chromatography, gel permeation chromatography, and thin-layer chromatography and were identified by fluorescence spectroscopy. Gel permeation chromatography separated pericondensed aromatic ring systems from catacondensed ring systems and the other components of an acid concentrate. (Little-Battelle)

OPTIMUM PROCEDURE FOR THE DETERMINATION OF SELENIUM IN BIOLOGICAL SPECIMENS USING SE-77M NEUTRON ACTIVATION,
Veterans Administration Hospital, Omaha, Nebr.
A. J. Blotcky, L. J. Arsenault, and E. P. Rack.
Analytical Chemistry, Vol 45, No 7, p 1056-1060, June 1973. 5 fig, 2 tab, 14 ref.

Descriptors: *Neutron activation analysis, *Data processing, Radioactivity techniques, Irradiation, Pollutant identification.
Identifiers: *Tissue, *Blood, *Selenium, Biological samples, Sample preparation, Se-77m, Detectors, Detection limits.

An optimum procedure is outlined for the rapid quantitative determination of trace (greater than or equal to 0.06 microgram) selenium in serum and tissue using Se-77m neutron activation. Sample preparation, irradiation procedures, types of detector assemblies, and spectral analyses and data reduction are discussed. The optimum procedure tuilizing a low-power nuclear reactor consisted of irradiating lyophilized tissue samples or dialyzed-lyophilized serum samples for 20 sec, with a 20-sec decay time prior to radioassay. The most suitable radioassay assembly was the 5-mm X 3-in NaI (Tl) detector system. Spectral analyses and data reduction consisted of eliminating the interferences of isotopes of relatively long half-lives by spectrum subtraction and correction. Comparisons between the results obtained by the discussed Se-77m procedure and values quoted for an NBS Bovine Liver Standard were excellent. (Little-Battelle)

APPLICATION OF LIQUID CHROMATOGRAPHY TO POLLUTION ABATEMENT STUDIES OF MUNITION WASTES,
Army Natick Labs., Mass. Pioneering Research Lab.
J. T. Walsh, R. C. Chalk, and C. Merritt, Jr.

Analytical Chemistry, Vol 45, No 7, p 1215-1220, June 1973. 9 fig, 1 tab, 8 ref.

Descriptors: *Waste water (Pollution), *Water analysis, *Adsorption, *Resins, Industrial wastes, Pollution abatement, Separation techniques, Color, Activated carbon, Fish, Toxicity.
Identifiers: *TNT, *Liquid chromatography, Munitions plants, Amberlite XAD-2, Chromatograms, Styrene-divinylbenzene copolymer.

Since waste waters from TNT manufacture contain nitrobodies which are toxic (2.5 ppm toxic to fish), explosive, and colored, they consititute a serious pollution hazard. The application of liquid chromatography to pollution abatement studies of TNT waste waters is described. These studies include the characterization by liquid chromatography of the color formation occurring in TNT water, the development of a simple, direct analysis for alpha-TNT and a description of how liquid chromatography was used to evaluate pollution abatement processes for the removal of nitrobodies from munition waste waters. The abatement processes investigated were the column adsorption type, which required absorption isotherm, breakthrough capacity, saturation capacity, and column regeneration efficiency data. The acquisition of these data by liquid chromatographic means is described. The results showed that an adsorbent resin of the styrene-divinylbenzene copolymer type possessed nitrobody adsorption efficiencies at least equal to those of activiated carbon and had the important added advantages of easy chemical regeneration and significantly long life cycle. (Little-Battelle)

THE ASSOCIATION OF AMPHIPODS IN THE SHALLOW-WATER SAND HABITAT OF STRANGFORD LOUGH, CO. DOWN,
Queen's Univ., Belfast (Northern Ireland). Dept. of Zoology.
A. A. Fincham.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 1, p 119-125, February 1973. 3 fig, 2 tab, 12 ref.

Descriptors: *Amphipoda, *Shallow water, *Systematics, *Speciation, Crustaceans, Benthic fauna, Dominant organisms, Sands, Marine animals, Invertebrates, Coarse sediments, Fluvial sediments, Saline soils, Soil analysis, Animal groupings, Classification, Varieties.
Identifiers: *Marine habitats, Strangford Lough, Beach fleas, Macroinvertebrates, Arthropods, Marinogammarus, Hippomedon denticulatus, Ampelisca brevicornis, Bathyporeia guilliamsoniana, Urothoe marina, Harpinia antennaria, Stenothoe monoculoides, Perioculodes longimanus, Pontocrates arenarius, Gammarus locusta, Dexamine spinosa, Aora typica, Microdeutopus chelifer, Lembos longipes, Microprotopus maculatus, Eurystheus maculatus, Jassa falcata, Ericthonius brasiliensis, Corophium crassicorne, Phtisica marina, Bathyporeia nana, Urothoe elegans.

Ten stations were sampled in the shallow-water sand habitat of Strangford Lough using a naturalist's dredge. Sediment samples were analyzed to determine median diameter (ranging from 1.13 to 3.23 phi), Phi quartile deviation (ranging from 0.17 to 0.65 phi) and Phi quartile skewness (ranging from -0.11 to -0.04 phi). Twenty-two species of amphipod belonging to thirteen families were identified; ten species were new records for Strangford Lough and the Family Phoxocephalidae was recorded for the first time. The average number of species per station was nine and average abundance was 660 amphipods per station. The most frequently occurring species was the caprellid Phtisica marina (present in 90 percent of the samples); the overall dominant species was the corophiid Corophium crassicorne representing 52 percent of all specimens recorded. A matrix of indices of similarity between stations based on species composition and of sediment type based on median diameter showed a close correlation; infaunal species showed a marked preference for sediment type. There were two main groupings: (1) at the entrance to the Lough, characterized by coarser sediments and rapid tidal streams and (2) stations further in the Lough with finer sediments and more gentle water movement. The evolution of this amphipod fauna is discussed and compared with the adjacent western Irish Sea shallow-water sand amphipod fauna. Post-glacial isolation and fine sediment deposition have acted as selection pressures in maintaining the association of amphipods found. (Holoman-Battelle)

BIOMASS CHARACTERISTICS OF THE ASIDIAN MOLGULA MANHATTENSIS (DEKAY),
Maryland Univ., Solomons. Natural Resources Inst.
D. H. Hamilton, Jr., and J. Yurchyk.
Chesapeake Science, Vol 14, No 1, p 67-68, March 1973. 2 tab, 6 ref.

Descriptors: *Biomass, *Biological properties, Invertebrates, Regression analysis, Volume, Marine animals, Secondary productivity, Chemical analysis.
Identifiers: *Macroinvertebrates, *Molgula manhattensis, *Tunicates, Characterization, Linear regression analysis, Dry weight, Wet weight, Ash-free dry weight.

Data are reported on wet weight, dry weight, ash-free dry weight, and volume for a random sample of 101 Molgula for the purpose of simplifying future calculations of its productivity. The relationships were examined between the various weight measures and between volume and weight by linear regression analysis. The average measurements were as follows (range in parentheses): Volume, 5.26 cc (0.67-11.56 cc); dry weight, 0.125 g (0.02-0.26 g); wet weight, 3.98 g (0.43-9.09 g); ash-free dry weight, 0.05 g (0.01-0.09 g). The correlation of volume with either weight measure is not strong and this is probably a consequence of assuming a spherical shape. Each of the weight measures is strongly correlated with the others (r greater than 0.90); in the future measurement of wet weight alone will permit rapid determination of biomass in the preferred units of ash-free dry weight. (Holoman-Battelle)

TOTAL MERCURY ANALYSIS: REVIEW AND CRITIQUE,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
R. S. Reimers, W. D. Burrows, and P. A. Krenkel.
Journal Water Pollution Control Federation, Vol 45, No 5, p 814-828, May 1973. 2 tab, 156 ref.

Descriptors: *Analytical techniques, *Reviews, *Mercury, *Documentation, *Methodology, *Evaluation, Heavy metals, Aqueous solutions, Inorganic compounds, Neutron activation analysis, Polarographic analysis, Volumetric analysis, Colorimetry, Oxidation, Gravimetric analysis, Sediments, Soil analysis, Water analysis, Ion exchange, Chemical precipitation, Reduction (Chemical), Mass spectometry, Cations, Neutralization, Chemical reactions, Photometry, X-ray fluorescence.
Identifiers: Organomercury compounds, Biological samples, Environmental samples, Sample preparation, Chemical interference, Natural waters, Atomic absorption spectrophotometry, Ion selective electrodes, Dithizone method, Wet oxidation method, Amperometry, Flameless atomic absorption spectrophotometry, Preconcentration, Animal tissues, Blood, Errors, Electrodeposition, Mercuric sulfide, Mercurous chloride, Mercurous iodate, Mercurous oxalate, Mercurous cupferron, Mercurous chromate, Mercurous vanadate, Mercurous molybdate, Mercurous tungstate, Catalysis, Catalytic methods, Complexiметric titration, Oxidimetric titration, Iodide selective electrode, Detection limits, Sensitivity, Dimethyl mercury, Spark source mass spectrometry, Emission spectroscopy, Pyrolysis.

With the recent concern about mercury as an environmental hazard came numerous reviews and a large amount of research concerning new methods of mercury analysis. The history and an extensive literature review of mercury analysis are presented, as well as a critique of the different methods. Conclusions are presented as to the best method in terms of convenience, cost, simplicity, and sensitivity. At present, wet oxidation with potassium permanganate and potassium persulfate followed by chemical reduction and analysis of the elemental mercury by flameless atomic absorption spectroscopy is the most convenient method for determining total mercury. Economically, the best method remains the classical colorimetric dithizone technique. Atomic absorption instrumentation, because of its economy, simplicity, and sensitivity, is the most useful method for mercury analysis. (Holoman-Battelle)

SPECTROPHOTOMETRIC DETERMINATION OF AMMONIA,
Cham/Hill, Corvallis, Oreg.
C. Zadorojny, S. Saxton, and R. Finger.
Journal Water Pollution Control Federation, Vol 45, No 5, p 905-912, May 1973. 6 fig, 2 tab, 15 ref.

Descriptors: *Ammonia, *Water analysis, Sea water, Estuaries, Colorimetry, *Spectrophotometry, Salinity, *Waste water (Pollution), Ureas, Amino acids, Electrolytes, Absorption, Nitrites, Nitrates, Sulfides, Iodides, Carbonates, Bicarbonates, Fluorides, Copper, Manganese, Cadmium, Zinc, Mercury, Lead, Cobalt, Nickel, Aluminum, Iron, Ions, Freshwater.
Identifiers: Chemical interference, Detection limits, *Indophenol blue method, Sample preparation, Reproducibility, Chemical recovery, Cyanides, Thiocyanates, Thiosulfates, Barium, Tin, L-alanine, L-arginine, L-aspartic acid, L-histidine-HC, Glycine, L-hydroxyproline, L-isoleucine, L-lysine-HCI, L-methionine, L-phenylalanine, L-proline, L-serine, L-threonine, L-tryptophan, L-tyrosine, L-valine, Sulfites.

An improved indophenol blue method was investigated for the determination of ammonia in fresh, estuarine and marine waters, and wastewaters. Absorbance curves were prepared by adding known amounts of ammonium-nitrogen to ammonia-free water and to Pudget Sound seawater. Wastewaters were diluted, spiked, and analyzed to determine reproducibility of the method. Analyses were conducted to study the effects of 20 inorganic electrolytes, urea, or amino acids. No major interferences occured with these substances or as a result of variations in salinity. The range of ammonia determination was as follows: with intensifier, 0.001 to 1.0 mg/l ammonia nitrogen; without intensifier, 1 to 51 mg/l ammonia nitrogen. It is concluded that the method is simple and well suited for routine use. (Little-Battelle)

ATP POOLS IN PURE AND MIXED CULTURES,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
I. C. Kao, S. Y. Chiu, L. T. Fan, and L. E. Erickson.
Journal Water Pollution Control Federation, Vol 45, No 5, p 926-931, May 2973. 6 fig, 1 tab, 7 ref.

Descriptors: *E. coli, *Methodology, *Monitoring, Activated sludge, Sludge treatment, Efficiencies, Bioindicators, Cultures, Centrifugation, Cytological studies, Aerobic bacteria, Sewage bacteria.
Identifiers: *Adenosine triphosphate, *Pseudomonas aeruginosa, Firefly luminescence, Cul-

ture media, Luciferin-luciferase method, Mixed cultures, Pure cultures, Species interaction, Bacterial physiology, Glucose, Sample preparation.

E. coli and Pseudomonas aeruginosa were grown in a mixed culture for about 9 hr at 30C with glucose as an energy source. The same organisms were also grown separately in the same medium. After recovery, washing and drying, the glucose concentration was determined by the glucostat method and ATP concentration by use of a biometer. The sample was prepared for ATP measurement by mixing one ml of culture broth with one ml butanol for 10 sec to lyse the cells. Eight ml of octanol was added, the sample was vigorously shaken for 10 sec and centrifuged at 3000 rpm for 3 min. Butanol was partitioned into the top octanol layer and ATP into the bottom aqueous layer. The extracted ATP (0.01 ml) was then injected into a biometer tube containing luciferin and luciferase. The resultant light flash was converted into an electrical signal and then a decimal count representing the concentration of ATP in the sample. The fact that the ATP concentration in the cells from the mixed culture was appreciably smaller than that in the pure cultures indicated that the species in the mixed culture interact. The fact that cell yields in mixed cultures were far smaller than those in pure cultures also indicated the existence of such interaction. (Mortland-Battelle)

AN IMMOBILIZED CHOLINESTERASE PRODUCT FOR USE IN THE RAPID DETECTION OF ENZYME INHIBITORS IN AIR OR WATER,
Midwest Research Inst., Kansas City, Mo.
L. H. Goodson, W. B. Jacobs, and A. W. Davis.
Analytical Biochemistry, Vol 51, No 2, p 362-367, February 1973. 1 fig, 1 tab, 5 ref.

Descriptors: *Monitoring, *Water pollution, *Insecticides, Pollutant identification, Air pollution, Organophosphorus pesticides, Carbamate pesticides, Adsorption, Stability, Methodology.
Identifiers: *Enzymatic inhibitors, *Cholinesterase, *Enzyme activity, Enzyme preparation.

Cholinesterase has been immobilized on the surface of open-pore urethane foam in a two-step process in which (1) cholinesterase is adsorbed on aluminum hydroxide gel during the precipitation of the aluminum hydroxide from a solution of aluminum chlorohydroxide, and (2) the aluminum hydroxide gel-enzyme precipitate is suspended in a starch slurry and applied to urethane foam. The resulting product is shown to retain its activity during monitoring of water for the presence of certain organophosphate and carbamate insecticides. Details are given for the preparation of both the plain starch gel-immobilized product and for the improved aluminum hydroxide gel-starch gel enzyme pads. (Holoman-Battelle)

AN EVALUATION OF LIQUID SCINTILLATION COUNTING TECHNIQUES FOR USE IN AQUATIC PRIMARY PRODUCTION STUDIES,
Queen Elizabeth Coll., London (England). Dept. of Biology.
P. R. Pugh.
Limnology and Oceanography, Vol 18, No 2, p 310-319, March 1973. 2 fig, 1 tab, 25 ref.

Descriptors: *Evaluation, *Primary productivity, Methodology, *Radioactivity techniques, *Aquatic environment, Aquatic productivity, Carbon radioisotopes, Diatoms, Chrysophyta, Marine algae, Yeasts, Marine fungi, Phytoplankton, Surfactants.
Identifiers: *Liquid scintillation, *Scintillation counting, Membrane filters, Accuracy, Reagents, Solubilization, Phaeodactylum tricornutum, Metschnikovia zobelli, Soluene-100, Hyamine 10-X, Triton X-100, NCS, C-14.

Methods evaluated for the liquid scintillation counting of samples from aquatic primary production studies include the counting of intact filters and cells in a toluene fluor, solubilization and counting of membrane filters and cells in various reagents, and counting of a suspension of cells mixed with the fluor. A 1:1 Triton X-100:toluene fluor was very effective for the suspension of cells and gave high counting efficiencies. Up to 5 ml of sample could be mixed with the fluor, but this was considered inadequate for most primary production studies. The filter standardization method for the counting of intact filters was investigated further and found to be applicable over a wide range of conditions but only accurate when the weight of algae on the filters was small (less than 1 mg). Direct solubilization of the filters and cells in a naphthalene-dioxane or 2-methoxyethanol-toluene fluor were the simplest, most accurate, and economical methods for primary production studies; the latter dissolved both wet and dry cellulose nitrate membrane filters and gave excellent replicate counting. (Holoman-Battelle)

MEMBRANE FILTER RETENTION--A SOURCE OF ERROR IN THE C-14 METHOD OF MEASURING PRIMARY PRODUCTION,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Environmental Research Branch.
J. W. McMahon.
Limnology and Oceanography, Vol 18, No 2, p 319-324, March 1973. 5 fig, 1 tab, 10 ref.

Descriptors: *Primary productivity, Methodology, *Water analysis, *Radioactivity techniques, *Retention, *Measurement, Phytoplankton, Volume, Carbon radioisotopes, Absorption, Chemical analysis.
Identifiers: *Membrane filters, *Error sources, Liquid scintillation, Scintillation counting, C-14, Asterionella formosa, Maskinonge Lake, Grenadier Pond.

The relationship between volume of water filtered and apparent specific activity of phytoplankton in which the latter decreases (cpm C-14/ml) with increasing volume filtered, previously attributed to cellular damage to phytoplankton during vacuum filtration, is now considered mainly due to retention of unfixed radiotracer on the membrane filter. The retention capacity for C-14 by the filter, expressed as radioactivity per milliliter filtered, is maximum for small sample volumes (less than or equal to 1 ml), decreasing to a constant value when sample volumes are larger than 100 ml. This is attributed partially to adsorption in the filter and probable retention of C-14 bound to unknown substances in the water or on the filter which are eluted or exchanged by passage of volumes of water of 100 ml or greater. This 'washing' effect permits almost all of the C-14 not fixed in organisms to pass through the filter. (Holoman-Battelle)

SUGAR-COATED DAPHNIA: A PRESERVATION TECHNIQUE FOR CLADOCERA,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
D. J. Hall.
Limnology and Oceanography, Vol 18, No 2, p 331-333, March 1973. 1 fig, 4 ref.

Descriptors: *Daphnia, *Methodology, Zooplankton, Invertebrates, *Crustaceans.
Identifiers: *Sample preservation, *Sucrose, Macroinvertebrates, Daphnia pulex, Daphnia galeata.

A simple preservation technique is described which utilizes sucrose to prevent carapace distortion and loss of broodpouch contents due to ballooning in Daphnia. Zooplankton samples collected from Little Mill Lake by vertical tows of a 75-micron-mesh plankton net through 9 m were transferred to a 75-micron Nitex screen glued to the bottom of an acrylic cylinder, immersed in carbonated water, washed into sample bottles containing appropriate concentrations of sucrose and 4 percent formalin. Carapace distortion and loss of eggs by preserved specimens were prevented by adding 40 g/liter sucrose to 4 percent formalin. Differences in size and species composition may influence the threshold sugar concentration at which ballooning is prevented. (Holoman-Battelle)

QUANTITATIVE SAMPLING OF LIVE ZOOPLANKTON WITH A FILTER-PUMP SYSTEM,
Pacific Gas and Electric Emeryvill, Calif. Engineering Research Dept.
J. W. Icanberry, and R. W. Richardson.
Limnology and Oceanography, Vol 18, No 2, p 333-335, March 1973. 1 fig, 7 ref.

Descriptors: *Zooplankton, *Equipment, *Efficiencies, Plankton nets, Methodology, Construction, Water sampling, Filtration, Mortality, Thermal pollution, Cooling water.
Identifiers: *Filter-pump system *Quantitative sampling, Performance evaluation, Survival.

A conventional plankton net was inadequate for study of the survival of zooplankton passing through the cooling water systems of thermal power plants. A filter collection system was designed which allows survivals of 90-95 percent by reducing water velocities and turbulence within the collection chamber. The filter-pump system consisted of a specially designed filter connected to a Labawco type P general purpose centrifugal pump driven by an electric motor. Comparisons of fishing abilities did not show any significant differences between a filter pump and a plankton net. (Holoman-Battelle)

Identifiers: *Goldfish, *Carassius auratus, *Biomonitoring, Barium, Lithium, Silver, Tin.

The literature on the effects of pollutants on fish, particularly goldfish, in terms of lethal dosage and behavioral changes are reviewed. Results are presented of an experiment showing the effects of two very low concentrations of mercury on the behavior of goldfish. Twelve goldfish were conditioned to form different behavior patterns to obtain food (three fish to each pattern). After stabilization of these patterns, one fish from each pattern was placed in mercury polluted water at a concentration of 0.01 ppm, one in water polluted at 0.006 ppm, and the third in unpolluted water. All four fish placed in the more highly polluted water showed the largest drop in response rate. All but one of the fish placed in the lower-concentration polluted water showed greater decrease in response than those in the unpolluted water. The results suggest that the goldfish might be a potential pollution monitor. (Mortland-Battelle)

DDT IN SOME NEW ZEALAND MARINE AND FRESHWATER FAUNA,
Department of Agriculture, Wellington (New Zealand). Wallaceville Animal Research Center.
S. R. B. Solly, and D. L. Harrison.
New Zealand Journal of Marine and Freshwater Research, Vol 6, No 4, p 456-62, December 1972. 1 fig, 2 tab, 10 ref.

Descriptors: *DDT, *DDD, *DDE, *Polychlorinated biphenyls, *Gas chromatography, Freshwater fish, Marine fish, Crayfish, Mussels, Oysters, Absorption, *Marine animals, Eels, Rainbow trout.
Identifiers: Sample preparation, Biological samples, *Lindane, Detection limits, *New Zealand, Recovery, Anguilla australis schmidtii, Anguilla diefenbachii, Polyprion oxygeneois, Rhombosolea plebeia, Salmo gairdneri, Parapercis colias, Sardinops neopilchardus, Jasus edwardsii, Perna canaliculus, Ostrea lutaria, Macroinvertebrates, Blue cod, Flounder, Pilchard, Groper.

Ten species of fish, crustaceans, and mollusks, taken from inland and coastal waters of New Zealand in 1969-70, mostly before the legislative ban on DDT, were analyzed for residues of lindane, polychlorinated biphenyls (PCB), and DDT and its metabolites. Samples were macerated, extracted, and analyzed by gas chromatography. The detection limit was 0.01 ppm and recoveries were 82 percent for DDE, 78 percent for DDD, 78 percent for DDT, 78 percent for lindane, and 95 percent for PCB. DDE was the only organochlorine compound detected in six species, and DDE was the major residue in all others. DDD and/or DDT was present only in eels (Anguilla australis schmidtii, A. diefenbachii), groper (Polyprion oxygeneois), and some flounder (Rhombosolea plebeia). No lindane or PCB was found in any of the samples. The range of total DDT levels in edible flesh was 0-0.20 parts per million (on a fresh tissue basis) and the mean residue level for all specimens was 0.02 ppm. The incidence of residues appeared to be related to the regional use of DDT. (Little-Battelle)

OPTICAL PROPERTIES AND COLOR OF LAKE TAHOE AND CRATER LAKE,
Scripps Institution of Oceanography, La Jolla, Calif.
R. C. Smith, J. E. Tyler, and C. R. Goldman.
Limnology and Oceanography, Vol 18, No 2, p 189-199, March 1973. 11 fig, 1 tab, 26 ref.

Descriptors: *Optical properties, *Color, Depth, *Light penetration, *Solar radiation, Physical properties, Secchi disks, *Oregon, *California, Upwelling, Water quality, Aquatic habitats, Aquatic environment, Water properties.
Identifiers: *Lake Tahoe, *Crater Lake, Spectroradiometer, Spectral irradiance, Seasonal variation.

Spectral irradiance has been measured as a function of depth in Crater Lake, Oregon and Lake Tahoe, California. In Lake Tahoe, Secchi disk observations and submarine photometer measurements have been recorded year round since July 1967 and beam transmittance has been measured as a function of depth. From these data the radiant energy input and certain optical properties of the two lakes are presented. Since color is a principal esthetic feature of these lakes, a complete color analysis is also presented. This information provides an objective standard with which to compare possible future changes in the optical properties and in the esthetic appearance of Crater Lake and Lake Tahoe. The method can be applied generally to quantify the optical deterioration of any aquatic habitat and can detect such deterioration before it is noticeable by casual visual observation. (Holoman-Battelle)

THORIUM IN WATER AND ALGAE FROM THE ADRIATIC SEA,
Institut Rudjer-Boskovic, Rovinj (Yugoslavia). Center for Marine Research.
P. Strohal, and T. Pinter.
Limonology and Oceanography, Vol 18, No 2, p 250-253, March 1973. 2 tab, 20 ref.

Descriptors: *Sea water, *Chemical analysis, *Marine algae, *Neutron activation analysis, Heavy metals, Chlorophyta, Phaeophyta, Rhodophyta, Radiochemical analysis, Water analysis, Salinity, Methodology, Kelps, Radioactivity, Separation techniques, Radioactivity techniques.
Identifiers: *Thorium, *Adriatic Sea, Rare earth elements, Preconcentration, Pa-233, Sample preparation, Protactinium radioisotopes, Valonia utricularis, Cladophora pellucida, Codium dichotomum, Enteromorpha linza, Cystoseira barbata, Cytoseira abrotanifolia, Scytosiphon lomentaria, Padina pavonia, Halopteris scoparia, Calpomenia sinuosa, Dictyota dichotoma, Fucus virsoides, Ceramium rubrum, Vidalia volubilis, Rhodimenia palmeta.

Samples of seawater and algae collected along the coast of the Rovinj region in the North Adriatic were analyzed for the presence of thorium by neutron activation analysis (NAA). Thorium was preconcentrated by coprecipitation with Fe (OH)3, which was precipitated by the addition of FeC13 solution and NaOH to either filtered or unfiltered seawater. The samples were stirred well and Th separated from solution using Buchner vacuum filters or a centrifuge. The precipitate was dissolved in HC1, Fe removed by organic extraction, water phase evaporated, dried, irradiated and analyzed by NAA. Pa-233 radioactivities were measured in all samples and compared to standards. Samples of algae were measured, carefully separated, identified, and washed with seawater to remove impurities. The samples were slowly dried at 110 C, ignited at 450 C, reduced to constant weight, and analyzed by NAA as were the seawater samples. In filtered seawater, values were 0.8 pg Th/l and lower; for unfiltered seawater samples, values about three orders of magnitude higher were obtained. Thorium concentrations in marine algae are in the range of 1 to 0.01 microgram Th/g ashed material. (Holoman-Battelle)

THE PHYSIOGNOMY AND STRUCTURE OF THE BENTHIC MACROPHYTE COMMUNITIES ON ROCKY SHORES IN THE SOUTHWESTERN ARCHIPELAGO OF FINLAND (SEILI ISLANDS),
Turku Univ. (Finland) Dept. of Botany.
O. Ravanko.
Nova Hedwigia, Vol 23, Nos 2-3, p 363-404, 1972. 23 fig, 22 ref.

Descriptors: *Biomass, *Marine plants, *Biological communities, *Benthic flora, Marine algae, Cyanophyta, Chlorphyta, Phaeophyta, Rhodophyta, Marsh plants, Water sampling, Sago pondweed, Kelps, Ditch grass, Monocots.
Identifiers: *Finland, *Macrophytes, *Physiognomy, *Marine environment, Vegetation profiles, Spermatophytes, Charophyta, Chaetomorpha, Enteromorpha, Ulothrix, Lithoderma, Mytilus edulis, Horned pondweed, Water milfoil, Sea grasses, Widgeon grass.

The physiognomy and structure of the benthic macrophyte communities on rocky shores in the southwestern archipelago of Finland (Seili Islands) have been studied. Rows of 1 sq m quadrats were marked out along 23 lines, their vegetation was mapped and the macrophytes were then harvested. The species were determined and belts were named according to the dominant species. The fresh and dry weights and the ash content of the material were determined. The vegetation can mostly be divided into three main belts: the Cladophora, Fucus and Potamogeton belts. Besides differing in species composition these three belts also differ in biomass. For comparison, the water and ash contents of some individual species were determined. The ash contents differ greatly between the species. Some taxonomic problems and sources of error in the research methods are treated. The extent to which the vegetation of the study area is typical of the southwestern archipelago of Finland is discussed, and some of the results are compared with those from other areas. ANALYTICAL REVIEWS 1973/APPLICATIONS.

Analytical Chemistry, Vol 45, No 5, pIR-403R, April 1973. 13080 ref.

Descriptors: *Analytical techniques, *Chemical analysis, *Air pollution, *Water pollution, *Reviews, *Methodology, *Documentation, *Pollutant identification, *Instrumentation, *Pollutants, Organic compounds, Inorganic compounds, Physical properties, Laboratory tests, Reliability, Chemical properties, Rdioactivity techniques, Onsite investigations, Radiochemical analysis, Water analysis.
Identifiers: Sample preparation, Collaborative studies.

The following are reviewed articles concerned with analytical methods that may be applicable to environmental studies: (1) Air Pollution by Peter K. Mueller and Evaldo L. Kothny, (2) Essential Oils and Related Products by Ernest Guenther, Gilbertson, and Roman T. Koenig, (3) Fertilizers by Charles W. Gehrke, Larry L. Wall, Sr., and Paul R. Rexroad, (4) Pesticide Residues by Wayne Thornburg, (5) Petroleum by Richard W. King, (6) Pharmaceuticals and Related Drugs by David W. Cornish, Daniel M. Grossman, Allen L. Jacobs, Arthur F. Michaelis, and Ben Salsitz, (7) Water Analysis by Marvin J. Fishman and David E. Erdmann, and (8) Food by James A. Yeransian, Katherine G. Sloman, and Arthur K. Foltz. (Holoman-Battelle)

DETERMINATION OF URANIUM IN URINE SPECIMENS FOLLOWING THEIR SEPARATION THROUGH ANION EXCHANGE, (BESTIMMUNG DES URANS IN URINPROBEN NACH DESSEN ABTRENNUNG DURCH ANIONENAUSTAUSCH),
Vienna Univ. (Austria). Analytisches Institut.
J. Korkisch, and I. Steffan.
Mikrochimica Acta, p 273-278, March 1973. 2 tab, 4 ref.

Descriptors: *Urine, *Separation techniques, *Ion exchange, Heavy metals, Water analysis, Resins, Adsorption, Fluorometry.
Identifiers: *Uranium, Sample preparation, Detection limits.

A separation method that is generally applicable for uranium in the analysis of urine specimens is described. This is based on the adsorption of the uranium on the strongly basic anion exchanger Dowex 1, X8 from human urine that has been strongly acidified with hydrochloric acid, whereby most of the organic components, phosphoric acid and most mineral urine components are removed. Thus it becomes possible to separate the uranium compounds rapidly and simply without prior evaporation of the urine and destruction of the organic compounds. If need be, the foreign ions that are adsorbed along with the uranium, such as iron and also adsorbed urine coloring materials, are removed through subsequent washing of the resin with a mixture of 50 vol percent tetrahydrofurane, 40 vol percent methylglycol and 10 vol percent 6 N hydrochloric acid, and the uranium is eluted with 1 N hydrochloric acid. The determination of the uranium in the eluate can then be conducted without interference by the fluorometric method. (Little-Battelle)

DETERMINATION OF ALKYLBENZENESULFONATE (ABS) IN BOTTOM SEDIMENT,
Tokyo Metropolitan Univ., Tokyo. Dept. of Chemistry.
Y. Ambe.
Environmental Science and Technology, Vol 7, No 6, p 542-545, June 1973. 5 fig, 2 tab, 7 ref.

Descriptors: *Alkylbenzene sulfonates, *Bottom sediments, Lakes, Oceans, *Colorimetry, *Methodology, *Pollutant identification, Chemical analysis, Rivers, Water pollution, Separation, Techniques, Aquatic soils, Soil analysis, Mud, Solvent extractions, Detergents.
Identifiers: *Infrared spectrophotometry, Methylene blue active substance, Sample preparation, Chemical recovery, Dodecylbenzene sulfonate, Infrared spectra, Detection limits, Vertical distribution, Reproducibility, Lake Motosu, Lake Kizaki, Lake Aoki, Lake Shoji, Sagami Bay, Lake Suwa, Japan, Tokyo Bay, Absorbance.

A new method for the analysis of alkylbenzenesulfonate (ABS) in bottom sediments of a polluted river, a lake, and the sea was examined and the availability of the method was verified. Methylene blue active substance (MBAS) was extracted from dried mud sample with methanol benzene (1:1) mixture. After the solvent was completely evaporated, the residue was dissolved into distilled water and the concentration of MBAS was determined from the ratio of peak heights at wavenumber 1010/cm and at 890/cm of the infrared spectrum of MB-MBAS complex. Multiplying the value of MBAS by ABS/MBAS, the net content of ABS in the sediment was determined. Applying this method to the study of polluted lake sediments and marine sediments, some geochemical information on the process and rate of recent sedimentation in the lake and sea was obtained. SENSITIVITY AND DETECTABILITY LIMITS FOR ELEMENTAL ANALYSIS BY PROTON-INDUCED X-RAY FLUORESCENCE WITH A 3 MV VAN DE GRAAFF,
Los Alamos Scientific Lab., N. Mex.
C. J. Umbarger, R. C. Bearse, D. A. Close, and J. J. Malanify.
Available from the National Technical Information Service as LA-DC-72-1069. Report No. Conf-720801-2, 1972. 13 p, 4 fig, 1 tab, 13 ref.

Descriptors: *Heavy metals, *X-ray fluorescence, Titanium, Iron, Nickel, Copper, Gold, Lead.
Identifiers: *Sensitivity, *Detection limits, Proton-induced x-ray fluorescence, Proton accelerators, Vanadium, Germanium, Rubidium, Zirconium, Tin, Antimony, Cerium, Samarium, Dysprosium, Thulium, Tungsten, Bismuth, Thorium, Uranium, Silver.

Protons from a 3 MV Van de Graaff have been used to produce characteristic x-rays from 21 elements spanning the periodic table. The elements analyzed Ti, V, Fe, Ni, Cu, Ge, Rb, Zr, Ag, Sn, Sb, Ce, Sm, Dy, Tm, W, Au, Pb, Bi, Th, and U. Absolute K alpha and L alpha x-ray production cross sections have been determined, allowing one to calculate sensitivities for any given sample, detector geometry, and proton beam parameters. Elemental detectability limits are discussed assuming various backings and matrix materials. The large number of available small proton accelerators throughout the United States promises wide applicability of this technique to environmental and biomedical analysis. (Little-Battelle)

SIMULTANEOUS POLAROGRAPHIC DETERMINATION OF IRON (II) AND IRON (III) IN COAL MINE WASTE WATER,
Indiana Univ. of Pennsylvania. Dept. of Chemistry.
S. L. Tackett, and L. F. Wieserman.
Anal Lett. Vol 5, No 9, p 643-651. 1972. Illus.
Identifiers: Coal mine wastes, *Iron, *Mine waste water, *Polarographic determination, Waste waters.

Polarography with a sodium carbonate-oxalic acid supporting electrolyte was used to determine both Fe (II) and Fe (III) simultaneously in actual coal mine water samples. The average relative percent error was 2.2% for Fe (II) and 2.1% for Fe (III) over a range of 10-500 ppm. In actual mine water the Fe (II) content was highest where the mine water emerged. As the water moved down stream from the source of pollution Fe (II) decreased the Fe (III) concentration increased as Fe (II) was oxidized to Fe (III) by the O. This was accompanied by a decrease in pH. Further down the stream Fe (III) started to precipitate and then its concentration steadily decreased.--Copyright 1973, Biological Abstracts, Inc.

WATER QUALITY HYDROLOGY OF LANDS RECEIVING FARM ANIMAL WASTES,
Texas A and M Univ., College Station Water Resources Inst.
D. L. Reddell, G. G. Wise, R. E. Peters, and P. J. Lyerly.
Available from the National Technical Information Service as PB-222 181, $3.00 in paper copy, $1.45 in microfiche. Technical Report No 50, June 1973, 110 p, 23 fig, 26 tab, 61 ref. OWRR A-015-TEX (1), 14-31-0001-3844.

Descriptors: *Farm wastes, Waste disposal, Water pollution sources, Nitrates, Denitrification, *Feed lots, *Texas, *Water quality, *Soil disposal fields, Path of pollutants.
Identifiers: Bellvile (Tex), Pecos (Tex), and El Paso (Tex).

A significant pollution potential from cattle manure has developed as a result of the cattle feeding industry progressing to large, high density feeding operations. The objectives of this study were to determine the characteristics of storm runoff from a beef feedlot and to evaluate the disposal of large amounts of manure on land. Feedlot runoff was found to carry large amounts of chemical elements. The concentrations of chemical elements did not vary with size and intensity of rainstorm as much as by topographic differences of the watersheds. More ammonia was volatilized from high pH soil columns than neutral pH soil columns. A total nitrogen loss of 10 to 20 percent occurred in the soil columns. Up to 900 tons/acre of manure can be safely plowed under 30 to 36 inches deep without creating a surface water pollution problem. An increase of salts in the groundwater occurred during the first year and then salts were reduced to initial values the second year. No nitrate pollution of groundwater occurred. Crops can be effectively grown on land receiving up to 900 tons/acre of manure. Peak yields occur the second and third year after plowing under. (Runkles-Texas)

PREDICTION OF MIXING LENGTHS FOR RIVER FLOW GAGING,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
P. R. B. Ward.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY7, Paper 9856, p 1069-1081, July 1973. 5 fig, 1 tab, 18 ref, append.

Descriptors: *Mixing, *Discharge measurement, *Tracers, Dispersion, Sampling, Radioactivity techniques, Radioisotopes, Stream gages, Path of pollutants.

An analytical solution of the diffusion equation determines criteria for use in river flow gaging by the dilution method. The method allows the mixing length to be predicted from the channel geometry. The mixing length is the distance required for tracer from a point injection to become mixed across the cross section. The mixing length depends mainly upon the ratio of the square of the breadth of channel to the mean depth. The mixing length calculated by this method is compared with the injection point to sampling point distances in successful flow gagings by various workers. (Knapp-USGS)

TRITIUM AND DEUTERIUM CONTENT OF THE SNOW IN GROENLAND,
L. Merlivat, J. Ravoire, J. P. Vergnaud, and C. Lorius.
Earth and Planetary Science Letters, Vol 19, No 2, p 235-240, June 1973. 7 fig, 2 tab, 13 ref.

Descriptors: *Snow, *Firn, *Tritium, *Deuterium, *Snowfall, Regimen, Water balance, Tracers, Sampling, Radioactive dating, Stable isotopes.
Identifiers: *Greenland.

Deuterium and tritium measurements were made on firn samples taken along a central axis across Greenland. Accumulation values determined from tritium profiles decrease regularly from 54.7 cm of water per year on the west coast to 18.1 cm of water per year on the east coast. A correlation is demonstrated between the tritium deposition rate and the altitude of the precipitation collection site. (Knapp-USGS)

A TOPOLOGICALLY OPTIMUM RIVER SAMPLING PLAN FOR SOUTH CAROLINA,
South Carolina Univ., Columbia. Dept. of Geology.
W. E. Sharp.
Available from the National Technical Information Service as PB-222 278, $3.00 in paper copy, $1.45 in microfiche. Water Resources Research Institute, Clemson University, Clemson, S. C., Report No. 36, April 1973, 31 p, map, 5 fig, 4 tab, 9 ref. OWRR S-020-SC (1), A-026-SC (4).

Descriptors: *Water sampling, *Drainage patterns (Geologic), Monitoring, Water pollution sources, *South Carolina, Planning, Pollutant identification, Data collections.
Identifiers: *Edisto River (SC), Pee Dee River (SC), Santee River (SC), Savannah River (SC), *Topologically optimum plan, Sequential analysis.

A sequential river sampling plan has been developed which is independent of the shape of a drainage basin. Mathematical analysis indicates this sampling plan will be the optimum one in the search for a pollutant coming from a single source. The procedure consists of sequential sampling at successive centroids of the river basin such that only the contaminated portion is followed after each step. The site selection for all possible source locations need only be performed once using standard river basin maps. This selection has been performed for all river basins in South Carolina and the results are summarized on a composite drainage map of the State. The map shows that under ideal circumstances no more than 11 sequential samples would be needed to locate a unique pollution source on any of the rivers of South Carolina. Many practical problems require that a simultaneous sampling plan be used and for this purpose the necessary sampling sites can be selected quickly from among the sites already marked on the map as sequential sites. These sites are uniformly distributed and a 50% sequential coverage of the state is possible using a simultaneous plan of only 81 sites. These have been listed in order of priority and their locations are specified in terms of road numbers where highway bridges are closest to each site.

NUMERICAL THERMAL PLUME MODEL FOR VERTICAL OUTFALLS IN SHALLOW WATER,
Oregon State Univ., Corvallis. Dept. of Mechanical and Nuclear Engineering.
D. S. Trent, and J. R. Welty.
Copy available from GPO Sup Doc as EP1.23/2:73-162, $4.80; microfiche from NTIS as PB-221 488, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-162, March 1973. 486 p, 115 fig, 12 tab, 113 ref.

Descriptors: Waste disposal, *Turbulent flow, Jets, Temperature, *Thermal pollution, *Heated water, Forecasting, Model studies, *Outlets, Water pollution sources, Path of pollutants.
Identifiers: *Waste heat disposal.

A theoretical study of the heat and momentum transfer resulting from a flow of power plant condenser effluent discharged vertically to shallow, quiescent coastal receiving water is presented. The complete partial differential equations governing steady, incompressible, turbulent flow driven by both initial momentum and buoyancy are solved using finite-difference techniques to obtain temperature and velocity distributions in the near field of the thermal discharge. Turbulent quantities were treated through the use of Reynolds stresses with further simplification utilizing the concept of eddy diffusivities computed by Prandtl's mixing length theory. A Richardson number correlation was used to account for the effects of density gradients on the computed diffusivities. Results were obtained for over 100 cases, 66 of which are reported, using the computer program presented in this manuscript. These results ranged from cases of pure buoyancy to pure momentum and for receiving water depths from 1 to 80 discharge diameters deep. Various computed gross aspects of the flow were compared to published data and found to be in excellent agreement. Data for shallow water plumes and the ensuing lateral spread are not readily available; however, one computed surface temperature distribution was compared to proprietary data and found also to be in reasonable agreement. (EPA)

HERBICIDE CONTAMINATION OF SURFACE RUNOFF WATERS,
Utah State Univ., Logan. Dept. of Plant Science.
J. O. Evans, and D. R. Duseja.
Copy available from GPO Sup Doc as EP1.23/2 73-266, $1.25; microfiche from NTIS as PB-222 283, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-266, June 1973. 99 p, 14 fig, 22 tab, 62 ref. EPA Project 13030 FDJ.

Descriptors: *Herbicides, *Weed control, Water pollution sources, Persistence, Urea pesticides, Triazine pesticides, 2-4-D, 2-4-5-T, *Return flow, Path of pollutants, Water quality control.
Identifiers: *Herbicide runoff, *Picloram adsorption, Picloram leaching, Herbicide residues, Herbicide adsorption, Canal bank weed control, Diuron, Picloram.

Field and laboratory studies of the movement of herbicides were conducted to determine their potential as contaminants in irrigation return flow. Special emphasis was given to the use of herbicides for vegetation control along ditches, canals and watersheds where high dosages are required to control the excessive growth of grasses and broadleaved weeds. The following herbicides have been studied: substituted urea (diuron), triazines (summitol and atrazine), phenoxyacetic acid (2,4-D and 2,4,5-T) and a substituted pyridine (picloram). The greatest tendency for transport of herbicides in water coming in contact with soils occurs during the initial storms following spray application. If the intensity of the initial precipitation is not sufficient to cause movement across the soil, the danger of herbicide movement is essentially eliminated. The highest concentrations (ppm) of herbicide observed in surface waters were 1.8, 0.5, 4.2, 1.2 and 2.7 for diuron, summitol, 2,4-D, 2,4,5-T and picloram, respectively. These levels were observed immediately below treated areas receiving the higher recommended dosages of the herbicides. All herbicide concentrations dropped below the limit of detection within a few hundred meters below the sprayed areas. Presumably, soil filtration, adsorption and dilution are primarily responsible for the loss of herbicides from water. (EPA)

AN INVESTIGATION OF THE NITRATE PROBLEM IN RUNNELS COUNTY, TEXAS,
Texas Water Development Board, Austin; and Radian Corp., Austin, Tex.
D. C. Jones.
Copy available from GPO Sup Doc as EP1.23/2:73-267, $2.60; microfiche from NTIS as Pb-222 176, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-267, June 1973. 214 p, 22 fig, 10 tab, 43 ref. EPA Project 16060 HNI.

Descriptors: Groundwater, *Nitrates, Water pollution sources, *Stable isotopes, Soil contamination, Soil chemical properties, Soil leaching, *Remote sensing, Aerial photography, Aquifer characteristics, *Texas.
Identifiers: *Groundwater pollution, *Nitrogen isotope ratio, *Infrared photography, Groundwater age dating.

This report describes the investigation of the nitrate contamination in Runnels County, Texas. It was found that most water well contamination is due to naturally occurring nitrate. However, all the very high nitrate contamination problems (>1000 ppm) are principally due to nitrate from barnyards. The nitrate sources were confirmed utilizing the nitrogen isotope ratio technique. The nitrate contamination was caused by a rising water table which intersected and dissolved nitrate deposits from the soil. The rising water table was caused by a combination of low porosity aquifers, increased infiltration (decreased surface runoff) due to terracing, and several consecutive years of above normal rainfall. There appears to be no economical way to remove the nitrate from either the water or the soil. Recommendations for ways for the area residents to obtain potable water and for a continued monitoring program are included. (EPA)

GROUND WATER POLLUTION IN THE SOUTH CENTRAL STATES,
Robert S. Kerr Environmental Research Lab., Ada, Okla. National Ground Water Research Program.
M. R. Scalf, J. W. Keeley, and C. J. LaFevers.
Copy available from GPO Sup Doc as EP1.23/2:73-268, $2.35; microfiche from NTIS as PB-222 178, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-268, June 1973. 181 p, 23 fig, 15 tab, 385 ref. EPA Project No. 21 A10-03.

Descriptors: *Groundwater, *Water pollution sources, Water resources, Pollution, Oil fields, Brines, Pumping, *Reviews, Bibliographies, *Salinity, Water quality, *Brine disposal, *Waste disposal, Arkansas, Louisiana, New Mexico, Oklahoma, Texas.
Identifiers: *South-central US, Natural pollution.

A study was conducted to determine the groundwater pollution problems in the states of Arkansas, Louisiana, New Mexico, Oklahoma, and Texas. Information was obtained through review of the literature and through interviews with engineers, scientists, and governmental officials concerned with water pollution in the five states of the project area. Natural salinity was the greatest factor affecting the quality of ground water of the region. Disposal of oil-field brines was the most widespread source of man-made pollution. Other causes of groundwater pollution included poor well construction and abandonment procedures, over-pumping, irrigation return flows and land disposal of solid and liquid wastes. (EPA)

LEAD POLLUTION: RECORDS IN SOUTHERN CALIFORNIA COASTAL SEDIMENTS,
Scripps Institution of Oceanography, La Jolla, Calif.
T. J. Chow, K. W. Bruland, K. Bertine, A. Soutar, and M. Koide.
Science, Vol 181, No 4099, p 551-552, August 10, 1973. 2 fig, 8 ref. USAEC Grant AT (04-3)-34; NSF Grant GA-26301.

Descriptors: *Path of Pollutants, *Lead, *California, *Bottom sediments, Coastal plains, Heavy metals, Sedimentation, Sedimentation rates.

The present lead fluxes into sediments from the Santa Monica, San Pedro, and Santa Barbara basins of Southern California are, respectively, 0.9, 1.7, and 2.1 micrograms of lead per square centimeter of sea bottom per year; the natural (prepollution) rates for these three basins were, respectively, 0.24, 0.26, and 1.0 microgram of lead per square centimeter per year. Studies of isotopic composition indicate that lead pollutants in coastal sediments are derived mainly from the combustion of lead additives in gasoline. (Knapp-USGS)

LONG-LIVED POLLUTANTS IN SEDIMENTS FROM THE LAGUNA ATASCOSA NATIONAL WILDLIFE REFUGE, TEXAS,
Texas A and M Univ., College Station. Dept. of Geology.
W. M. Ahr.
Geological Society of America Bulletin, Vol 84, No 8, p 2511-2516, August 1973. 4 fig, 11 ref.

Descriptors: *Pesticides, *Path of pollutants, *Lagoons, *DDT, *Texas, Bottom sediments, Pesticide kinetics, Clays, Benthos, Persistence, Pesticide residues, Gulf of Mexico.

DDT and some heavy metals are long-lived pollutants which may be retained in sedimentary layers and may be relocated by postdepositional biological or mechanical processes. Because DDT has a half life of up to 17 yr and it is concentrated in higher ecological levels, even a few parts per billion in the sedimentary substrate can be harmful to wildlife. The Laguna Atascosa National Wildlife Refuge is surrounded by croplands that have been treated extensively with pesticides. Located on the flanks of the Rio Grande delta, the area has ponds, lakes, streams, and lagoons, all of which become settling basins for contaminated sediments. DDT is most abundant near the tops of the core samples and it may be enriched in subsurface clayey layers. Therefore, postdepositional processes have relocated the DDT into secondary host strata. The relocation is attributed to burrowing and mixing by crabs, worms, and other organisms. (Knapp-USGS)

HEAVY METALS IN THE ENVIRONMENT.
Proceedings of Seminar Conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, January 1973. 203 p. OWRR A-999-ORE (14).

Descriptors: *Heavy metals, *Water pollution sources, *Water pollution effects, *Public health, *Conferences, Environmental effects, Air pollution, Trace elements, Water chemistry, Chemical reactions, Toxicity, Hazards, Poisons, Ecology, Ecosystem, Food chains, Human pathology, Animal pathology, Biota.
Identifiers: *Symposium (Oregon State Univ), Pollution tolerance.

To examine pollution of the environment by metals, a seminar series was held at Oregon State University during fall quarter 1972. The seminars were open to the public, faculty, and students. Representatives of federal and state agencies were in attendance. The lectures are reproduced in this volume. The title and author of each paper presented are: Environmental Contamination by Toxic Metals, by D. R. Buhler; Heavy Metals in Estuaries and the Coastal Zone, by N. H. Cutshall; Arsenic and Cadmium in the Environment, by S. L. Wagner; Problems in the Analysis of Trace Metals, by R. H. Filby; Transport of Heavy Metals Through the Air Environment by S. K. Friedlander; Health Standards for Metals in Drinking Water, by R. G. Tardiff; Effect of Heavy Metals on Fish, by G. Chapman; Effects of Metals on Fertilization and Development in Fish, by J. D. McIntyre; The Role of Heavy Metals in Biology, by F. S. Kennedy; and Selenium in the Environment, by P. H. Weswig. (See W73-12605 thru W73-12614) (Woodard-USGS)

ENVIRONMENTAL CONTAMINATION BY TOXIC METALS,
Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
D. R. Buhler.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 1-35, January 1973. 1 fig, 7 tab, 23 ref.

Descriptors: *Heavy metals, *Environmental effects, *Toxicity, *Water pollution sources, *Public health, Air pollution, Ecology, Trace elements, Hazards, Poisons, Ecosystems, Food chains, Pathology.
Identifiers: *Pollution effects.

Concern over environmental pollution by heavy metals has developed because: (1) these elements are widely distributed throughout the environment; (2) they are not degraded and hence persist in nature for extended periods of time; (3) generally, they are toxic to living organisms at fairly low concentrations; (4) they tend to be either biologically magnified or cumulative in plants and animals; and (5) certain metals can be converted to more toxic forms in the environment. While contamination by toxic metals probably affects the entire biota, most attention has focused on the potential risk of metals to man. Metals thought to have adverse effects on human health are summarized. The most hazardous of these metals are arsenic, beryllium, cadmium, lead, mercury, nickel, and selenium. Regardless of the source, most metallic wastes eventually end up in surface and subsurface waters. Liquid wastes containing toxic metals are produced in many industrial operations. In addition to the direct discharge of such wastes, large quantities of many metals which are released into the atmosphere by industrial plants, incinerators, automobiles, etc., are eventually found as water pollutants after sedimentation or after precipitation from the air in rain or snow. (See also W73-12604) (Woodard-USGS)

HEAVY METALS IN ESTUARIES AND THE COASTAL ZONE,
Oregon State Univ., Corvallis. School of Oceanography.
N. H. Cutshall.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 37-44, January 1973. 1 fig, 1 tab, 13 ref.

Descriptors: *Water pollution sources, *Estuaries, *Heavy metals, *Coasts, *Path of pollutants, Pollution effects, Ecosystems, Ecology, Ecological distribution, Food chains, Trace elements, Bottom sediments, Biota.

Heavy metals normally occur at very low concentrations in coastal waters. Thus the addition of relatively small quantities of these elements to estuaries can potentially affect the concentrations. As an extreme example, the concentration of beryllium is only 6 x 10 to the minus 8th power grams per liter in seawater. This amounts to about half a cubic foot of the metal in the 200-mile-long Chesapeake Bay, the largest estuary in the United States. Low concentrations of heavy metals in solution are a result of their tendency for sorption on particulate matter including suspended sediment, bed sediment, and small organisms. In some cases, active removal of metals from the water by organisms may also contribute to lowered concentrations in the water. The transport and dilution of heavy metals in coastal systems is therefore affected by the movement of particulate matter as well as by the flow of water. The influence of initial sorption of metals upon their subsequent availability to organisms is one of the most significant problem areas in environmental research. Discussed is the effectiveness of sediments at detoxifying contaminated waters, and the conditions and the degree to which metals in sediments will become incorporated into the biosphere. TRANSPORT OF HEAVY METALS THROUGH THE AIR ENVIRONMENT,
California Inst. of Tech., Pasadena.
S. K. Friedlander.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 81-112, January 1973. 9 fig, 2 tab, 20 ref.

Descriptors: *Air pollution, *Heavy metals, *Chemical analysis, Chemical reactions, Atmosphere, Condensation, Evaporation, Coagulation, Sedimentation, Correlation analysis, Model studies, Aerosols, Particle size, Water pollution sources.

A method has been developed for calculating the number and chemical element size distributions of aerosols in a polluted atmosphere based on measured source characteristics and a chemical element balance for collected aerosol samples. The method assumes that: (1) no interaction occurs among primary aerosol emissions, (2) certain simplified models can be used to account for the conversion of secondary sources to the particulate phase, and (3) no modification of the primary emission size distributions occurs except through dilution and the secondary conversion processes. The method has been applied to the Pasadena aerosol and good agreement obtained with measured size and chemical element distributions. (See also W73-12604) (Woodard-USGS)

NUTRIENTS IN NEBRASKA'S WATERS,
Nebraska Univ., Lincoln. Dept. of Agronomy.
J. Muir, S. Boyce, E. C. Seim, and R. A. Olson.
Farm, Ranch and Home Quarterly, Summer 1973. 3 p, 2 fig. OWRR B-022-NEB (1). 14-31-0001-3908.

Descriptors: *Fertilizers, *Nutrients, *Nitrogen, *Phosphorus, Agricultural chemicals, *Nebraska.

A broad research program is determining the nutrient status and sources of nutrients in Nebraska waters with particular reference to agriculture's role, especially fertilizer use. Basic objectives are to investigate movement of N and P below the root zone under different agricultural management systems. Surface and rain waters also are surveyed relative to these nutrients. Essentially no change in P concentration of groundwater occurred in the 1961-72 period. This is not surprising since even soluble P compounds in fertilizers are rapidly rendered immobile in the soil. Studies indicate that the nutrient content of the groundwater is predominantly related to irrigation and water table depth. In effect, the more irrigation development and the shallower the water table, the greater the nutrient content, accentuated further if soils in the area are largely of sandy texture. Of significant but somewhat lesser import is the magnitude of fertilizer use and of cattle density, with essentially no impact of human density.

Descriptors: *Biodegradation, *Marine bacteria, *Oxidation, Oil spills, Oil, Organic compounds, Gas chromatography, Classification, Microbial degradation.

Identifiers: *Crude oil, Substrate utilization, Paraffins, Normal paraffins, Isoparaffins, Aromatic hydrocarbons, Cycloparaffins, Chromatograms, Decalin, Tetralin, 1 3 5-triethylbenzene, Tridecane, 1 3 5-triisoproplybenzene, Bicyclohexyl, Heptylcyclohexane, Farasane, Tetradecane, 2-Ethylnaphthalene, Pentadecane, 1 2-Dimethylnaphthalene, Acenaphthene, Hexadecane, 2 3 6-Trimethylnaphthalene, Flourene, Pristane, Octadecane, Anthracene, Eicosane, Fluoranthene, Pyrene, Tetracosane, Pentacosane, Hexacosane, Squalane, Octacosane, Triasontane.

Several strains of bacteria, isolated from marine environments, were characterized by gas chromatography for their hydrocarbon oxidizing abilities using a complex synthetic mixture of hydrocarbons. Attempts were made at a broad classification of these organisms on the basis of their behavior towards four major groups of hydrocarbons, normal paraffins, iso-paraffins, cyclo-paraffins, and aromatics, known to be present in crude oils. Although bacteria appear to be able to oxidize hydrocarbons at random, this study has shown that it may be possible to recognize a rudimental pattern if their oxidative abilities are viewed in terms of groups of hydrocarbons rather than individual compounds. The action of combined strains on the synthetic hydrocarbon mixture was studied. No particular benefit could be derived as compared to the use of single strains. (Little-Battelle)

PREPARATION AND PROPERTIES OF 3--TRIFLUOROMETHYL-4-AMINOPHENOL,
Medical College of Wisconsin, Milwaukee. Dept. of Pharmacology.
J. J. Lech.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 461-463, March 1973. 2 fig, 2 tab, 3 ref.

Descriptors: *Physiochemical properties, *Methodology, Larvicides, *Phenolic pesticides, Gas chromatography, Halogenated pesticides, Organic compounds, Phenols, Spectrophotometry.
Identifiers: :±Trifluoromethyl-4-aminophenol, Preparation (Chemical), Dissociation constants, Infrared spectra, Metabolites, Ultraviolet spectra, Chemical composition, Thin layer chromatography, Ultraviolet spectrophotometry, pK, Electron capture gas chromatography, 3-Trifluoromethyl-4-nitrophenol.

A method is described for the preparation of 3-trifluoromethyl-4-aminophenol (RTFM), metabolite of 3-trifluoromethyl-4-nitrophenol (TFM), a selective larvicidal agent used to control the sea lamprey (Petromyzon marinus) in the upper Great Lakes. Some of its physical-chemical properties, including infrared spectrum pK sub a, and gas chromatography, were examined which may aid in the design of analytical procedures for metabolite residues. Generally, the metabolite is prepared from the parent compound by reduction with hydrogen by: (1) dissolving TFM in absolute ethanol to which was added 5 percent palladium on charcoal, (2) reducing the chemical in a Parr apparatus at 60 psi H2, (3) filtering to remove the catalyst, and bubbling HC1 gas through the mixture in an ice bath, and (4) collecting the precipitate by vacuum filtration and washing with ice-cold acetone. The resulting material dried under vacuum and stored under nitrogen is a white fluffy powder which decomposed at 210-220C. Elemental analysis indicated that this material contained 39.19 percent C, 26.95 percent F, and 3.28 percent H. (Holoman-Battelle)

THE EFFECT OF ADSORBENTS ON THE RATE OF DEGRADATION OF HERBICIDES INCUBATED WITH SOIL,
Saskatchewan Univ., Saskatoon. Dept. of Soil Science.
J. R. Moyer, R. J. Hance, and C. E. McKone.
Soil Biol Biochem. Vol 4, No 3, p 307-311. 1972.
Identifiers: *Adsorbents, *Degradation rate (Herbicides), *Herbicides, Incubation, *Soils.

The rate of disappearance was followed of atrazine, chlorthiamid and linuron when incubated at 20C with soil and soil containing added charcoal or clay. The presence of clay slightly increased (7.5-38%) the persistence of all compounds, whereas charcoal although increasing the persistence of atrazine and chlorthiamid several fold did not significantly affect that of linuron. Charcoal reduced decomposition rates less than it reduced herbicide concentration in the soil solution.--Copyright 1973, Biological Abstracts, Inc.

THE KINETICS OF MICROBIOLOGICAL MODIFICATION OF ORGANIC SUBSTANCES IN NATURAL WATERS,
Alaska Univ., College. Inst. of Marine Science.
D. K. Button.
Alaska Institute of Water Resources Report No. 11, December 1972. 9 p, 1 tab, append. OWRR A-023-ALAS (1).

Descriptors: *Metabolism, *Microorganisms, *Water chemistry, *Decomposing organic matter, Hydrogen ion concentration, Nutrients, Kinetics, Organic matter, Biochemistry, Absorption, Water purification.
Identifiers: Nutrient removal.

The threshold quantity above which the process of the metabolizing of foreign chemicals in water can occur is set by the facility with which the cellular membranes involved can concentrate the material in question. This process is accomplished by diffusion accompanied by a set of transport systems which recognize a particular species and carry it across the cell wall where it is chemically modified. Since microbial decomposition is a major route or organic material decomposition and the reason dissolved organics do not accumulate, understanding this process is basic to understanding water chemistry. Research yielded several broad generalizations, the most important of which are that substances in small quantities such as vitamins are effectively removed; sediments (clay and glacial flour) do not appreciably affect dissolved nutrient availability; and nutrient removal can be fairly well predicted by a simple, empirically derived equation, justified on the basis of bimolecular collision frequency in liquids. Also, a consistent and unusual response of transport to pH was found. It is the efficiency of this transport system that sets the levels of dissolved metabolites that are kinetically important. A shift of 2 pH units can shut off this process showing that pH is a more important variable than heretofore realized. (Jones-Wisconsin)

THE EFFECT OF LONGITUDINAL DISPERSION ON THE DEOXYGENATION RATE IN POLLUTED STREAMS,
Hydraulic Research Inst., Prague (Czechoslovakia). Surface Water Quality Div.
A. Nejedly.
Journal Water Pollution Control Federation, Vol 45, No 7, p 1601-1605, July 1973. 3 fig, 2 tab, 7 ref.

Descriptors: *Dispersion, *Oxygen sag, *Path of pollutants, Dissolved oxygen, Waste assimilative capacity.
Identifiers: Deoxygenation.

The ratios between stream and laboratory values of the deoxygenation coefficient in two polluted streams were compared with the respective values of the coefficient of longitudinal dispersion as determined by tracer tests. Stream values are consistently higher than laboratory values, and the ratio between stream and laboratory values of the deoxygenation coefficient at the same temperature is directly proportional to the coefficient of longitudinal dispersion. The general form of the relationship between the ratio of the stream value of the deoxygenation coefficient at an arbitrary temperature versus its laboratory value at 20 deg C and the value of the coefficient of longitudinal dispersion was established and formulated. MINERAL POLLUTION IN THE COLORADO RIVER BASIN,
Environmental Protection Agency, Phoenix, Ariz. Colorado River Basin Water Quality Control Project.
W. C. Blackman, Jr., J. V. Rouse, G. R. Schillinger, and W. H. Shafer, Jr.
Journal Water Pollution Control Federation, Vol 45, No 7, p 1517-1557, July 1973. 24 fig, 14 tab, 19 ref.

Descriptors: *Salinity, *Water pollution sources, *Colorado River, Irrigation water, Leaching, Salts, Runoff, Chlorides, Bicarbonates.

Concentrations of total dissolved solids (salinity) in Colorado River basin streams are a major problem for lower basin water users. Salinity concentrations in unregulated streams of the basin comprise two distinct populations that are grouped into base flow months and runoff months. Statistically significant increases in salinity have occurred with increasing water use, and in downstream progression. Upper basin salt load contributions are: runoff, 52 percent; irrigated agriculture, 37 percent; natural point sources and flowing wells, 9 percent; and municipal and industrial, 7 percent. Lower basin contributors are: upper basin inflow, 72 percent; natural point sources, 15 percent; irrigated agriculture, 9 percent; runoff, 4 percent, and municipal and industrial, less than 1 percent. Salt yields from irrigated lands range from near 0 to 8.5 tons/yr/acre. Greatest yields are from irrigation of and runoff from lands underlain by Mancos shale and Tertiary lake beds. Headwater areas yield predominantly calcium bicarbonate waters. Saline sediments in lower valleys cause waters to become predominantly high in sodium calcium sulfate ions. (Knapp-USGS)

FACTORS AFFECTING THE PERCOLATION TEST,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
K. A. Healy, and R. Laak.
Journal Water Pollution Control Federation, Vol 45, No 7, p 1508-1516, July 1973. 10 fig, 2 tab, 5 ref.

Descriptors: *Infiltration, *Percolation, *Septic tanks, Soil disposal fields.
Identifiers: *Percolation tests.

A mathematical analysis of the percolation test is presented with both capillary and gravity flow potentials considered. A relation between percolation rate, capillarity, hole shape, and permeability is developed. Laboratory percolation tests qualitatively support the analysis. Field percolation tests show no correlation between percolation rate, permeability, or position of the water table. The percolation test seems to be an unreliable method of determining the water absorption capability of a soil deposit. (Knapp-USGS)

LIPIDS IN SHALLOW BOTTOM SEDIMENTS,
Harvard Univ., Cambridge, Mass. Dept. of Chemistry.
D. G. Shaw.
Environmental Science and Technology, Vol 7, No 8, p 740-742, August 1973. 1 fig, 8 ref.

Descriptors: *Bottom sediments, *Estuaries, *Massachusetts, *Lipids, Harbors, Organic compounds, Oil wastes, Oil spills, Path of pollutants, Water pollution sources, Adsorption, Waste water (Pollution), Sewage sludge, Distribution patterns.
Identifiers: *Boston Harbor.

Sediments from the bottom of Boston Harbor and vicinity were analyzed for lipids by gas chromatography. A petroleum-like fraction was associated with sewage sludge dumped into the harbor and with bottom deposits of similar sludge-like mud. However, samples of silt and clay collected in adjacent areas showed no evidence of petroleum at comparable concentrations. The difference in lipid content of the various sediments reflects the complexity of estuarine sedimentation processes and are absorption of organic materials onto sediments. (Knapp-USGS)

PROBLEMS OF GROUNDWATER POLLUTION BY BRINE,
Public Health Service, Dallas, Tex. Region VII.
J. W. Keeley.
Public Works, Vol 97, No 3, p 149, 158, 160, 162, March 1966.

Descriptors: *Water pollution sources, Pollution, Wells, *Waste water disposal, *Brine disposal, Aquifers, Oil wells, Injection wells.
Identifiers: Well sealing, Cementing, *Surface pits.

Numerous complaints have been registered concerning salt water pollution in rural water wells, and there is growing concern for the protection of major aquifers from which municipal water supplies are drawn. Described is the development of procedures which can be extended from an area of investigation to the entire problem area by interested parties. These procedures help to determine methods by which brine pollution sources and polluted water sources can be located, point out threatened fresh water sources that need protection, find ways to properly seal old and new wells, and present information and advice upon which state agencies can prepare necessary legislation for the prevention of brine pollution. BIOLOGICALLY ACTIVE COMPOUNDS IN THE AQUATIC ENVIRONMENT: THE UPTAKE AND DISTRIBUTION OF (1,1-DICHLORO-2-,2-BIS (P-CHLOROPHENYL) ETHYLENE), DDE BY CHIRONOMUS TENTANS FABRICIUS (DIPTERA: CHIRONOMIDAE),
Michigan State Univ., East Lansing. Dept. of Entomology.
S. K. Derr, and M. J. Zabik.
Trans Am Fish Soc. Vol 101, No 2, p 323-329. 1972. Illus.
Identifiers: Aquatic enviroment, *Chironomidae, Chironomus-Tentans, *DDE, Diptera, Distribution patterns, *Midges.

The midge, C. tentans was exposed from egg through adult to varying concentrations (.07-2.2 ppb) of (1,1-dichloro-2,2-bis (P-chlorophenyl) ethylene), DDE. The amount of DDE accumulated by the midge was determined by gas-liquid chromatography. The accumulation of DDE from aqueous solution and contaminated substrate by the midge as a function of DDE concentration and exposure time was determined, and the distribution of the accumulated DDE residue was quantitated (pupa, exuvia, adult and egg mass). No attempt was made to differentiate between these 2 modes of uptake (water or substrate). The DDE accumulation by the midge demonstrated a dose-dependent relationship, accumulating DDE exponentially with increased concentration at a given exposure time. At any given concentration of DDE in the water, accumulation increased with increased exposure time. On a ppm basis the midges concentrated DDE approximately 20,000 times over that level which was present in the water. The exuvia did not demonstrate a major route of residue elimination as only 1.4 to 4.9% of the pupal burden was lost via the exuviae. The process of egg deposition eliminated 11.6 to 30.9% of the adult female burden of DDE residue.--Copyright 1973, Biological Abstracts, Inc.

FLOW OF MICROBIALLY FIXED NITROGEN IN A MODEL ECOSYSTEM,
Oak Ridge National Lab., Tenn.
S. A. Visser, M. Witkamp, and R. C. Dahlman.
Plant and Soil, Vol 38, No 1, p 1-8, February 1973. 3 fig, 1 tab, 6 ref.

Descriptors: *Nitrogen fixation, *Azotobacter, *Nitrogen fixing bacteria, *Path of pollutants, Nitrification, Ecosystems, Mass spectrometry, Computer models, Cycling nutrients, Nitrogen, Aquatic plants, Cultures, Kaolinite, Centrifugation, Incubation, Clays, Anaerobic conditions, Nitrogen cycle, Radioactivity techniques.
Identifiers: Fate of pollutants, Culturing techniques, Acidification, Duckweed, Kjeldahl procedure, Nitrogen radioisotopes, Azotobacter chroococcum, Culture media.

Transfer of atmospheric nitrogen through microbial fixers, a green plant, decomposer microflora, water and soil was measured in model ecosystems. The systems were maintained under controlled conditions in a 50-ml respirometer flask and consisted of 10 g of kaolinite, 10 ml of water, 60 duckweed leaves (Lemna minor), and a mixed microflora or pure Azotobacter chroococcum. The role of the Azotobacter in fixation was assessed by comparing the nitrogen flow in systems with nitrogen fixers only and those with both nitrogen fixers and decomposers. Analog computer simulations were used to compare N-15 transfer from the atmosphere with net changes of all nitrogen in all compartments. Results showed that Azotobacter and the mixed flora with Azotobacter are about equally capable of fixing atmospheric nitrogen. During subsequent transfer of the nitrogen there was a distinct differentiation between movement of the newly fixed nitrogen and the nitrogen that was already present in tissues introduced in the beginning of the experiment. Pathways and transfer coefficients of both N-14 and N-15 were different in the presence of the different microbial populations. Turnover was more complex and in general slower in the presence of a mixed population than with pure Azotobacter. Denitrification losses upon adicification were negligible for N-14 but appreciable for N-15. (Mortland-Battelle)

NITROGEN RELEASE FROM LAKE SEDIMENTS,
Wisconsin Univ., Madison. Water Chemistry Program.
E. R. Austin, and G. F. Lee.
Journal Water Pollution Control Federation, Vol 45, No 5, p 870-879, May 1973. 7 fig, 4 tab, 10 ref.

Descriptors: *Lake sediments, *Nitrogen, *Nitrogen compounds, Anaerobic conditions, Aerobic conditions, Mixing, Shallow water, Deep water, Laboratory tests, *Wisconsin, Nitrates, Nitrites, Trophic level, Oligotrophy, Mesotrophy, Bottom sampling, Bottom sediments, Ammonia.
Identifiers: *Lake Mendota, *Lake Trout, *Nitrogen release, Chemical composition, Kjeldahl nitrogen, Ammonium, Ekman dredge, Organic nitrogen.

A study was made of the release of nitrogen compounds from two Wisconsin lakes sediments that were completely mixed with the water at all times. Ekman dredge sediment samples were taken from the shallow (5 m) and deep (22 m) areas of Lake Mendota, and the deeper areas (27-32 m) of Lake Trout. Under aerobic conditions, over 49 percent of the total nitrogen present in one sample was released as soluble organic nitrogen, ammonia, and nitrate in approximately 200 days. Under anaerobic conditions, these sediments released about 6 percent of the nitrogen in a similar period of time. Sediments from the second lake released 5 and 2 percent, respectively, of the potentially released nitrogen in 100 days under aerobic and unaerobic conditions. Similar tests conducted on unstirred sediments showed that the amount of mixing was probably one of the controlling factors of nitrogen release. (Holoman-Battelle)

LITHIUM SILICATE SEDIMENTATION TRACER FOR SHOAL DEPOSIT STUDIES,
IIT Research Inst., Chicago, Ill.
T. K. Nedved, E. G. Fochtman, W. M. Langdon, and F. O. Sullivan.
Journal Water Pollution Control Federation, Vol 45, No 5, p 896-904, May 1973. 8 fig, 1 tab, 1 ref.

Descriptors: *Tracers, *Shoals, *Sedimentation, Suspended solids, Distribution patterns, Tracking techniques, *Path of pollutants, Sedimentation rates, Sediments, Water pollution effects, Water pollution sources, Sampling, Density, Rivers, Dispersion, *Illinois, Industrial wastes, Radioactivity techniques, On-site tests, Organic matter, Iron oxide.
Identifiers: Lithium silicate, *Calumet River (Ill.), Proton capture technique, Settleable solids, Acid insoluble material.

Investigations were conducted on a 12-mile section of the Calumet River to determine the relationships between the suspended solids discharges by outfalls and the buildup of shoals in a waterway. Shoal soundings were used to determine the long-term overall rate of shoal buildup, as well as the volume and distribution of the shoal material in a selected study area. The data indicated an average rate of shoal buildup of 0.19 ft/ month. The shoals were sampled extensively to determine the physical and chemical properties of the deposited materials. The wet density of the shoals in the area averaged 87 lb/cu ft. The ss concentration of the river in the immediate vicinity of the study outfall indicated rapid disperison of the materials discharged. These surveys further demonstrated the extreme complexities of the processes involved in shoal buildups in this particular area. Techniques were developed for quantitative tracing of the contribution of a particular discharge to the formation of shoals. Lithium metasilicate was used as the tracer material. A proton-capture technique was used to assay for the lithium. Special pan type sedimentation samplers were designed, constructed, and used in a field demonstration study. This investigation indicated that the suspended matter discharged by

the study outfall traveled considerably in both the upstream and downstream directions. Although only 30 percent of the tracer material was recovered, this study amply demonstrated that lithium metasilicate could be used successfully as a sedimentation tracer. (Little-Battelle)

STREAM-VELOCITY EFFECTS ON THE HEAVY-METAL CONCENTRATIONS,
Alabama Univ., University. Dept. of Biology.
L. G. Williams, J. C. Joyce, and J. T. Monk, Jr.
Journal of the American Water Works Association, Vol 65, No 4, p 275-279, April 1973. 3 fig, 2 tab, 8 ref.

Descriptors: *Heavy metals, *Suspended solids, *Toxicity, *Biological communities, Cadmium, Chromium, Copper, Mercury, Manganese, Zinc, Iron, Runoff, Scour, Sampling, Water analysis, Industrial wastes, Flow rates, Sediments, Suspension, Water pollution effects, Fish Zooplankton, Phytoplankton, Organic matter, Flocculation, Separation techniques, Path of pollutants, Bacteria, Alabama.
Identifiers: *Atomic absorption spectrophotometry, Transport, Black Warrior River, Sample preparation, Resuspension.

Water samples were collected twice weekly in two 20-liter polyethylene jugs from the Black Warrior River and three of its tributaries from February 17 to October 6, 1971. One sample was flocculated by the addition of aluminum ammonium sulfate to remove suspended matter; suspended matter from the other was concentrated by siphoning the sample through a 60 millimicron screen and settling. Samples were digested and analyzed for Cd, Cr, Cu, Hg, Mn, Zn, and Fe by atomic absorption spectrophotometry. River flow rates were also monitored. No correlation was found to exist between streamflow and the soluble concentrations of the selected heavy metals. However, a strong positive correlation did exist between the concentration of these metals and the resuspended bottom sediments, mostly in the form of ooze deposits, present in the water column following increased flow and scour from heavy rain runoff. Copper, iron, manganese, mercury, and zinc concentrations were associated with oooze sediments that accumulated during periods of low or negligible streamflow and were resuspended into the water column following scours in a complex that was destructive to favorable balance of river biota and produced slugs of water unfit for good domestic supply. Suspended particles larger than 60 millimicrons that were screened from the water samples were mostly organic and held the highest concentrations of the selected metals, whereas inorganic large particles had relatively low carrying power. INSECTICIDE RESIDUES IN WATER AND SEDIMENT FROM CISTERNS ON THE U.S. AND BRITISH VIRGIN ISLANDS - 1970,
Central Michigan Univ., Mount Pleasant. Dept. of Biology.
H. Lenon, L. Curry, A. Miller, and D. Patulski.
Pesticides Monitoring Journal, Vol 6, No 3, p 188-193, December 1972. 5 fig, 5 tab, 6 ref.

Descriptors: *Water analysis, *Sediments, *Cisterns, *Gas chromatography, DDT, DDD, DDE, Dieldrin, Sampling, Separation techniques, *Pesticide residues, *Insecticides.
Identifiers: *Virgin Islands, Malathion, Sample preparation, Electron capture gas chromatography.

Samples of water and sediment were collected from cisterns in four of the Virgin Islands during February and March, 1970, to be analyzed for pesticides. Water samples were collected in glass bottles, extracted by liquid-liquid partitioning with purified petroleum ether, partially evaporated, sealed in vials, and mailed to Michigan for analysis. Before analysis samples were dried with anhydrous sodium sulfate, partially evaporated and adjusted to 25 ml. Sediment samples were collected with a plankton net and mailed in screw-capped bottles. These were filtered the filter containing the sediment dried and the sediment extracted with petroleum ether. Sediment extracts were prepared the same as water extracts. All samples were analyzed for DDE, DDD, DDT, dieldrin, and malathion by electron capture gas chromatography. Evidence of an unknown malathion metabolite was found in all 49 water samples analyzed, whereas malathion was found in only two (0.01 and 0.14 ppb). DDT, its metabolites, and dieldrin were not commonly found in the water samples except those from St. John where dieldrin was detected in approximately 50 percent of the samples (average concentration-0.19 ppb). Sediment samples from cisterns, in general, contained much higher concentrations of pesticides than water, with DDT and its metabolites occurring most frequently. In many of these sediment samples, the residue levels were high enough to be of concern. As a result it is strongly recommended that cisterns be cleaned frequently to remove sediment. (Little-Battelle)

ANNUAL LIFE CYCLE AND PRODUCTION OF THE CHAETOGNATH SAGITTA ELEGANS IN BEDFORD BASIN, NOVA SCOTIA,
Bedford Inst., Dartmouth (Nova Scotia).
D. D. Sameoto.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 333-344, March 1973. 7 fig, 6 tab, 7 ref.

Descriptors: *Secondary productivity, *Zooplankton, *Life cycles, *Biomass, *Canada, Growth rates, Energy budget, Growth stages, Annual turnover, Animal growth, Water temperature, Sampling, Copepods, Least squares methods, Regression analysis, Invertebrates.
Identifiers: *Chaetognaths, Sagitta elegans, *Bedford Basin (N.S.), Eggs, Food sources, Correlation coefficients, St. Margaret's Bay.

A study has been made on the population of Sagitta elegans in Bedford Basin for which comparable data on the basic production system are available (Sameoto, 1971). Horizontal and oblique samples of zooplankton were taken after dark at five stations inside and two stations outside the Basin. The samples were analyzed within a week of collection. S. elegans over 5 mm long were removed, counted, and weighed after blotting on filter paper. The remaining sample was split and the stages of S. elegans less than 5 mm were counted. Free water was removed from the sample of copepods obtained upon sorting and the sample weighed to obtain a biomass estimate. The method used to stage the animals and analyze the different modes of the S. elegans population was that used by Sameoto (1971). In Bedford Basin, Nova Scotia, Sagitta elegans has two main generations per year, one in the spring and one in the fall. The biomass of S. elegans per 100 cu m of water was an order of magnitude greater in the Basin than that reported previously for St. Margaret's Bay, N.S. The growth rate and the number of degree days needed to mature were similar to those found for S. elegans in St. Margaret's Bay. Annual turnover rate for S. elegans in the Basin was 5.6 and yearly production was estimated at 27.0 kcal per year or 9.0 percent of the yearly copepod production. It was calculated that the species used 90.4 kcal per sq m per year in respiration. The percentage of the total yearly production of copepods consumed by S. elegans was estimated at 36 percent. THE CHARACTERIZATION OF SOLUBLE PHOSPHORUS RELEASED BY LIMNETIC ZOOPLANKTON,
Toronto Univ. (Ontario). Dept. of Zoology.
R. Peters, and D. Lean.
Limnology and Oceanography, Vol 18, No 2, p 270-279, March 1973. 6 fig, 3 tab.17 ref.

Descriptors: *Phosphorus, *Zooplankton, *Pollutant identification, *Radiochemical analysis, Phosphates, Waterfleas, Copepods, Radioactivity techniques, Cycling nutrients, Phosphorus radioisotopes, Anion exchange, Seston, Absorption, Solubility.
Identifiers: Characterization, Orthophosphates, Nutrient availability, Diaptomus minutus, Daphnia rosea, P-32, Gel filtration chromatography, Molybdates, Phosphorus cycle.

Three rapid techniques were used to characterize the main forms of soluble phosphate released by Daphnia rosea. Uniformly P-32-labeled laboratory animals were transferred to nonradioactive water and most of the soluble radiophosphorus was shown to be similar to PO4 in anion exchange, in gel filtration chromatography, and in a kinetic analysis of incorporation by natural seston. In addition, Diaptomus minutus was labeled in situ with P-32 and its release products compared to PO4 by gel filtration. This analysis and those using Daphnia indicated that the released soluble phosphorus was about 90 percent orthophosphate. However, molybdate analyses of the soluble phosphates released in a 10-hr experiment showed them to be only 60 percent orthophosphate. Net reuptake of orthophosphate was insufficient to account for this discrepancy. Recycling of phosphorus is postualted in longer experiments, which leads to a substantial underestimate of the orthophosphate release. (Holoman-Battelle)

ANNUAL PRODUCTION OF A STREAM MAYFLY POPULATION: A COMPARISON OF METHODS,
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
T. F. Waters, and G. W. Crawford.
Limnology and Oceanography, Vol 18, No 2, p 286-296, March 1973. 6 fig, 5 tab, 31 ref.

Descriptors: *Mayflies, *Standing crops, *Secondary productivity, *Animal growth, *Methodology, Growth rates, Bottom sampling, Aquatic in-

sects, Annual, Life history studies, Annual turnover, *Minnesota.
Identifiers: *Comparative studies, Removal summation method, Instantaneous growth method, Allen curve method, Hynes method, Method evaluation, Data interpretation, Ephemerella subvaria.

The annual production of the mayfly Ephemerella subvaria McDunnough in a small central Minnesota stream, Luxembury Creek, was estimated by four methods: a removal-summation method, the instantaneous growth method, the Allen curve, and the Hynes method. Basic data on standing crop and growth rates were obtained from a series of bottom samples covering the life cycle of the mayfly. The life history of E. subvaria was clear and simple, and the data were particularly amenable to production estimation by all four methods. The first three yielded estimates of annual production that generally agreed, ranging from 26.4 to 28.9 g/sq m. The Hynes method yielded an estimate 15.2 to 26.1 percent higher, or 33.3 g/sq m. Cohort turnover ratios for the first three methods ranged from 4.2 to 4.6 (not calcuable for the Hynes method); the annual turnover ratio for the first three methods ranged from 5.8 to 6.3 and was 7.2 for the Hynes method. (Mortland-Battelle)

BACTERIAL CONTENT OF PARTICULATE MATTER IN OFFSHORE SURFACE WATERS,
Woods Hole Oceanographic Institution, Mass.
H. W. Jannasch.
Limnology and Oceanography, Vol 18, No 2, p 340-342, March 1973. 1 tab, 7 ref.

Descriptors: *Sea water, *Organic matter, *Marine bacteria, Surface waters, Carbon, Cultures, Filtration, Water sampling, Methodology.
Identifiers: *Sargasso Sea, *Particulate matter, Heterotrophic bacteria, Culturing techniques, Sample preparation.

During a cruise in the Sargasso Sea, flakelike particles swirling up with the surface waves motion were encountered. These particles showed intense iridescence and it required more than an hour at a speed of 11-12 knots to sail out of them. Because the particles would disintegrate with only slight disturbance of the water, they were very difficult to sample. Methods were devised to obtain small samples of small size particles. Subsamples were shaken vigorously, streaked on agar plates, membrane filtered, and incubated on the same agar medium at 22 plus or minus 1 C for 4 days. The data taken from these cultures indicated the absence of attached bacteria and made it appear unlikely that the particulate material was inhibitory to bacterial growth or attachment. This was interpreted as an indication that the particles were of relatively recent origin and in a labile state. (Mortland-Battelle)

MERCURY DISTRIBUTION IN ESTUARINE--NEARSHORE ENVIRONMENT,
Skidaway Inst. of Oceanography, Savannah, Ga.
H. L. Windom.
Journal of the Waterways Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 99, No WW2, p 257-265, May 1973. 5 fig, 2 tab, 6 ref.

Descriptors: *Estuarine environment, *Mercury, *Path of pollutants, Estuaries, Rivers, Bottom sediments, Plant tissues, Plankton, Water pollution, Salt marshes, Heavy metals, Coastal marshes, Marsh plants, Distribution, Pollutants, Water sampling, Bottom sampling, Absorption, Chemical analysis, Salinity, Water analysis, Suspended sediments, Sedimentation, Rhizomes, Root systems, Leaves.
Identifiers: *Nearshore waters, Spartina alterniflora, Reduction aeration flameless atomic absorption, Flameless atomic absorption spectrophotometry, Marsh grass.

Samples of estuarine and nearshore waters were collected in the area of the southeastern United States between Cape Romani, South Carolina and Jacksonville, Florida for mercury analysis by the reduction aeration flameless atomic absorption technique. Samples of Spartina alterniflora were taken from 2 areas of different salinity; sediment cores were also taken from those areas and from adjacent channels for comparison. Plankton samples were from surface waters nearshore and offshore of the northeast and southeast U.S. coast. All mercury samples were analyzed as the water samples. It was found that the transfer of mercury through an estuarine system of the Southeastern Atlantic Coast to the open ocean is controlled by: (1) mixing of estuarine waters with offshore waters; (2) loss in plant detritus due to rafting offshore; (3) migration of estuarine organisms to offshore areas. An additional loss of mercury from the estuarine system is due to sedimentation. A budget of mercury for estuaries along the Georgia Coast indicates that the dominant salt marsh plant, Spartina alterniflora, exerts a strong control on the migration of this metal. Mercury enters the estuary primarily in solution, delivering approximately 1.5 mg annually to each square meter of salt marsh. The annual uptake of mercury by the plant is approximately 0.7 mb/sq m of salt marsh. (Holoman-Battelle)

POLIOVIRUS IN A WATER SUPPLY,
Michigan Dpt. of Public Health, Lansing. Bureau of Environmental Health.
T. L. Vander Velde, and T. C. Broyer.
Journal of the American Water Works Association, Vol 65, No 5, p 345-348, May 1973. 4 tab, 2 fig.

Descriptors: *Isolation, Water pollution sources, *Water supply, *Drainage wells, Waste water (Pollution), *Potable water, *Sewerage, Methodology, Environmental effects, E. coli, Bioindicators, Pollutant identification, *Viruses, Coliforms, Chlorination, Chlorine, Water sampling, Electron microscopy, Centrifugation, *Michigan.
Identifiers: *Poliovirus, Culture media, Red Cedar River, Selective media, Sample preparation.

This is a two-part paper concerning the isolation of poliovirus from well water in Monroe County, Michigan. The first article considers construction of the well, geological features of the area, and the operation from which water samples were taken. The second article discusses laboratory and research techniques involved in the isolation of the poliovirus. A 5-gallon sample was taken from the well and divided into two equal volume. Fifty ml of water were removed from each sample and 10 ml were used to seed five tubes of lauryl sulfate double-strength broth to detect coliforms. Two samples were concentrated on the ultracentrifuge and tested for virus on green, African-monkey kidney-cell cultures. A virus was isolated and identified as poliovirus 2. E. coli was recovered from the concentrated samples. The tests indicated that viruses are viable and can survive where bacteria do not. In this case, there was little evidence of contamination and it required a great deal of concentration of the samples before the coli organisms and the virus were detected. (Mortland-Battelle)

INVESTIGATION OF THE ENVIRONMENTAL FACTORS WHICH AFFECT THE ANAEROBIC DECOMPOSITION OF FIBROUS SLUDGE BEDS ON STREAM BOTTOMS,
Lawrence Univ., Appleton, Wis.
A. M. Springer.
Available from--Univ. Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 73-7,166. Ph D Dissertation, 1972. 178 p.

Descriptors: *Distribution, *Biodegradation, *Pulp wastes, Fibers (Plant), Cellulose, Mathematical models, Energy budget, Pulp and paper industry, Sludge, Sludge digestion, Water temperature, *Wisconsin.
Identifiers: *Fox River (Wis), Glucose, Cellobiose.

Redistribution and decomposition of fibrous sludge from paper mills have been studied in the lower Fox River between Lake Winnebago and Green Bay, Wisconsin. In June 1970 approximately 50 percent of the river bottom was covered with fibrous sludge to a depth which ranged from six inches to several feet. A mathematical model was developed to predict sludge distribution, and it appeared to depict actual river conditions quite well. Approximately 4/5 of the lower Fox River is subject to sludge deposition, scour, and redistribution; while the remaining 1/5 is either always free of sludge or contains permanent beds. The principal mechanism for sludge bed destruction is decomposition, since scour and flotation merely relocate the sludge at another position in the river. A linear temperature profile is found in the bed, indicating that the energy generated by the decomposition process is negligible in comparison to that conducted in from outside the bed. Laboratory studies demonstrated that anaerobic decomposition is the principal mechanism for the destruction of organic matter in a sludge bed. Chemical pulps anaerobically decompose faster than do groundwood pulps of similar surface-to-volume ratios by a factor of about two. The rate-limiting step in the anaerobic decomposition process is the breakdown of cellulose into glucose and/or cellobiose. Temperature has an appreciable effect on the rate of fibrous sludge anaerobic decomposition. Appreciable differences in rate of decomposition occur at different river locations and at different times of the year in the same location. The life of a fibrous sludge bed in the lower Fox River would be one to two years if no new material were added to the bed. (Little-Battelle)

TRACE ELEMENT TRAPPING IN PTEROPOD TESTS,
Yale Univ., New Haven, Conn. Dept. of Geology and Geophysics.
K. K. Turekian, A. Katz, and L. Chan.
Limnology and Oceanography, Vol 18, No 2, p 240-249, March 1973. 3 fig, 3 tab, 15 ref.

Descriptors: *Trace elements, *Absorption, *Plankton, *Transport depletion, Gastropods, Sea water, Heavy metals, Path of pollutants, Neutron activation analysis, Chemical analysis, Atlantic Ocean, Mollusks, Invertebrates, Iron, Chromium, Cobalt, Kinetics, Methodology.
Identifiers: *Instrumental neutron activation analysis, *Pteropods, *Shells, Rare earth elements, Fate of pollutants, Detection limits, Sample preparation, Lanthanum, Samarium, Europium, Thorium, Scandium, Antimony, Selenium, Particulate matter, *Gulf of Aqaba, Cerium, Long Island Sound, Cavolinia quadridentata, Clio pyramidata, Cavolinia unicata, Creseis acicula, Styliola tubula, Limacina retroversa.

Pteropod tests from the Gulf of Aqaba and the South Atlantic Ocean and 'bulk' (soft tissue) plankton samples from Long Island Sound were analyzed by instrumental neutron activation analysis (INAA) for 11 trace metals (Fe, Ce, La, Sm, Eu, Th, Sc, Cr, Co, Sb, Se) to study the trapping and transport mechanisms for these metals in the oceans and the capability of pteropods to modify the composition of seawater during this process. The internal correlations among these metals strongly suggest that a finely particulate (less than 0.2 micron) authigenic iron-rich phase (hydrated oxide or phosphate) is trapped by both the soft and hard tissues of plankton and that this phase is the major carrier of several of the trace metals. Assuming that the iron-rich floc-trapping mechanism is applicable to all pelagic calcareous tests, then the downward flux of iron and associated trace elements carried by these tests can be assessed. This assumption leads to the conclusion that the iron and the associated trace elements have residence times in the deep water of the same order of magnitude as that of the deep water itself. BACTERIAL DEGRADATION OF DETERGENT COMPOUNDS,
Missouri Univ., Columbia. Div. of Biological Sciences.
R. A. Goodnow, and A. P. Harrison, Jr.
Applied Microbiology, Vol 24, No 4, p 555-560, October 1972. 3 tab, 6 ref.

Descriptors: *Surfactants, *Microbial degradation, *Detergents, Biodegradation, Aerobic bacteria, Assay, Linear alkylate sulfonates, Water pollution, E. coli, Pollutants, Pathogenic bacteria, Coliforms.
Identifiers: *Bacterial physiology, *Fate of pollutants, Tallow alkyl sulfate, Alkyl ethoxylate sulfate, Culture media, Substrate utilization.

A survey for surfactant degradation among aerobic bacteria has been undertaken. Tests have been made in peptone medium where such a degradation, if it occurs, will be gratuitous. Tallow-alkyl-sulfate, alkyl-ethoxylate-sulfate, and linear-alkyl-benzene-sulfonate were used. Forty-five strains of 34 species in 19 genera degrade one or more of these detergent compounds. With some species, the surfactant inhibits degradation without inhibiting growth, whereas with one species slight degradation took place even at a toxic concentration of surfactant. SALT POLLUTION OF A SHALLOW AQUIFER--INDIANAPOLIS, INDIANA,
Indiana State Univ., Terre Haute. Dept. of Geography and Geology.
H. W. Dennis.
Ground Water, Vol 11, No 4, p 18-22, July-August 1973. 5 fig, 1 tab, 6 ref.

Descriptors: *Water pollution sources, *Groundwater movement, *Path of pollutants, *Salts, Saline water, Sodium chloride, Deicers, Salinity, Indiana.
Identifiers: *Indianapolis.

Runoff from large quantities of deicing salts can contaminate groundwater. Tests of water samples from shallow wells in 1967, 1968, and 1973 document the loss of a water supply in an Indianapolis, Indiana, suburban housing development. In 1966 a salt company taking advantage of the location relative to the transportation net of the region, established a distribution point for highway deicing salts at Stout Field in Indianapolis, Indiana. The salts, only partially protected from the elements, were stored on the southwest end of the abandoned southwest-northeast runway. Runoff from any freshet or storm carried salt to the south and contaminated a shallow aquifer. Investigations by State and city health officials led to removal of the salt. With the salt removed, the same processes which led to the problem aided in flushing and dilution of the high chloride water. In a little over a year's time, dilution by rapid recharge of storm water into the shallow aquifer had reduced the chloride content of the water to a palatable level. Five years after the salt was removed, the chloride level is approaching acceptable limits. (Knapp-USGS)

RADIOCHEMICAL MONITORING OF WATER AFTER THE CANNIKIN EVENT, AMCHITKA ISLAND, ALASKA, OCTOBER, 1972,
Geological Survey, Lakewood, Colo.
L. J. Schroder, and W. C. Ballance.
Available from NTIS, Springfield, Va 22151 as USGS-474-169, Price $4.00 printed copy; $1.45 microfiche. Report USGS-474-169 (Amchitka-40), May 1973. 15 p, 3 fig, 2 tab, 5 ref. AEC Contract AT (29-2)-474.

Descriptors: *Nuclear explosions, *Radiochemical analysis, *Alaska, *Water pollution sources, Tritium, Water analysis, Correlation analysis, Water quality.
Identifiers: *Amchitka Island (Alaska), Gross alpha activity, Gross beta activity.

Water samples were collected from Amchitka Island, Alaska, during October 1972. Tritium determinations were made on all samples collected and gross alpha and gross beta/gamma determinations were made on 41 samples. The gross alpha and gross beta determinations when compared with previously determined ranges for freshwaters on Amchitka Island show no trends. The gross alpha activity, as U equivalent, ranged from less than 0.3 to 1.7 pCi/liter (picocuries per liter) for the October 1972 sampling; one value was less than 2.7 pCi/liter. This compares with a range from less than 0.1 to 23 pCi/liter in freshwaters on Amchitka observed prior to detonation of Cannikin as reported by Beetem, Washington, Janzer, and Schroder (1971). The gross beta activity in water as Cs-137 equivalent in the October 1972 samples ranged from 1.7 to 14 pCi/liter. This range, compared to the range observed in freshwater samples obtained prior to Cannikin (less than 1.0 to 36 pCi/liter), shows no indication of event-related radioactivity. The only water samples having detectable (greater than 640 pCi/liter) tritium activity were those collected at the Long Shot site. The sample from ST01-52, Weir 1, which represents surface water drainage of the Long Shot site, had a tritium concentration of 790 pCi/liter. (Woodard-USGS)

INVESTIGATION OF THE NATURE, EXTENT AND FATE OF NATURAL OIL SEEPAGE OFF SOUTHERN CALIFORNIA,
California Univ., Santa Barbara.
P. G. Mikolaj, A. A. Allen, and R. S. Schlueter.
Available from NTIS, Springfield, Va. 22151 as COM-73-10447 - Price $3.00 printed copy; $1.45 microfiche. Preprint of Paper OTC 1549, presented at 4th Annual Offshore Technology Conference, Houston, Texas, May 1-3, 1972. 16 p, 6 fig, 1 tab, 19 ref. NSF Grants GH-43 and GH-95, NOAA SG USDC 2-35208-5.

Descriptors: *Water pollution sources, *Oil, *Coasts, *Bays, *California, Seepage, Geomorphology, Surveys, Oily water, Data collections, Evaluation.
Identifiers: *Natural oil seepage, Oil slicks.

Natural oil and gas seeps in the Santa Barbara Channel and in Santa Monica Bay have been investigated using aerial, surface, and underwater survey techniques. These studies have provided an insight to the nature and extent of natural submarine seepage and have resulted in the development of procedures and equipment for investigating oily material in the marine environment. Ten separate zones of offshore seepage have been investigated and extensive bottom surveys at some of these sites have revealed ocean floor conditions, modes of oil release, and seepage flow rates. Oil is released from these seeps at a total rate approaching 100 barrels per day, and the resulting oil slicks contaminate several square miles of surface water. Standardized methods have been developed for sampling, classifying, and characterizing oil-tar beach pollutants; these techniques have been field tested and have provided baseline pollution levels along several miles of coastline. (Woodard-USGS)

TRACE METAL BASELINE STUDIES ON THE MURDERKILL AND ST JONES RIVERS, DELAWARE COASTAL PLAIN,
Delaware Univ., Newark. Dept. of Geology.
F. Bopp, III, F. K. Lepple, and R. B. Biggs.
Available from NTIS, Springfield, Va. 22151 as COM-73-10580 - Price $3.00 printed copy; $1.45 microfiche. Delaware University College of Marine Studies Report DEL-SG-10-72, December 1972. 31 p, 11 fig, 3 tab, 5 ref.

Descriptors: *Baseline studies, *Water quality, *Trace elements, *Rivers, *Delaware, Construction, Sewage treatment, *Bottom sediments, Chemical analysis, Iron, Magnesium, Zinc, Chromium, Copper, Lead, Cadmium, Mercury, Nickel, Strontium, Correlation analysis, Water pollution sources.
Identifiers: *Murderkill River (Del), *St. Jones River (Del).

Concentrations of trace metals are tabulated for bottom sediment samples collected from the Murderkill and St. Jones Rivers in Delaware. The principal purpose is to establish a trace metal baseline for the Murderkill River prior to commencement of operation of the Kent County Regional Sewage Treatment Plant, presently under construction near Frederica, Delaware. Baselines will be established for iron, magnesium, zinc, chromium, copper, lead, cadmium, mercury, nickel and strontium. In addition to the establishment of these baselines, the second purpose is to contrast the Murderkill River baseline with a similarly established baseline for the St. Jones River, which has been the recipient of domestic sewage and industrial and other wastes for a number of years. By comparing the results of these two river systems' baselines, it is hoped that some projection may be made of those metals which should be reasonably closely monitored after commencement of operation of the sewage treatment facility. (Woodard-USGS)

EFFECT OF TIME, WATER FLOW AND PH ON CENTRIPETAL PASSAGE OF RADIOPHOSPHORUS ACROSS ROOTS OF INTACT PLANTS,
Connecticut Univ., Storrs. Dept. of Plant Science.
F. H. Emmert.
Plant Physiol. Vol 50, No 3, p 332-335, 1972. Illus.
Identifiers: *Bean roots, Centripetal passage, Humidity, Phaseolus-vulgaris, Phosphorus, Hydrogen ion concentration, *Radiophosphorus.

The effects of time, rate of the water flow and ambient pH on centripetal passage of radiophosphorus across intact bean (Phaseolus vulgaris) roots to the xylem were studied. Isotope which completed passage and entered the xylem stream, as well as amounts delivered to the plant top, served to measure centripetal passage. Centripetal passage of radiophosphorus increased parabolically reaching a maximum after 1 hr and maintained this level during the second hr. This pattern was consistent for all conditions studied. The curve suggested that passage did not progress as an abrupt front, but rather that it occurred through a phosphorus pool before reaching the xylem. Differences in rate of water flow through test plants, accomplished by adjusting the humidity of the foliage environment, did not significantly affect centripetal passage of radiophosphorus. Water flow did, however, profoundly influence composition of the xylem stream by altering the solvent to isotope ratio. Centripetal passage of radiophosphorus was not affected by solution pH in the acid range (pH 4.8, 5.2, 6.4), but was inhibited in the more alkaline range (pH 7.0, 7.5, 8.0). The similarity of these findings to those in the literature for phosphorus uptake by individual cells suggests that cell uptake may constitute the primary rate-limiting step in the over-all process of ion passage to the xylem.--Copyright 1973, Biological Abstracts, Inc.

ON THE WATER POLLUTION IN THE AREA OF URBAN DEVELOPMENT (IN JAPANESE),
Kobe Univ. (Japan). Faculty of Agriculture.
S. Coto, and N. Hatazawa.
Sci Rep Fac Agric Kobe Univ. Vol 10, No 1, p 97-101, 1971. Illus. English summary.
Identifiers: Bacteria, Fish, Pollution, *Urban development, *Water pollution, *Japan, Chlorides, Sulfides.

The amount of Cl' increases in accordance with the increase of the population density. Cl' contents of 3 rivers near Akashi City are practically equal, and also the concentration of Cl' has a tendency to be in proportion to that of SO4'. Biological O2 demand is high in the water of the Hazetani, lower in the Akashi, and highest in the Igawa. The pollution of the Hazetani has its origin in the waste from the livestock industry and that of the Igawa is caused by waste from factories. The numerical value of bacterium/ml in the water of the Igawa is the highest and is the least in the Akashi. While farmers use wells for the most part, it was found that the majority of well water is not fit to drink. The Osaka Group has several marine clay layers and in case of Shempoku New Town these layers were exposed to the air by the earthwork. The runoff water over the surface was contaminated with the marine clay (pH 2.71) and fishes in the reservoir died from the inflow water. The amount of SO4' was 110 ppm and the pH of the water was 4.2.--Copyright 1973, Biological Abstracts, Inc.
W73-12996

INFLUENCE OF WATER POTENTIAL ON GROWTH, ANTIBIOTIC PRODUCTION AND SURVIVAL OF CEPHALOSPORIUM GRAMINEUM,
Washington State Univ., Pullman. Dept. of Plant Pathology.
G. W. Bruehl, B. Cunfer, and M. Tioviainen.
Can J Plant Sci. Vol 52, No 4, p 417-423, 1972. Illus.
Identifiers: Antibiotic production, *Cephalosporium-gramineum, Growth, Survival, Wheat straw, *Fungus.

C. gramineum grew on agar media at osmotic water potentials from -1.3 bars to between -98 and -112 bars. The growth of antibiotic -producing (+) and nonproducing (-) isolates was affected equally by water potential. Antibiotic production was detected by bioassay over the entire range of significant growth (to about -83 to -98 bars). Production of antibiotic relative to the growth rate of C. gramineum was least when the fungus grew fastest and most when the fungus was under moderate water stress (between -27 and -55 bars). When (wheat) straws infested with C. gramineum were incubated on soil at 15C at various water potentials, + isolates had the least advantage over - isolates on water saturated soil (near 0 bar) and at the driest condition tested (-258 bars). In contrast, antibiotic-producing isolates had the greatest survival advantage between -10 and -67 bars, which corresponds to the range of water potentials within which antibiotic production was greatest relative to mycelial growth. The vigor of C. gramineum in straw on water-saturated soil indicates coexistence with bacteria; its performance between about -10 and -137 bars indicates that relatively xerophytic soil fungi are its most severe antagonists in nature.--Copyright 1973, Biological Abstracts, Inc.

5C. Effects of Pollution

ASPECTS OF THE BIOGEOCHEMISTRY OF CARBOHYDRATES AND PROTEINS IN AQUATIC ENVIRONMENTS,
Woods Hole Oceanographic Institution, Mass.
K. Mopper, and E. T. Degens.
Available from the National Technical Information Service as PB-212 685, $3.00 in paper copy, $1.45 in microfiche. Technical Report WHOI-72-68, September 1972. 249 p, 34 fig, 6 tab, 107 ref, 4 append.

Descriptors: *Geochemistry, *Biochemistry, *Carbohydrates, *Proteins, *Cycling nutrients, *Sediments, *Organic matter, Bottom sediments, Aquatic environments, Diagenesis, Degradation (Decomposition), Metals, Ions, Organic compounds, Paleolimnology, Amino acids, Organic wastes, Analysis, Diatoms, Coral, Plankton, Carbon, Nitrogen, Technology, Chromatography, Climatic zones, Analytical techniques, Sedimentology, Oceans.
Identifiers: Red Sea, Black Sea, Lake Tanganyika (Africa), Lake Kivu (Africa), Arabian Sea, Gay Head (Bermuda), Cariaco Trench (Venezuela), Walvis Bay (S. Afr.), Argentine Basin, Oyster Pond (Woods Hole, Mass.), Winthrop (Mass.), Cranston (Rhode Island), Foraminifera, Vertebrates, Iceland, New York Bight, Mineralized tissues, Sugar analysis.

Factors affecting organic matter cycling, factors determining quantity and quality of organic matter incorporated into sediment, effect on composition and structure of organic input at sediment-water interface, diagenetic factors affecting sediment organic matter, organic matter condition during diagenesis, and possible fossil organic matter use to elucidate paleo-environments are considered. In shallow regions of the ocean, input is predominated by tripton; in deep regions input is predominated by aged, refractory material with composition reflecting a composite of highly degraded tripton and particulate organic matter formed from dissolved organic matter. Biological degradation is limited to the upper 10-20 cm of sediment. At 20 cm below the sediment-water interface further diagenesis occurs more slowly and is controlled by processes such as organic-organic condensation, organic-metal ion complexation, organic-mineral interaction, and increasing temperature. The degree of metal complexation or carbohydrates is indicative of the Eh at the sediment-water interface. Amino acids become increasingly metal-complexed with time, hence, the degree of complexation of amino acids may not be as useful as that of sugars for determining paleo-acidizing and paleo-reducing conditions. Glucose content of sediment may give estimates of terrigenous input. A high amino acid to hexosamine ratio reflects high productivity, perhaps eutrophication. (Jones-Wisconsin)

Descriptors: *Degradation (Decomposition), *Aquatic populations, *Energy budget, *Detritus, Model studies, Streams, Leaves, Periphyton, *Michigan, Respiration, Predation, Grazing, Data collections, Digestion, Microorganisms, Data storage and retrieval, Data processing, Growth rate, Metabolism, Herbivores, Computer programs, Foods, Analytical techniques.
Identifiers: *Detrivores, *Macroconsumers, Leaf litter.

Energy budgets for key component macroconsumer species were delineated within the framework of a generalized model of stream ecosystem function. Emphasis was on natural field populations and the interrelation of data at the population level to the overall structure and function of woodland stream ecosystems. Species associated with leaf litter processing were studied: large species ('shredders') involved in fragmentation of microbially infested litter, and smaller species ('collectors') feeding on resultant fine detrital particles. Given existing data of temperate zone streams, the general pattern in undisturbed systems is a dependence upon the input of reduced carbon compounds of terrestrial origin and, therefore, the dominance of heterotrophic processing. Besides a general statement covering the overall aspects of leaf litter, predictions will be possible concerning relative roles of microbial populations, shredders and collectors, in the processing of large particle detritus. Consumption indices for representative species in relation to age, density, food quality and quantity, temperature and species interactions were determined. Tracer studies were employed for additional independent estimates of consumption index values in the case of shredders and for collectors and grazers when it is difficult to make gravimetric assessments of food supply. PREIMPOUNDMENT STUDY OF WEST POINT LAKE, GEORGIA,
Environmental Protection Agency, Athens, Ga. Southeast Water Lab.
R. F. Schneider, D. W. Hill, M. R. Weldon, and R. E. Gentry.
Available from the National Technical Service as PB-213 306, $3.00 in paper copy, $1.45 in microfiche. Technical Study TS 03-71-208-001.2, January 1972. 201 p, 30 fig, 12 tab, 21 ref, 10 append.

Descriptors: *Pre-impoundment, *Georgia, *Reservoirs, Physical properties, Chemical analysis, Biological properties, Bacteria, Benthos, Temperature, Color, Turbidity, Hydrogen ion concentration, Conductivity, Suspended solids, Dissolved solids, Dissolved oxygen, Biochemical oxygen demand, Alkalinity, Chlorides, Nitrogen, Phosphorus, Organic matter, Iron, Manganese, Phytoplankton, Periphyton, Invertebrates, Coliforms, Salmonella.
Identifiers: *West Point Lake (Ga.), Chattahoochee River (Ga.).

The proposed West Point Lake, Georgia, is designed to provide hydroelectric power, flood control, navigation, water supply and recreation. The potential for accelerated eutrophication and its associated nuisance problems are increased greatly by both past and current municipal and industrial development in the watershed. Thermal stratification is expected to occur following impoundment. Associated hypolimnetic problems of low dissolved oxygen, sulfide odors, and high levels of dissolved iron and manganese may also occur unless corrective measures are taken. Isolated Salmonella serotypes indicate several areas would be hazardous for recreation at present. Fecal coliform densities violate recreational water quality criteria at many stations. After closure of the dam, the increased residence time in the lake will tend to dampen water quality variations now present in the free-flowing streams and partially reduce bacterial densities and water turbidity from preimpoundment levels to levels acceptable for a variety of water uses. Following completion of secondary biological treatment and chlorination at a wastewater treatment plant, water quality should improve. Secondary treatment and disinfection by that time will also be provided by most other wastewater treatment plants involved. Combined sewer discharges during rains will probably cause problems for many years. (Jones-Wisconsin)

NUTRIENT ENRICHMENT AND EUTROPHICATION OF LAKE MICHIGAN,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske.
Available from the National Technical Information Service as COO-2003-17, $3.00 in paper copy, $1.45 in microfiche. Progress Report, July 1972. 25 p, 2 fig, 1 tab, 27 ref. AEC At (11-1)-2003.

Descriptors: *Eutrophication, *Lake Michigan, *Nitrogen, *Phosphorus, *Silica, Great Lakes, Phytoplankton, Productivity, Carbon, Ammonia, Chemical analysis, Cyanophyta, Diatoms, Model studies, Nutrients, Analytical techniques, Limiting factors, On-site tests, Laboratory tests, Water pollution effects, Trace metals, Vitamins.

A program has developed and focuses on phytoplankton, phytoplankton productivity, major plant nutrients, the distribution and interrelationship of these parameters, and causative mechanisms associated with accelerated eutrophication of the upper Great Lakes, particularly Lake Michigan. A general model that can be used to predict and assess the state and rate of eutrophication in the three upper Great Lakes was formulated. Of the major plant nutrients, phosphorus is the limiting nutrient; thus phosphorus inputs and supplied control eutrophication rate. In large lakes, such as the Great Lakes, which have long renewal times, net utilization of silica and nitrogen is an excellent means of assessing the extent and rate of eutrophication. Silica utilization is a good measure of the eutrophication rate in these lakes because phytoplankton assemblages are composed mainly of diatoms. Another valid measure is net nitrate nitrogen utilization until nitrogen is depleted or until significant nitrogen fixation occurs. Both limiting conditions seem to occur more or less simultaneously. Since phosphorus is the major limiting nutrient, rate of eutrophication should be predictable from concentrations of paticulate or total phosphorus. (Jones-Wisconsin)

GAS PRODUCTION IN SEDIMENTS OF LAKE MENDOTA, WISCONSIN,
Wisconsin Univ., Madison. Dept. of Soil Science.
R. L. Chen, D. R. Keeney, J. G. Konrad, A. J. Holding, and D. A. Graetz.
J Environ Qual. Vol 1, No 2, p 155-158. 1972.
Identifiers: *Gas production, Sediments, Wisconsin (Lake Mendota), *Lake sediments, Lakes.

Nitrate added to Lake Mendota sediment samples incubated under anoxic conditions disappeared rapidly. When 15NO3 was added, 15N2 appeared in the atmosphere within 24 hr. Gas collected from sediments in situ contained from 24 to 50% N2 and from 45 to 75% CH4. Sediment samples from 3 sites in the lake varying in depth of water column were incubated under He in the laboratory. Production of N2 and CH4 increased with time at a low (2 ppm) level of NO3-N addition, but CH4 production was inhibited for at least 27 days by addition of 100 to 1000 ppm NO3-N. Production of N2 was less at 1000 than at 500 ppm NO3-N added, probably due to suppression of the nitric oxide reductase enzyme system. Evidence was obtained that the denitrification pathway in lake sediments is the same as that reported for submerged soils.--Copyright 1972, Biological Abstracts, Inc.

THE INFLUENCE OF VEGETATION ON THE REDOX PROFILE IN THE SEDIMENT OF GRANE LANGSO, A DANISH LOBELIA LAKE,
Copenhagen Univ., Hillerod (Denmark). Freshwater-Biological Lab.
S. Wium-Andersen, and J. M. Andersen.
Limnology and Oceanography, Vol 17, No 6, p 948-952, 1972. 3 fig, 1 tab, 11 ref.

Descriptors: *Vegetation, *Oxidation-reduction potential, *Sediments, Lakes, Rooted aquatic plants, Oxygen, Photosynthesis, Iron compounds, Sands, Mud, Rhizosphere.
Identifiers: *Grane Langso (Denmark), *Lobelia, Littorella, Isoetes, Kalgaard So (Denmark), Isoetides, *Denmark.

The sediment redox profiles in Danish lakes supporting rooted plants is substantially changed by the vegetation. To a water depth of 4 m, sediment in Grane Langso consists of sand, and, at greater depths, of mud. Rooted vegetation occurs to a depth of 4-5 m, the most important plants being the isoetides: Littorella uniflora, Lobelia dortmanna, and Isoetes lacustris. The redox potentials and the pH were measured on two cores from each depth. Measurements of Eh in the sediment have shown the upper 20 cm of sediment is oxidized down to a 4 m depth. The constant Eh values can be explained by relative constant biomass of the isoetides throughout the year. In the laboratory Lobelia was manipulated to photosynthesize in the aquarium under simulated natural conditions. Oxygen liberation was 3-5 times greater by the roots than by the leaves, agreeing with the fact that root surface of Lobelia is 3-5 times larger than the leaf surface. It is concluded that the plants work as oxygen pumps. Presence of an oxidized rhizosphere depends on the presence of isoetides. If eutrophication causes their disappearance, the oxidized rhizosphere also disappears. (See also W73-12378) (Jones-Wisconsin)

SOME EFFECTS OF ARTIFICIAL FERTILIZATION ON ENCLOSED PLANKTON POPULATIONS IN MARION LAKE, BRITISH COLUMBIA,
British Columbia Univ., Vancouver. Inst. of Animal Resource Ecology.
M. Dickman, and I. E. Efford.
Journal Fisheries Research Board of Canada, Vol 29, No 11, p 1595-1604, 1972. 6 fig, 1 tab, 24 ref.

Descriptors: *Plant populations, *Fertilizations, *Plankton, *Succession, *Canada, Nutrients, Seasonal, Primary productivity, Nitrates, Phosphates, Standing crops, Cyanophyta, Chlorophyta, Chrysophyta, Euglenophyta, Chlamydomonas, Eutrophication, Algae.
Identifiers: *Marion Lake (British Columbia), Cryptophyta.

Initial effects of fertilization on species composition and bloom formation, whether or not a predictable pattern occurs following lake fertilization and how such a pattern is influenced by seasonal differences were studied. Three different nutrient regimes were used in four plywood enclosures at two stations in Marion Lake, B.C., to determine whether the pattern is dependent on type of fertilization. After a single application of nutrients in the fall, summer, and spring, primary productivity increased within a 2-week period whether nitrate, phosphate, or a combination of the two was used. The species responding to the three nutrients generally differed both within and between seasons. In all seasons, there was a decrease in total plankton diversity (based on productivity) accompanied by an increase in relative productivity of a few phytoplankton species. Phosphate was most stimulatory during fall. During spring, N + P was most stimulatory and nitrate next. In summer, N + P was again most stimulatory. Of the species that increased in density, 78% were not detectable at time of fertilization. A rapid increase in density of rare species culminated in a bloom 2-3 weeks after fertilization. (Jones-Wisconsin)

STRATIGRAPHY OF FOSSIL PIGMENTS AS A GUIDE TO THE POSTGLACIAL HISTORY OF KIRCHNER MARSH, MINNESOTA,
Ohio Wesleyan Univ., Delaware. Dept. of Botany and Bacteriology.
J. E. Sanger, and E. Gorham.
Limnology and Oceanography, Vol 17, No 6, p 840-854. 12 fig, 31 ref.

Descriptors: *Analytical techniques, *Marshes, *Geologic history, *Aquatic productivity, Sediment, Stratigraphy, Pigments, *Minnesota, Allogenic succession, Organic matter, Sedimentation rates, Paleolimnology.
Identifiers: *Fossil pigments, *Postglacial, *Kirchner Marsh (Minn.).

Whether data on fossil pigments would substantiate conclusions previously drawn from pollen and macrofossil studies about ecological and limnological changes that occurred during postglacial time was tested in Kirchner Marsh, Minnesota. Successional developments in postglacial ecology and limnology, revealed by concentration and diversity of sedimentary plant pigments, include a

peak of aquatic production reached during the early postglacial warm, humid interval about 10,000 B.P. Production levels then declined. Very low levels of aquatic production are indicated by about 6,000 B.P. in the middle part of a warm, dry interval which was followed by low pigment concentrations (except for a brief interval about 5,000 B.P.) but with a marked rise in the ratio of chlorophyll derivatives to carotenoids, indicating an increase in allochthonous organic input accompanying the return of cooler moister conditions. The result was encroachment of oak forest on the prairie, followed by succession to reed-swamp on the lake. Pigment data are generally in harmony with the ecological conclusions from pollen and macrofossils, but they provide much more information on changes in aquatic productivity at the site. This studyprovides further strong evidence that stratigraphic analysis of sedimentary pigments can be of fundamental value in paleolimnology. (Jones-Wisconsin)

CORRELATED LIGHT AND ELECTRON MICROSCOPE STUDIES ON BROWN ALGAE. II. PHYSODE PRODUCTION IN DICTYOTA,
Leeds Univ. (England). Dept. of Plant Sciences.
L. V. Evans, and M. S. Holligan.
New Phytologist, Vol 71, No 6, p 1173-1180, 1972. 5 plates, 44 ref.

Descriptors: *Microscopy, *Cytological studies, *Phaeophyta, Electron microscopy, Marine algae, Plant morphology, Biochemistry.
Identifiers: *Physodes, *Dictoyota, *Trearddur Bay (North Wales).

The chemical nature and other attributes of large irregularly shaped bodies of varying electron-opacity, present within chloroplasts of thallus and reproductive cells of Dictoyota dichotoma, were explored. These bodies, apparently extruding into the cell cytoplasm, differ from the more conventional small, intensely osmiophilic chloroplast inclusions and appeared more abundant at some seasons that at others. Whether on their release into the cell cytoplasm the extruded products correspond to any of the large number of components described earlier as occurring in Dictyota cells was also explored. The physodes of fucosan vesicles in vegetative and reproductive cells originate in the plastids. Precursor material expelled from the chloroplast matrix, may run together to produce large physodes in cell cytoplasm. Staining reactions indicate the physodes are phenolic or tannin-like, perhaps photosynthetic products. Physodes in thallis apical region are exceedingly resistant and stable compared with those in older parts of thalli. In addition to the possible occurrence of several different kinds of physodes, a 'chemical evolution' of fucosan may occur according to season or in different parts of the thallus, a theory supported by differential reaction to osmium tetroxide by the larger, older physodes compared with the apical physodes. STUDIES ON THE GROWTH OF PHAEODACTYLUM TRICORNUTUM. II. THE EFFECT OF ORGANIC SUBSTANCES ON GROWTH,
University Coll. of Swansea (Wales). Dept. of Botany.
J. Hayward.
Physiologia Plantarum, Vol 21, p 100-108, 1968. 3 fig, 3 tab, 29 ref.

Descriptors: *Plant growth, *Diatoms, *Organic compounds, Light, Phototropism, Carbon, Cultures.
Identifiers: *Phaeodactylum tricornutum, Heterotrophy.

Ability to grow heterotrophically appears in a number of genera and species through the major algal taxonomic divisions. There are indications of extremely limited heterotrophic ability among the Bacillariophyta and an apparent widespread occurence of obligate phototrophy. The possibility of heterotrophic nutrition of Phaeodactyllum tricornutum was studied by testing effects of a range of organic compounds upon its growth in the light. Results of experiments of 21 days duration at 18C under non-aerated conditions are expressed as percentage of growth in the basic mineral medium which is equated to 100. From the results obtained in the light a number of compounds were selected for testing as heterotrophic substances in the dark to determine any effect upon growth. No substance tested was capable of supporting growth of the diatom in the dark and it appears that the organism is obligately phototrophic. P. tricornutum is able to respire glucose, mannitol and lactate without the energy released being apparently available for growth. Some slight growth stimulation occurs in the light which appears to be partly due to occurrence of trace element impurities in the organic compounds. (Jones-Wisconsin)

PROCEEDINGS OF SEMINAR ON EUTROPHICATION AND BIOSTIMULATION.
California State Dept. of Water Resources, Sacramento.

Held at Clear Lake, California, Oct 19-21, 1971. November 1972. 229 p, 66 fig, 21 tab, 300 ref.

Descriptors: *Conferences, *Eutrophication, *Biological communities, Carbon, Inorganic compounds, Nutrients, Nitrogen, Phosphorus, Detergents, *California, Biochemistry, Sediment-water interfaces, Tile drainage, Geochemistry, Oxidation-reduction potential, Light, Temperature, Solar radiation, Photosynthesis, Productivity, Zooplankton, Management, Nutrient removal, Economics, Mathematical models, Phytoplankton, Hydraulic aspects, Bioassay, Algae, Sewage effluents, Growth rates, Waste water treatment, Oil pollution, Diatoms, Polychlorinated biphenyls, DDT, Limiting factors.
Identifiers: *San Francisco Bay-Delta, Algal growth potential.

This seminar was conducted for the purpose of defining, controlling, or limiting eutrophication in lakes and reservoirs. Papers were presented on the following subjects: The effect of inorganic carbon on eutrophication; Nitrogen: Recent studies on the role of nitrogen in the biostimulation and eutrophication of aquatic ecosystems; Phosphorus and eutrophication; Sediment-water nutrient interchange in eutrophic lakes; Effects of light and temperature on algal growth; The role of zooplankton in the process of eutrophication; Nutrient control in north San Francisco Bay; Mathematical modeling of phytoplankton populations; Algal bioassays: Examples, advantages and limitations of current approaches; AGP studies in the San Francisco Bay-Delta; PCBs and DDT. (See W73-12392 thru W73-12402) (Auen-Wisconsin)

THE EFFECT OF INORGANIC CARBON ON EUTROPHICATION,
Utah Water Research Lab., Logan.
Joel C. Goldman.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 3-53. 10 fig, 7 tab, 155 ref.

Descriptors: *Eutrophication, *Carbon, *Limiting factors, Inorganic compounds, Nutrients, Nitrogen, Phosphorus, Carbon cycle, Productivity, Alkalinity, Hydrogen ion concentration, Enzymes, Chemical reactions, Laboratory tests, Carbon dioxide.
Identifiers: *Inorganic carbon, Carbonic anhydrase, Carbon sources.

The role of carbon in controlling algal growth in natural waters, carbon cycling and metabolism, inorganic carbon chemistry, algal utilization of carbon, and concepts of nutrient limitation are discussed and reviewed. Organic carbon compounds may be synthesized from carbon dioxide through three types of reactions--photosynthesis by plants and algae, photosynthesis by certain bacteria, and carbon incorporation by other mechanisms. Extraction of carbon dioxide from an algal growth system through assimilation into algal biomass faster than it can be replaced through atmospheric carbon dioxide diffusion, respiration, fermentation processes, and readjustment of solid carbonate equilibria leads to increased pH. The slowest reaction involved in the chemical transformation of the ionic forms of inorganic carbon to free carbon dioxide could be rate limiting if carbon were limiting in an algal bloom and could be the controlling factor governing utilization of inorganic carbon in photosynthesis. What specific role the enzyme, carbonic anhydrase, has in relation to uptake of inorganic carbon by algae in natural waters still needs clarification. It is concluded that carbon limits productivity only under certain well defined conditions that occur relatively infrequently in nature. (See also W73-12391) (Jones-Wisconsin)
W73-12392

NITROGEN: RECENT STUDIES ON THE ROLE OF NITROGEN IN THE BIOSTIMULATION AND EUTROPHICATION OF AQUATIC ECOSYSTEMS,
Clear Lake Algal Research Unit, Lakeport, Calif.
Alexander J. Horne.
In: Seminar Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 55-70. 3 fig, 2 tab, 38 ref.

Descriptors: *Nitrogen, *Eutrophication, Nitrogen compounds, Nitrogen cycle, Limiting factors, Sea water, Freshwater, Marshes, Lentic environment, Nitrogen fixation, Algae, Productivity, Water pollution sources, Dentrification, Abatement, *California.
Identifiers: Nitrogen sources, *Clear Lake (Calif).

Role of nitrogen in eutrophication and biostimulation, biological methods of introduction of new nitrogen into aquatic ecosystems, and the essential conservatism of these systems is discussed in the light of recent work. It should be noted that the two major changes in physical state of nitrogen, denitrification and nitrogen fixation, occur in anoxic conditions or at least conditions of low dissolved oxygen. In almost all circumstances N-limitation, if it occurs, will be a temporary phenomenon subject to variations. N-limitation, seems to be found in marine, freshwater and marshy areas; examples are given. Areas shown to be N-limited are highly mixed or upwelling areas of open and coastal oceans, estuaries, and some freshwater lakes. The importance in eutrophication control of reducing N-inflow before it reaches the lake or sea is demonstrated. The approximate amount of accelerated eutrophication from a known N-input could be predicted because N forms an essential and reasonably constant percentage of body weight. The real effect on accelerated eutrophication depends on basin morphology. Contributions of nitrogen fixation to some lake budgets over the world are listed. (See also W73-12391) (Jones-Wisconsin)

PHOSPHORUS AND EUTROPHICATION,
California State Dept. of Water Resources, Sacramento.
Randall L. Brown, Donald B. Porcella, and Daan Toerien.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 71-81. 4 fig, 10 ref.

Descriptors: *Phosphorus, *Eurtophication, *Limiting factors, Detergents, Waste water (Pollution), Algae, Metabolism, Biochemistry, Phosphates, Scenedesmus, Phosphorus compounds, Nutrients, Nitrogen, *California, Growth rates, Nutrient removal, Tile drainage, Productivity.
Identifiers: San Joaquin Valley (Calif.), Firebaugh (Calif.), San Francisco Bay-Delta (Calif.), Phosphorus removal.

The relationship between phosphorus and algae is summarized in an attempt to provide some clarification of the role of phosphorus in algal metabolism. Phosphorus must be in orthophosphate form to enter into biochemical reactions within the cell; thus despite the publicity of P-containing detergents, they contain only the polyphosphate form which is not readily assimilated by algae. The exact role of phosphorus in algal metabolism is complicated by the changes in solubility of phosphorus compounds during algal growth stages and is also based on growth kinetics. The majority opinion is that, apparently, silicon may become limiting in the San Francisco Bay-Delta and algal populations may shift from predominantly diatoms to green algae. Lakes and reservoirs may act as their own phosphorus source when P entering the body of water is deposited on the bottom either as organic P bound in the algae or inorganic sediments and phosphorus precipitates. Phosphorus removal from influent water by alum or lime precipitation can be effective and economical in removing more than 95% of phosphorus in sewage; in situ reduction is accomplished by adding alum. Whether this waste treatment can be rationally defended in terms of the amount of environmental enhancement obtained per dollar expended is debatable. (See also W73-12391) (Jones-Wisconsin)
W73-12394

SEDIMENT-WATER NUTRIENT INTERCHANGE IN EUTROPHIC LAKES,
Utah Water Research Lab., Logan.
Donald B. Porcella, Kirk L. Schmalz, and William A. Luce.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, Caliornia, p 83-109. 1 fig, 5 tab, 23 ref.

Descriptors: *Sediment-water interfaces, *Nutrients, *Eutrophication, Algae, Biochemistry, Geochemistry, Cycling nutrients, Sorption, Chemical precipitation, Oxidation-reduction potential, Bottom sediments, Mixing, Distribution, Absorption, Productivity, Phosphorus, *Utah.
Identifiers: *Hyrum Reservoir (Utah).

Sediment role in controlling nutrient availability in eutrophic lakes is predicated on algal bloom relationship to sediment nutrients; the sediment nutrient materials available are nutrients reduced in overlying waters and their amount depends on duration of the bloom after restriction of nutrient input. Overall process involves physical sorption, chemical precipitation, and biological nutrient uptake from solution; then particulate inorganic and organic material is transferred to the bottom by settling or biological mechanisms. Chemical changes in sediments brought about primarily by microbial decomposition of organic matter result in organic matter mineralization as well as anaerobic conditions, which change the oxidation-reduction potential. In both eutrophic and oligotrophic lakes, sediments tend to accumulate more nutrients than they contribute to overlying water. Estimation of nutrient cycling through various release mechanisms indicates that considerable release does occur and an algal bloom could possibly be sustained by sediment-derived nutrients. Although phosphorus release may sustain an algal bloom, the rate is insufficient, under natural conditions, to maintain high algal concentrations when influent phosphorus is lowered. It seems feasible to determine release and accumulation rates and to develop descriptive models (including the different nutrients and their compartments) in order to evaluate the practical significance of sediment nutrient sink to algal productivity. W73-12395

EFFECTS OF LIGHT AND TEMPERATURE ON ALGAL GROWTH,
California State Dept. of Water Resources, Sacramento.
Randall L. Brown.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 111-131. 12 fig, 1 tab, 17 ref.

Descriptors: *Light, *Temperature, *Algae, *Plant growth, Solar radiation, Photosynthesis, Eutrophication, Light intensity, Pigments, Chlorophyll, Light penetration, Energy conversion, Metabolism, Nitrogen, Limiting factors, *California, Productivity.
Identifiers: San Joaquin Delta (Calif), Lake Tahoe (Calif-Nev).

In consideration of eutrophication and biostimulation, light availability to algal cells at a certain depth is determined by several factors and can be described by a modification of the Beer-Lambert law. Plant cells capture light energy by use of photosynthetic pigments, including chlorophylls, carotenes, xanthophylls, and phycobilins. Two pigments, chlorophyll-a and beta carotene, are found in the four major algal groups. Light effect on algal metabolism has been studied using both laboratory and field assays. General shape of the algal response to different light levels is illustrated. If algae develop under stable illumination, cells can become adapted to either high or low light. Algae can exhibit either positive or negative phototaxis. Algal responses directly affected by temperature include metabolism, reproduction, and distribution. Effect of temperature on light saturation intensity of a mixed population of Scenedesmus and Chlorella is illustrated. Of the two factors, light and temperature, light probably has a more direct effect, although temperature has an important indirect effect. The practical implications of the role of light in growth and metabolism appears when placing the blue-green algae in a light environment unfavorable for their growth. Other algae may then dominate. W73-12396

THE ROLE OF ZOOPLANKTON IN THE PROCESS OF EUTROPHICATION,
California Univ., Davis., Div. of Environmental Studies.
Peter J. Richerson.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 133-140. 1 fig, 1 tab, 10 ref.

Descriptors: *Water quality control, *Zooplankton, *Eutrophication, *Grazing, Algae, Phytoplankton, Crustaceans, Copepods, Rotifers, Cyanophyta, Productivity, California, Nevada, Daphina, Bacteria, Detritus, Management, Fish.
Identifiers: Kellicottia, Asplanchna, Diaptomus oregonesis, Keratella, Polyarthra, Lake Tahoe (Cal.-Nev.), Bosmina, Moina, Lake Erken (Sweden), Clear Lake (Calif.).

The process of zooplankton grazing and its impact upon algal populations as a possible management technique to alleviate eutrophication problems is examined. Grazing rates are expressed as clearing volumes--volume of water filtered (cleaned) of algae or other particles of a defined type per unit time--and are measured for common representatives of important freshwater zooplankton. Zooplankton often exhibit considerable selectivity in their grazing and there are usually pronounced difference in feeding efficiency depending upon the size of the algae. Many blue-green algae are not grazed at all, perhaps contributing to the obnoxious blooms. Phytoplankton biomass seems to cause an increase in zooplankton, which then graze the phytoplankton intensely, reducing phytoplankton biomass, although other hypotheses could be operative. It appears from the estimations presented that grazing is more likely to be a dominant term in the biomass equation in eutrophic than oligotrophic lakes. Zooplankton grazers may derive a significant proportion of their nutrition from sources other than algae, perhaps detritus and bacteria. Several schemes are conceivable in considering zooplankton as populations whose manipulation might contribute to control of algal blooms. Although management of zooplankton for control of eutrophication symptoms is not impossible, no proven techniques exist at present. (See also W73-12391) (Jones-Wisconsin)
W73-12397

NUTRIENT CONTROL IN NORTH SAN FRANCISCO BAY,
Brown and Caldwell, Inc., San Francisco, Calif.
Richard C. Bain, Jr., and Lyle N. Hoag.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 141-162. 9 fig, 29 ref.

Descriptors: *Productivity, *Nutrient removal, *Control, *California, Water quality control, Management, Nitrogen, Phosphorus, Seasonal, Eutrophication, Carbon, Waste water treatment, Algae, Limiting factors, Silica, Diatoms, Standards, Water pollution control.
Identifiers: North San Francisco Bay (Calif.), Antioch (Calif.), Suisun Bay (Calif.), Nitrogen removal.

The San Francisco Bay-Delta area is being studied for a water quality management plan. The present water quality, the rationale for nutrient control, monitoring, source control, treatment processes, and need for nutrient removal are considered. Evaluation of total nutrient content includes nutrient content of algal cells as well as remaining inorganic nutrients in the water mass. Measurement of nutrient forms and density of algal crops provide needed data to help interpret biostimulatory effects. Importance of various nutrients for a particular area can best be determined through evaluation of seasonal spatial nutrient dynamic in the water, algal bioassays with various nutrient inocula and consideration of effluent and receiving water quality relative to chemical composition of algal cells. Phosphorus controls are needed to insure against nutrient imbalance which may cause undesired shifts in dominance of algal forms particularly in view of possible increased clarity and decreased dissolved silica resulting from reduced Delta outflow. Although little economic pressure on dischargers has been applied, as more sewerage agencies are required to remove nutrients, ordinances and industrial service charges will reflect the resulting costs, giving an economic incentive to nutrient source control. Various nutrient removal processes are currently available to wastewater treatment designers. (See also W73-12391) (Jones-Wisconsin)

ries, Hydraulic aspects, Temperature, Respiration, Solar radiation, Photosynthesis, Zooplankton, Nutrients, Deltas, Grazing, Light intensity, Mortality, *California, Forecasting.
Identifiers: Antioch (Calif.), *Suisun Bay (Calif.).

Because of nonlinearity of interrelationships among variables governing phytoplankton growth, growth rates are not simply determined. A mathematical model considering combined, changing effects of variables determining growth rates was developed. The factors which combine to determine the abundance of phytoplankton in a body of water include: the physical environment consisting of the hydraulic regimen transporting phytoplankton, water temperature governing rates of growth and respiration, and incident solar radiation providing energy to support photosynthesis; the zooplankton population which, preying upon the phytoplankton, is thus dependent upon the abundance of phytoplankton; the nutrient supply which is regulated by hydraulic transport. Nutrients are depleted as they are consumed by growing phytoplankton, and the supply may be augmented by nutrients contained in local waste discharges. The model has been verified using data collected during 1966 in a portion of the Sacramento-San Joaquin Delta and Suisun Bay. After having been adjusted to reproduce the 1966 data, the model was used to predict phytoplankton populations resulting from an increase in nutrient discharges to the study area. ALGAL BIOASSAYS: EXAMPLES, ADVANTAGES, AND LIMITATIONS OF CURRENT APPROACHES,
Environmental Protection Agency, San Francisco, Calif. Water Quality Office.
Milton G. Tunzi.
In: Seminar on Eutrophication and Biostimulation, October 1921, 1971, Clear Lake, California, p 173-197. 9 fig, 4 tab, 7 ref.

Descriptors: *Analytical techniques, *Algae, *Bioassay, Photosynthesis, On-site tests, Cultures, Laboratory tests, Testing procedures, Plant growth, Eutrophication, Productivity, Sewage treatment, Agriculture runoff.
Identifiers: Flasks, Static batch cultures, Chemostats.

Algal bioassays to determine the limiting major or minor nutrient for growth, set nutrient levels to avoid algal problems, locate algal bloom caused when several inflows are involved, and determine desirability of probable inflows are evaluated. There are three basic approaches in determining algal cell responses: photosynthetic rate measurements, static flask cell-mass cultures, and chemostat steady-state systems. The photosynthetic approach has been particularly applicable to field in situ assays while the static flask in applicable to laboratory long-term experiments. Recently, chemostats have been proposed as the better approach to algal bioassays because they provide realistic estimates of the algal growth parameters. The applicability of the three methods depends upon the type of data desired, time consideration, economic factors, and the environment under study. Photosynthetic measurements are the best approach to in situ studies. Flasks or static batch cultures give rapid information on algal response to varying concentrations of biostimulants. Chemostat systems are more suitable for long-term studies when time, money, and trained personnel are ample. The kinetic constants evolved can be used to make predictions about yield and algal mass produced by a constant pollution inflow into a receiving water. (See also W73-12391) (Jones-Wisconsin)

AGP STUDIES IN THE SAN FRANCISCO BAY--DELTA,
California State Dept. of Water Resources, Sacramento.
Randall L. Brown.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 199-221. 10 fig, 2 tab, 12 ref.

Descriptors: *Productivity, *Algae, *California, *Bioassay, Monitoring, Nutrients, Waste treatment, Technology, Diatoms, Chlorophyta, Cyanophyta, Nitrogen, Tile drainage, Phosphorus, Chlorophyll, Toxicity, Sewage effluents, Oil pollution, Waste identification, Municipal wastes, Silica, Methodology, Analytical techniques.
Identifiers: *Algal growth potential, San Francisco Bay-Delta (Calif.), San Joaquin River (Calif.), San Pablo Bay (Calif.), Delta-Suisun Bay (Calif.).

A review is presented of the available data accumulated by assays to determine effects of various nutrients on algal growth in the San Francisco Bay-Delta and/or to evalutate the effects of treatment processes on biostimulation. The use of algal growth potential data is put in perspective. Summaries of some studies are: The conclusion in the 1967 EPA report is that the addition of nitrogen from agricultural drainage will increase algal growth in the Bay-Delta waters. Nitrogen removal studies by biological treatment at the Agricultural Wastewater Treatment Center indicate that P alone had no effect, N alone caused increased growth, and N + P resulted in the most pronounced effect in tile drainage mixed with San Joaquin River water. The Kayser report indicates that, generally, nitrate increased maximum cell numbers (except in Lower Bay) and had little effect on growth rate. Secondary municipal or refinery effluent was either inhibitory or stimulatory depending on the waste concentrations and water source, although usually activated sludge effluent was stimulatory. Results of an 18-month study of the effects of waste discharges on Bay organisms are summarized. A method of using organisms from lower trophic levels (bacteria, algae, protozoa) to bioassay specific compounds and complex municipal wastes was developed. (See also W73-12391) (Jones-Wisconsin)

PCBS AND DDT,
Environmental Protection Agency, San Francisco, Calif. Water Quality Office.
Gerald L. Muth.
In: Seminar on Eutrophication and Biostimulation, October 19-21, 1971, Clear Lake, California, p 223-226. 3 fig.

Descriptors: *Polychlorinated biphenyls, *DDT, *Molecular structure, Gas chromatography, Pesticides, Chemical analysis, Water sampling, Chlorinated hydrocarbon pesticides, *Pollutant identification.

Chemical analysis to determine presence and concentration of the organic compounds, PCBs (polychlorinated biphenyl) and DDT (dichlorodiphenyl-trichloroethane) in aquatic environments is difficult because of their similar molecular structures. As with the PCBs, the chlorine atoms of DDT can be located at different sites. In contrast to the PCBs, each DDT molecule will contain only two chlorine atoms. When produced the DDT will be approximately 80% pp'DDT and 12% op DDT, with the remaining 8% having other configurations including DDD. The two compounds can be distinguished from each other by using more than one gas chromatographic column with differing liquid phases. The procedure includes a standard hexane extraction, florish clean up, and then gas chromatographic determination. The computerized gas chromatographic mass spectrograph is used as final proof to determine the existence and differentiation between PCBs and other pesticides. The gas chromatographic peaks of the PCBs overlap not only with DDT, but also with lindane, aldrin, DDE, and other pesticides. DDT and PCBs also react similarly in aquatic environments; both accumulate in the fatty tissues of organisms, exhibit bio-magnification, are non-soluble in water, sorb onto sediment particles, and exhibit similar toxicity. ARSENIC AND CADMIUM IN THE ENVIRONMENT,
Oregon State Univ., Corvallis. Environmental Health Sciences Center.
S. L. Wagner.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 45-57, January 1973. 21 ref.

Descriptors: *Pollution effects, *Heavy metals, *Human pathology, *Arsenic, *Cadmium, Public health, Toxicity, Trace elements, Hazards.

Arsenic is ubiquitous in our environment and can be found in air, soil, or water. Most concentrations in water and air are in the range of a few parts per billion, whereas soil concentrations are often a few parts per million. The element does not appear

to accumulate in the food chain, and most foods do not contain high concentrations of arsenic with the single exception of seafoods. For example, whereas an arsenic tolerance in foods has been established as about 3 ppm, seafoods normally contain concentrations of arsenic ranging from 2 to 30 ppm. Cadmium occurs naturally in only trace amounts with the exception of a relatively high concentration found in association with zinc and lead. Most exposure has been from occupational exposure in workers involved in battery manufacture, electroplating, the making of alloys, welding and solders, ceramics, and vapor lamps. Cadmium is believed to inhibit the synthesis of iron into hemoglobin, and therefore may produce a secondary type of iron deficiency anemia. As with arsenic, the compound generally exhibits toxicity via the gastrointestinal route, but, again, the inhalation of cadmium fumes is much more toxic than the ingestion of the cadmium salts. Present threshold limit value for cadmium oxide is 0.1 mg per cu m of air. (See also W73-12604) (Woodard-USGS)

EFFECT OF HEAVY METALS ON FISH,
National Environmental Research Center, Corvallis, Oreg. Western Fish Toxicology Station.
G. Chapman.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 141-162, January 1973. 5 tab, 23 ref.

Descriptors: *Water pollution effects, *Heavy metals, *Fish, Toxicity, Ecology, Ecosystems, Food chains, Water chemistry, Trace elements, Chemical reactions, Water properties, Zinc, Copper, Cadmium.
Identifiers: *Pollution tolerance (Fish).

A review of literature with respect to the toxicity to fish of the heavy metals, zinc, copper, and cadmium, showed a wide range of values (for each metal), which were cited as 96-hr LC50 values, i.e., the concentration which kills 50% of the test animals in 96 hours. For zinc this range was 90 to 40,900 ppb; for copper 46 to 10,000 ppb; and for cadmium 470 to 9,000 ppb. Two general conclusions are that toxicity varies inversely with hardness, and that salmonids (trout and salmon) are more susceptible than most other common test species (primarily bluegills, Micropterus salmoides; and goldfish, Carassius auratus; and perhaps fathead minnows, Pimephales promelas.) Disregarding species and age, all of the other generally recognized factors which influence the toxicity of heavy metals to fish largely do so by influencing the rate of accumulation of the metal and, primarily, the rate of uptake of the metal. Thus pH, hardness and alkalinity, temperature, and dissolved oxygen level all affect the rate of uptake of the metal by changing either the biological availability of the metal by altering its form or by altering the rate and volume of ventilation of the fish. W73-12611

EFFECTS OF METALS ON FERTILIZATION AND DEVELOPMENT IN FISH,
Oregon Cooperative Fishery Unit, Corvallis.
J. D. McIntyre.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 163-168, January 1973. 8 ref.

Descriptors: *Water pollution effects, *Heavy metals, *Fish reproduction, Spawning, Fish eggs, Fish physiology, Toxicity, Trace elements, Fish types.
Identifiers: *Pollution tolerance (Fish).

A literature review shows that successful fertilization of fish may be prevented by toxic metals through effects on behavior. In long term studies of the effects of metals on various life history stages of the brook trout, males in exposure levels of 3.4 ppb cadmium were seized by severe muscle spasms as females began to move gravel in redd preparation. These males were generally unsuccessful in fertilizing the eggs and eventually died. Direct effects of metals on gamete survival may prevent successful fertilization. Results of an acute test in which samples of steelhead trout sperm were held in various concentrations of methylmercuric chloride for 30 minutes before they were combined with eggs indicated that at concentrations greater than 1 ppm, sperm viability was markedly reduced. The sexual development of fathead minnows in methylmercury is arrested at 0.25 ppb. Zebra fish that were permitted to spawn in several concentrations of phenylmercuric acetate produced fewer eggs at concentrations of 1 ppb or more as compared to lower concentrations. THE ROLE OF HEAVY METALS IN BIOLOGY,
Harvard Medical School, Boston, Mass.
F. S. Kennedy.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Resources Research Institute Report SEMN WR 016.73, p 169-182, January 1973. 1 tab, 2 ref.

Descriptors: *Water pollution effects, *Heavy metals, *Public health, *Human pathology, *Biochemistry, Environmental effects, Chemical reactions, Enzymes, Toxicity, Mercury, Cadmium, Lead.

The known biological involvement of mercury, cadmium, and lead can be expressed largely through their ability to form stable complexes with numerous biological ligands. These include SH and imidazole side chains of proteins, nitrogenous bases of DNA and RNA, as well as phosphate groups which occur in phospholipids, DNA and RNA, coenzymes, vitamins and metabolites. Aside from their widely known toxicity, mercury, cadmium, and lead all induce or enhance enzymatic activity in a large number of enzymes. Thus, when either mercury, cadmium, or lead is added to metal-free, bovine pancreatic carboxypeptidase A (a dual specificity zinc metalloenzyme), the reconstituted metalloenzymes all activity catalyze ester hydrolysis, the cadmium enzyme being a more active esterase then the natives zinc enzyme. However, unlike the native enzyme, the heavy metal substituted carboxypeptidases exhibit no peptidase activity so that cadmium can be regarded as both an activator and an inhibitor for this enzyme. That metals play a highly complex role in biological processes is obvious in the case of transition metals, which have been studied more extensively. For these, numerous metal ion deficiencies and diseases have been established including diseases which result from metal ion antagonisms or imbalances where deficiences of one metal relate to abnormal levels of second. W73-12613

SELENIUM IN THE ENVIRONMENT,
Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
P. H. Weswig.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institute Report SEMN WR 016.73, p 183-203, January 1973. 21 ref.

Descriptors: *Water pollution effects, *Heavy metals, *Public health, *Human pathology, *Animal pathology, Toxicity, Trace elements, Water pollution sources, Grasses.
Identifiers: *Selenium, Pollution tolerance.

Selenium is a relatively scarce element, its mean content in the crust of the each is about 0.09 ppm, and it is 66th in order of abundance. Selenium occurs especially in association with sulfur deposits and may also be found in combination with elements such as iron, lead, copper, and arsenic. In most soils not derived from sedimentary rocks the selenium concentration may be in the order of 0.05 ppm. In sea-bottom sediments and sedimentary rocks selenium values may be as high as 1.2 ppm. However, there are certain seleniferous regions in the world with much greater concentrations of selenium. In addition to South Dakota and Wyoming, seleniferous areas have been reported in Canada, Mexico, Ireland, Australia, Israel, and China. The safe upper limit for selenium in drinking water is 10 ppb according to the U.S. Department of Health. The presence of selenium in surface waters is a function of both pH and drainage slope with the highest concentrations coming generally from specific spring waters. Plants which grow on soils rich in selenium may concentrate the selenium and cause death to the animal consuming them. In Wyoming and North Dakota there are more then 24 species which may be classified as accumulators. Chronic selenium poisoning is caused by consuming plants containing from 10-30 ppm selenium. CRUSTACEAN PLANKTON AND THE EUTROPHICATION OF LAKES IN THE OKANAGAN VALLEY, BRITISH COLUMBIA,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
K. Patalas, and A. Salki.
Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 519-542, April 1973. 14 fig, 8 tab, 19 ref.

Descriptors: *Eutrophication, *Zooplankton, *Crustaceans, *Copepods, *Waterfleas, Invertebrates, Spatial distribution, Dominant organisms, Oligotrophy, Mesotrophy, Secondary productivity, Secchi disks, Specific conductivity, Dissolved solids, Calcium, Sodium, Potassium, Magnesium, Trophic level, Chlorides, Dissolved oxygen, Water sampling, Sulfates, Water temperature, Lake Ontario, Physical, Chemical properties, Thermal stratification, Hypolimnion, Epilimnion, Phosphorus, Nutrients, Oxygen sag, Deficient elements.
Identifiers: *Okanagan Lake, *Skaha Lake, *Osoyoos Lake Macroinvertebrates, Phosphorus load, Species abundance, Cyclops bicuspidatus thomasi, Diaptomus ashlandi, Diaphanosoma leuchtenbergianum, Daphnia longiremis, Daphnia thorata, Wood lake, Kalamalka Lake, Lake Washington, Vertical distribution, Horizontal distribution, Transparency, Bosmina longirostris, Bosmina coregoni longispina, Leptodora kindtii, Diphnia pulex, Daphnia schoedleri, Sida crystallina, Epischura nevadensis, Nauplii, Copepodids, Cyclops vernalis, Lake Mendota, Scapholeberis mucronata, Diaphanosoma brachyurum, Holopedium gibberum.

In early September 1969 and late August 1971, the vertical and horizontal distribution of temperature, Secchi disc visibility, some chemical components, and zooplankton abundance in lakes Okanagan, Skaha, and Osoyoos were investigated. Lakes Kalamalka and Wood were sampled only in late August 1971. Four different basins could be distinguished in Lake Okanagan; total dissolved

solids, calcium, and electrical conductivity within the lake decreased gradually from north to south. Macroelement values within lakes Okanagan, Skaha, and Osoyoos were apparently not substantially different but Kalamalka and Wood lakes were about twice higher in sodium, potassium, magnesium and about 1.5 higher in the total dissolved solids. Four species of copepods and nine species of cladocerans were found with Cyclops bicuspidatus thomasi and Diaptomus ashlandi dominant in all five lakes. Diaphanosoma leuchtenbergianum and Daphnia longiremis were the most common cladocerans in all five lakes. Daphnia thorata was common in all except Wood Lake. Eighty-nine percent of the total plankters in Lake Okanagan were located in the upper 50-m layer. Relatively little horizontal variation was found within the lake but two areas showed in both years greater abundance of plankton than the remaining areas. Crustaceans were usually less abundant inshore than offshore. Volume of settled net plankton varied from 8 cu mm/sq mm in Okanagan Lake to 31 cu mm/sq mm in Wood Lake. No substantial changes in species composition of zooplankton, Secchi disc visibility, and dissolved oxygen in the hypolimnion were found relative to the data of 1935 reported by Rawson. In 1969 and 1971 net plankton volumes were about five and three times larger, respectively, than in 1935. Calculations of total phosphorus load indicated that lakes Okanagan and Kalamalka are still in the oligotrophic range but close to mesotrophy. Lake Wood is moderately eutrophic and lakes Skaha and Osoyoos showed a marked degree of eutrophy. The estimates for lakes Wood, Skaha, and Osoyoos were supported by the values of the hypolimnetic areal deficits characteristic for highly eutrophic lakes. The trend of changes in phosphorus load during the past century is presented and predictions are made about the load in 1990 in situations with and without phosphorus removal from sewage. W73-12627

A STUDY OF INORGANIC SALTS REQUIREMENTS AND EFFECT ON THE MORPHOLOGY OF MARINE BACTERIA,
Georgetown Univ., Washington, D.C. Dept. of Biology.
R. R. Colwell.
Available from the National Technical Information Service as AD-754 122, $3.00 in paper copy, $1.45 in microfiche. Final Report, October 15, 1972. 24 p, 86 ref. Task No NR 306-667. Contract No N00014-69-A-0220-0006.

Descriptors: *Marine bacteria, *Deficient elements, *Nutrient requirements, Electron microscopy, Magnesium, Sodium, Potassium, Cations, Hydrostatic pressure, Sodium chloride, Seawater, Water sampling, Water temperature, Microbial degradation, Chesapeake Bay, Publications, Thermal stress, Estuarine environment, Classification, Systematics.
Identifiers: *Ultrastructure, *Cell morphology, Pure cultures, Substrate utilization, Psychrophilic bacteria, Numerical taxonomy, Vibrio marinus, Potassium chloride, Magnesium chloride, Heterotrophic bacteria, Hydrocarbons, Vibrio parahaemolyticus.

A review is given of studies conducted to determine the distribution of marine bacteria in coastal and deep ocean areas, ultrastructural studies of salt-requiring, psychrophilic marine bacteria subjected to temperature and salt deprivation stresses, and the molecular biology and numerical taxonomy of marine and estuarine bacteria. A previously unreported area deals with experiments designed to investigate the effects on fine structure during growth of seawater-requiring strains in media of reduced Na and Mg content. The fine structure studies demonstrated that profound and, in most cases, irreversible changes occurred in these cells under the given test conditions. Cultures grown in Mg deficient medium demonstrated markedly aberrant intra-cytoplasmic and cell envelope morphology. Structural effects resulting from growth in media of reduced ionic strength, i.e., concentration of NaCl, KC1, and/or MgC12 of 0.1 or 0.01 times that of standard seawater, were varied, depending greatly on the given strain studied. In general, without Mg, cells demonstrated walls and membranes of aberrant, 'wrinkled' appearance. Much of the effort in this aspect of the work was expended in establishing the experimental conditions and 'normal' morphology of the test strains. By varying concentrations of Na, Mg, and Ca ions, it was found that V. marinus demonstrated marked changes in cell morphology under conditions of severe ion depletion, whereas more subtle structural changes occurred under conditions of unbalance or slightly lowered concentrations of these ions (concentrations slightly lower than normally found in seawater). EFFECTS OF ZECTRAN INSECTICIDE ON AQUATIC ORGANISMS IN BEAR VALLEY CREEK, IDAHO,
Idaho Cooperative Fishery Unit, Moscow.
H. R. Gibson, and D. W. Chapman.
Trans Am Fish Soc. Vol 101, No 2, p 330-344. 1972. Illus.
Identifiers: Aquatic organisms, *Idaho, *Insecticides, Insects, Salvelinus-Malma, Terrestrial, Valley, *Zectran, Bear Valley Creek.

Assessed were effects of the experimental insecticide Zectran on aquatic organisms in Bear Valley Creek, Idaho in 1966. Hayden Creek drainage, nearby and not sprayed, served as a control. There was no significant fish mortality, and no effect on growth rate and condition of age O+, 1+, 2+ and 3+ dolly varden (Salvelinus malma). Insecticide applications did not increase emigration and instream movement of fish. No effects were noted on benthic aquatic insect numbers, but more insects drifted downstream for several hours beginning about 3 hr after spraying on 7 July 1966. Adult terrestrial insects, immature Heptageneidae and Rhyacophilidae, adult Chloroperlidae, and immature and adult Phryganeidae, Limnephilidae, and Blephariceridae increased in drift samples after spraying. It is concluded that Zectran insecticide damaged aquatic organisms very little.--Copyright 1973, Biological Abstracts, Inc.

MORTALITY CURVES OF BLUEGILLS (LEPOMIS MACROCHIRUS RAFINESQUE) SIMULTANEOUSLY EXPOSED TO TEMPERATURE AND ZINC STRESS,
Academy of Natural Sciences of Philadelphia, Benedict, Md. Benedict Estuarine Lab.
D. T. Burton, E. L. Morgan, and J. Cairns, Jr.
Trans Am Fish Soc. Vol 101, No 3, p 435-441. 1972. Illus.
Identifiers: Acclimation, *Bluegills mortality, Lepomis-Macrochirus, Survival, *Temperature, Time, Toxicity, *Zinc.

Bluegills were exposed to a temperature Zn interaction consisting of 5 temperature regimes and 5 concentrations of Zn which were 1.0, 5.6, 10.0 and 32.0 mg Zn++/l. All of the above concentrations of Zn and a control were tested on 5 groups of fish which were acclimated to (1) 20 plus or minus 1C, (2) 30 plus or minus 1C and fish which were acclimated to 20 plus or minus 1C and were exposed to temperature increases at the following rates: (3) 1C/24 hr (4) 1C/1 hr and (5) 1.5C/10 min until a maximum of 30C was reached. A rise in temperature could reduce the survival time of bluegills exposed to lethal and sublethal concentrations of Zn. Reductions in survival time were a function of the rates at which the temperature was increased. Bluegills acclimated to 20 and 30 and then exposed to a lethal concentration of Zn (32 mg Zn++/l) at each temperature died 2.6 times faster at 30C than at 20C. Fish acclimated to 20C and exposed to a temperature increase of 1.5C/10 min died 4.8 times faster than fish maintained at 20C. A sublethal Zn concentration (5.6 mg Zn++/l) produced no mortalities in 20C acclimated bluegills in 96 hr but was toxic to fish when the temperature was increased from 20-30C at a rate of 1.5 C/10 min.--Copyright 1973, Biological Abstracts, Inc.

Kagawa Daigaku Nogakubu Gakuzyutu Hokoku. Vol 23, No 1, p 112-117. 1971. Illus.
Identifiers: Cultivation, Culture farms, Environment, *Japan, *Land reclamation, Pollution, Porphyra-Tenera, Productivity, Reclamation, Waste, *Paper mill wastes.

The tidal current and waste water quality in the adjacent water area were investigated. The waste water discharged from drain pipe reaches the Nori culture farm. The low productivity of this farm is due mainly to pollution with the effluents, low exchange of sea water, and dense cultivation.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF SCHOOL WATER FLUORIDATION ON DENTAL CARIES: FINAL RESULTS IN ELK LAKE, PA., AFTER 12 YEARS,
H. S. Horowitz, S. B. Heifetz, and F. E. Law.
Identifiers: *Dental caries, Elk Lake (Penn), *Fluoridation, Lake, *Pennsylvania, Potable water.

The water supply of a rural school was fluoridated for 12 yr at a level of 5 ppm, 4.5 times the optimum level for community fluoridation in the area. On the final survey, children who attended the school continually had 39% fewer decayed, missing and filled teeth than their counterparts on the base line. Late erupting teeth (canines, premolars, and second molars) demonstrated twice as much relative caries protection as early erupting teeth (incisors and first molars). In both categories of teeth, the greatest benefits were observed on proximal surfaces, as high as 69% for late erupting teeth.--Copyright 1973, Biological Abstracts, Inc.

SALMONELLA CONTAMINATION OF RIVERS AND SEWAGES IN FUKUYAMA CITY, (IN JAPANESE),
Hiroshima Univ. (Japan). Faculty of Fisheries and Animal Husbandry.
H. Hashimoto, Y. Hirata, S. Harada, and T. Shimizu.
J Fac Fish Anim Husb Hiroshima Univ. Vol 10, No 2, p 153-160. 1971. Illus. (English summary).
Identifiers: Fuduyama City (Japan), *Japan, Rivers, *Salmonella, Cities, *Sewage.

Water samples (110) collected from rivers, sewage and slaughterhouses in Fukuyama city in the eastern district of Hiroshima prefecture, Japan were examined for Salmonella, from Oct. 1967 to Dec. 1968. It was found that 23.6% (13/55) of the rivers, 22.2% (8/36) of the sewages and 36.8% (7/19) of the slaughterhouse sewage were contaiminated. The percentage of contamination is smaller in Fukuyama city than that in a larger city, such as Tokyo or Osaka. Thirty-three strains of Salmonella isolated from water samples were divided into the following 11 serotypes: S. derby, S. typhimurium, S. monevideo, S. thompson, S. mikawashima, S. narashino, S. enteritidis, S. meleagridis, S. give, S. senftenberg and S. westerstede. The environmental contamination of the area is increasing gradually, since new types of Salmonella, e.g., S. westerstede, etc. never found in Hiroshima prefecture before, were isolated.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF FLOODWATER ON OYSTERS IN MOBILE BAY,
Alabama Marine Resources Lab., Dauphin Island.
E. B. May.
Proc Natl Shellfish Assoc. 62: p 67-71. 1971. Illus.
Identifiers: *Alabama (Mobile Bay), Bays, Floodwaters, *Oysters, *Salinity, Water pollution effects.

Periodically, floodwaters entering Mobile Bay, Alabama, in winter and spring can lower the salinity to such a degree that oyster populations are affected. Oysters and oyster drills are killed and oyster setting is inhibited. The effects of low salinity were studied in 1970 and 1971 by quantitatively sampling oyster reefs and examining gonadal development. Most oysters survived long periods of exposure to salinity below 3%, but high mortality occurred on reefs where salinity was approximately 1%, for about 7 wk. Large errors were found in the box count method of estimating mortality.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF FERTILIZATION ON AQUATIC PLANTS, WATER AND BOTTOM SEDIMENTS,
Rohm and Haas Co., Spring House, Pa. Research Div. Labs.
J. B. Ryan, D. N. Riemer, and S. J. Toth.
Weed Sci. Vol 20, No 5, p 482-486. 1972. Illus.
Identifiers: *Algae, Aquatic plants, *Bottom sediments, Cation, Elodea-Canadensis, Exchange, *Fertilization, Myriophyllum-Spicatum, Nutrients, Organic matter, Plants, Potamogeton-Pulcher, Sediments, Water pollution effects.

A 2-yr field study was conducted to determine the effects of fertilization on elodea (Elodea canadensis Michx.), eurasian watermilfoil (Myriophyllum spicatum L.), and heartleaf pondweed (Potamogeton pulcher Tuckerm.). Plants, water, and sediment were sampled and inorganic mineral contents determined. Water concentrations of NO3, NH4, P and K increased sharply following fertilization and generally reached maximum values within 7 days after treatment. Concentrations of these nutrients decreased rapidly after reaching maximum values. In the first yr, plant growth was not increased due to fertilization while in the second yr only heartleaf pondweed produced significantly greater yields. Elodea and eurasian watermilfoil grew better in the control environment, presumably due to less competition from algae, whose growth was increased by the addition of fertilizer. At the end of the study the top 1.3 cm of bottom sediment had increased in cation exchange capacity, organic matter, total N, and available P for all treatments while the underlying sediment remained relatively unchanged. Available P was greater in the surface of the fertilized sediment than in the surface of the control sediment.--Copyright 1973, Biological Abstracts, Inc.

DIATOM POPULATION DYNAMICS IN A CENTRAL IOWA DRAINAGE DITCH,
Bowling Green State Univ., Ohio. Dept. of Biology.
R. L. Lowe.
Iowa State J Res. Vol 47, No 1, p 7-59. 1972. Illus.
Identifiers: *Diatoms, *Drainage ditches, Gomphonema-Angustatum, *Iowa, Nutrients, Organic matter, Pollution, Seasonality.

Fifty-two consecutive weekly diatom samples were collected in 3 central Iowa drainage ditches from artificial substrates. Several chemical and physical environmental factors were measured simultaneously. The water at the 3 collecting stations differed mainly in the amount of organic enrichment present. Macronutrients did not appear to be limiting at any time during this study. Distinct population differences between the stations appear to reflect the degree of organic pollution. Five-hundred values were identified systemically and counted from each of the weekly samples, and a total of 67,000 were counted over the course of the study. One hundred and seventy-five species and varieties distributed among 28 genera were observed from the ditches; at least 28 of these species and varieties were unreported previously from Iowa. The density of diatoms was greatest in spring and summer at all 3 stations and the greatest number observed was 4.2 x 0.000001 cells/cm2 on July 25, 1969. Diatom densities became quite low during the late fall and winter. Gomphonema angustatum appeared in the largest numbers of any diatom and reached a maximum of 2.2 x 0.000001 cells/cm2. At one point it comprised 91% of the population.--Copyright 1973, Biological Abstracts, Inc.

NITRIFICATION IN SEDIMENTS OF SELECTED WISCONSIN LAKES,
Wisconsin Univ., Madison. Dept. of Soil Sciences.
R. L. Chen, D. R. Keeney, and J. G. Konrad.
J Environ Qual. Vol 1, No 2, p 151-154. 1972. Illus.
Identifiers: Lakes, *Nitrification, Organisms, Sediments, *Wisconsin, *Lake sediments.

Nitrification rates in lake sediment-water systems were investigated in the laboratory. Samples from Wisconsin eutrophic and oligotrophic hard- and soft-water lakes were incubated at 10C or 25C in the dark using nonstirred (i.e., quiescent) and stirred (magnetic stirrer) systems open to the atmosphere. Nitrate was not formed in the acid sediments from soft-water lakes. However, in calcareous sediments from hard-water lakes, nitrification proceeded readily when the systems were stirred to increase oxygen diffusion. Nitrate did not accumulate when the samples were not stirred. Experiments with N-Serve indicated that autotrophic organisms were mainly responsible for nitrification in the Lake Mendota samples. Considering the high oxygen diffusion rate required for nitrification in sediments, it is likely that this process occurs only at the sediment-water interface in oxygenated waters.--Copyright 1972, Biological Abstracts, Inc.

LENGTH-WEIGHT RELATIONSHIP AND CONDITION FACTORS OF FISHES FROM A SOUTH CAROLINA RESERVOIR RECEIVING THERMAL EFFLUENT,
Savannah River Ecology Lab., Aiken, S.C.
D. H. Bennett.
Prog Fish-Cult, Vol 34, No 2, p 85-87, 1972, Illus.
Identifiers: Effluents, Fish, *Length-weight ratios (Fish), Lepomis-macrochirus, Pomoxis-nigromaculatus, Reservoirs, *South Carolina, *Thermal effluents, *Bluegill, *Black crappie.

Length-weight relationships and coefficients of condition were compared for bluegill (Lepomis macrochirus) and black crappie (Pomoxis nigromaculatus) collected at the entrance of a thermal effluent into a South Carolina reservoir with those from another part of the reservoir at ambient temperatures. Black crappies from the heated station were significantly heavier and of better body condition than crappies living at ambient temperatures. Fingerling bluegills at the heated station exhibited significantly lower condition factors than those from the control stations. Thermal effluents will not necessarily alter the body condition of fishes living in receiving waters provided cooler refuge sites are available.--Copyright 1972, Biological Abstracts, Inc.

HYDROSTATIC PRESSURE IN RELATION TO THE SYNCHRONOUS CULTURE OF ALGAE IN OPEN AND CLOSED SYSTEMS,
Guelph Univ. (Ontario). Dept. of Botany.
H. Lue-Kim.
Int Rev Gesamten Hydrobiol. Vol 56, No 6, p 873-921. 1971.
Identifiers: *Algae, *Carbon dioxide, *Chlorella-Ellipsoidea, Cultures, *Hydrostatic pressure, Oxygen, Pressure, Synchronous cultures, Warburg effect.

Synchronous cultures of Chlorella ellipsoidea were maintained in an open system using conventional culture techniques. Under identical growing conditions but in a closed system designed to investigate hydrostatic pressure effects on synchronous algal cultures, synchronous cell division was not maintained. The most significant difference in the culture conditions between the open and the closed systems was the concentration of CO2 and O2 which remained relatively constant throughout the growth cycle in the open system, but varied continously during the cycle in the closed system. In the closed system O2 increased and CO2 decreased during the light period; in the dark the reverse was true. In order to investigate the effects of hydrostatic pressure on the physiology and morphology of algae, it was first essential to develop techniques for successful culture of algae in the closed system. Various modifications of culture conditions were made to obtain equal growth in both systems. The n number and ratios of increase in dry weight and protein were 4.0 in the open system but never more than 2.0 in the closed system. Results indicated that high O2 might be responsible for the discrepancies in the n number and ratios of increase of the other growth criteria between the open and closed systems. Photosynthetically evolved O2 in the closed system during the light period might be sufficient to cause the Warburg Effect. Possible ways of solving the problem of gas exchange in the closed system, and in overcoming the Warburg Effect were suggested. Both pressure and O2 concentration interact to influence the division of cells.--Copyright 1973, Biological Abstract, Inc.

HANDBOOK OF FISH DISEASES FOR VETERINARIANS AND BIOLOGISTS,
E. Amlacher.
Veb Gustav Fischer Verlag: Jena, East Germany. 1972. 2nd Ed. 378 p, Illus.
Identifiers: *Bacteria, Biologists, Book, Crabs, Diseases, *Fish diseases, Helminths, Pathology, Protozoans, Veterinarians, *Viruses (Fish).

Important data are presented on diseases of inland fish, including etiology, pathogenesis, epidemiology, pathological histology, histochemistry, therapy and prophylaxis. These diseases include viruses, bacterioses, mycoses, protozoonoses, helminthoses and those caused by dinoflagellates and parasitic crabs. Environmental factors are also covered. Examination techniques for each disease group and methods for shipping are discussed. A diagnostic chart lists symptoms, diseases and control measures. A subject index and bibliography are included.--Copyright 1973, Biological Abstracts, Inc.

METABOLIC EFFECTS OF PCB (POLYCHLORINATED BIPHENYLS) ON THE BROWN TROUT (SALMO TRUTTA),
Salmon Research Inst., Alvkarleo (Sweden).
N. Johansson, A. Larsson, and K. Lewander.
Comp Gen Pharmacol. Vol 3, No 11, p 310-314, 1972.
Identifiers: Anemia, *Brown trout, Cholesterol, Enlargement, Glycemia, Glycerides, Hyper, Liver, Salmo-trutta, *Trout (Metabolism), *Polychlorinated biphenyls.

Brown trout were given a total of 10 microgram PCB/g body-weight. The effects on different metabolites in blood, liver, and muscle were studied after 43 and 203 days. During the first 43 days the fish were fed. On day 43 the PCB-treated trout showed blood anemia, hyperglycemia, enlargement of the liver, and altered cholesterol metabolism. Between 43 and 203 days the fish were subjected to 4 mo. starvation followed by a refeeding period. On day 203 the PCB-treated trout showed higher body-weights, lower muscle glycogen levels, and a more pronounced decrease in liver triglycerides.--Copyright 1973, Biological Abstracts, Inc.

DDT RESIDUES IN WHITE CROAKERS,
California State Dept. of Fish and Game, Sacramento.
W. T. Castle, and L. A. Woods, Jr.
Calif Fish Game. Vol 58, No 3, p 198-203. 1972.
Identifiers: Croakers, *DDT residues, Genyonemus-Lineatus, *White croakers.

The level of DDT residues in white croaker (Genyonemus lineatus) flesh (group A) and flesh with the skin left on (group B) was determined by gas liquid chromatography. The percent fat in group A and group B also was determined. There were significant differences ($P < .01$) between levels of DDT and between the percent fat in the 2 groups. The fat determined for group A was 3.76% (SE ± 0.37%) and for group B was 6.06% (SE ± 0.48%). The total DDT residue (including pp'DDT, its metabolites and isomers) for group A was 10.82 ppm (SE ± 0.96 ppm) and group B was 18.23 ppm (SE ± 1.95 ppm). The only residues detected at the limit of detection of 0.01 ppm were 1,1-dichloro-2-(o-chlorophenyl)-2- (p-chlorophenyl)ethane, (op'DDE); 1,1,1-trichloro-2- (o-chlorophenyl-2-(p-chlorophenyl)ethane, (op'DDT);1,1-dichloro-

2,2-bis (p-chlorophenyl)ethane, (pp'DDD); and 1,1,1-trichloroy2,2-bis (p-chlorophenyl)ethane, (pp'DDT). Many of the samples analyzed exceeded USA Food and Drug administration guideline tolerance of 5.0 ppm wet weight for total DDT.—Copyright 1973, Biological Abstracts, Inc.

THE NITROGEN CYCLE IN SEDIMENT--WATER SYSTEMS,
Wisconsin Univ., Madison. Dept. of Soil Science.
D. R. Keeney.
Journal of Environmental Quality, Vol 2, No 1, p 15-29, January-March 1973. 6 fig, 6 tab, 188 ref.

Descriptors: *Reviews, *Aquatic productivity, *Sediment-water interfaces, *Nitrogen cycle, Euthrophication, Environmental effects, Cycling nutrient, Nitrification, Dentrification, Nitrogen fixation, Water quality, Ecosystems, Algae, Bacteria, Biomass, Nitrogen, Sediments, Water temperature, Cyanophyta, Anabaena, Aquatic soils, Mineralogy, Soil properties, Lake morphology, Hydrogen ion concentration, Dissolved oxygen, Oxidation-reduction potential, Nutrients, Lakes, Electrodes, Respiration, Bacteria, Plankton, Incubation, Pseudomonas.
Identifiers: Mineralization, Immobilization, Ammonification, Nutrient interchange, Fate of pollutants, Anerobic respiration, N-15, Lake Mendota, Bantam Lake, Green Lake, Lake Kinneret, Nitrobacter, Bacillus, Achromobacter, Micrococcus, Nitrosomonas europea, Clostridium pasteurinnum.

The available literature on the fate of nitrogen in waters and sediments is reviewed. Emphasis is placed on the importance of N to aquatic productivity, the pathways leading to N gains or losses in aquatic ecosystems, and the availability of N in sediments to the overlying waters. Important biological reactions include N mineralization and immobilization, nitrification and denitrification, and N fixation. The effect of sediment properties, lake morphology and environmental factors)pH, temperature, dissolved oxygen, oxidation-reduction) on the pathways and rates of N turnover are considered. The mixing process in sediments appear to be the most important in releasing sediment-N to waters. Several facets of the N cycle in waters and sediments require further elucidation. Research needs are outlined. (Mortland-Battelle)

CARBON CYCLE IN SEDIMENT-WATER SYSTEMS,
National Environmental Research Center, Corvallis, Oreg.
P. C. Kerr, D. L. Brockway, D. F. Paris, and S. E. Craven.
Journal of Environmental Quality, Vol 2, No 1, p 46-52, January/March 1973. 1 fig. 72 ref.

Descriptors: *Reviews, *Carbon cycle, *Aquatic environment, *Sediment-water interfaces, *Aquatic microorganisms, Carbon dioxide, Sinks, Ecoystems, Adsorption, Sediments, Anaerobic bacteria, Aerobic bacteria, Algae, Aquatic productivity, Cycling nutrients, Aerobic conditions, Anaerobic conditons, Biodegradation, Path of pollutants, Secondary productivity, Carbon, Nutrients, Organic matter, Nitrogen, Phosphorus, Sorption, Clay minerals, Fungi, Yeasts, Phosphates, Carbonates, Primary productivity, Hydrogen ion concentration, Methane, Photosynthesis, Benthos, E. coli, Bioindicators, Degradation (Decomposition), Organic acids, Sedimentation, Metabolism, Bicarbonates, Bottom sediments.
Identifiers: Nutrient interchange, Mineralization, Heterotrophy, Organic carbon, Substrate utilization, Autotrophic nutrition, Heterotrophic nutrition.

Literature relevant to the extent and rate of carbon exchange between sediment and water is reviewed and the general implication of the role of carbon in regulating biological activity is discussed. Several conclusions are drawn from the review. The extent of adsorption of organics to clay minerals in natural aquatic ecosystems is not known. Sorption, desorption, sedimentation, and aerobic and anaerobic activity are affected by physical factors such as depth and mixing. Certain data indicate that organisms cannot utilize organic material sorbed to clay minerals; other data indicate that growth of certain bacteria and yest is stimulated by the addition of clay minerals. Although the exact substrate (s) is not known, aerobic and anaerobic decomposition of organic materials occurs in and on sediments. Aerobic decomposition seems to result in three different reactions affecting sediment-water carbon exchange: (1) Methane gas is produced and released from sediments. (2) Organic acids produced by anaerobes can serve as carbon sources for aerobes as well as aiding in solubilization of carbonates and affecting sorptive processes. (3) Carbon dioxide produced by anaerobes may be combined in some manner and remain in the sediments. The fact that most deep sediments retain organic carbon indicates that sediments may be sinks for organics. Possibly sediments serve as organic carbon sinks simply because the rate of sedimentation exceeds the rate of decomposition. (Mortland-Battelle)

COMMUNITY STRUCTURE OF THE BENTHOS IN SCOTTISH SEA-LOCHS. II. SPATIAL PATTERN,
Dunstaffnage Marine Research Lab., Oban (Scotland).
J. Gage, and A. D. Geekie.
Marine Biology, Vol 19, No 1, p 41-53, March 1973. 6 fig, 5 tab, 23 ref.

Descriptors: *Spatial distribution, *Benthos, *Biological communities, *Benthic fauna, *Distribution patterns, Statistical methods, Environmental effects, Brackish water, Water sampling, Nematodes, Oligochaetes, Annelids, Copepods, Invertebrates, Data processing.
Identifiers: Data interpretation, *Macroinvertebrates, Epifauna, Infauna, Peloscolex benedeni, Aristias neglectus, Nereimyra punctata, Fabriciola baltica, Polydora quadrilabata, Thyasira flexuosa, Calanus finmarchicus, Aricidea catherinae, Terebellides stroemi, Paraonis lyra, Arcturella dilatata, Prionospio malmgreni, Sphaerosyllis bulbosa, Diplocirrus glaucus, Parvicardium ovale, Capitomastus minimus, Melinna palmata, Pholoe minuta, Prionospio cirrifera, Pherusa plumosa, Scalibregma inflatum, Paraonis gracilis, Spriorbis, *Loch Etive (Scotland), *Loch Creran (Scotland).

Spatial pattern in the distribution of the macrobenthos was studied from series of van Veen grab samples taken in a systematic pattern in Lochs Etive and Creran, W. Scotland. Each series was collected in a circular pattern at 7 stations. Plots of the variances of the numerical occurrences of the species in the samples against their means revealed greater deviation from the random expectation in the case of the 2 muddy sand stations than for the soft-mud stations, with only 1 exception. Two tests of goodness-of-fit to the Poisson distribution were also applied. The degree of concordance between the 3 measures of nonrandomness applied was measured. The best correlation was found between values of the ratio of variance: mean and the test statistic D of the Kolmogorov-Smirnov goodness-of-fit test. It was not possible to discuss the biological basis for the pattern measured, except for a few species shown to be markedly aggregated. No clear trend emerged from attempts to detect differences in pattern with various ecological groupings of the macrobenthos. However, from the use of the test values as sample statistics illustrative of overall community pattern, it was possible to conclude that the fauna of the shallow, usually current-swept areas of muddy sand in the sea-lochs investigated was more aggregated than that on the usually deeper, soft-mud sediments in quieter water. (See also W73-08431) (Holoman-Battelle)

UPTAKE OF MERCURY BY CAGED RAINBOW TROUT (SALMO GAIRDNERI) IN THE SOUTH SASKATCHEWAN RIVER,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. F. Uthe, F. M. Atton, and L. M. Royer.
Journal of the Fisheries Research Board of Canada, Vol 30, No 5, p 643-650, May 1973. 1 fig, 4 tab, 10 ref.

Descriptors: *Mercury, *Absorption, *Rainbow trout, Water pollution effects, *On-site tests, *Canada, Bioindicators, Chemical analysis, Heavy metals.
Identifiers: *Biomonitoring, Methylmercury, Liver, Kidneys, Sample preservation, Atomic absorption spectrophotometry, Animal tissues, Salmo gairdneri, *South Saskatchewan River, Diefenbaker Lake, Pike Lake, Tobin Lake.

Rainbow trout were held in cages in the South Saskatchewan River to assess mercury uptake following curtailment of mercury discharges to the river. Six fish were taken from the cages at random at 2-week intervals and pooled homogenate samples were taken from the livers, kidneys, and headless, dressed carcasses. The total mercury content of samples was determined by flameless atomic absorption spectroscopy. There was a rapid uptake of mercury by the fish during the first warm summer period (1970) with mnutrients uch less uptake during the rest of the year. A second summer experiment (1971) produced no significantly different results suggesting that a long-term contamination exists within this river system. Analyses showed that the bulk of mercury present

in the fish carcasses was present as methylmercury. It was concluded that caged fish are good monitors of mercury pollution. The studies also showed that the cessation of mercury discharge into a river does not lead to elimination of mercury uptake in fish. (Mortland-Battelle)
W73-12857

SOME SHORT-TERM INDICATORS OF SUBLETHAL EFFECTS OF COPPER ON BROOK TROUT, SALVELINUS FONTINALIS,
National Water Quality Lab., Duluth, Minn.
R. A. Drummond, W. A. Spoor, and G. F. Olson.
Journal of the Fisheries Research Board of Canada, Vol 30, No 5, p 698-701, May 1973. 2 tab, 8 ref.

Descriptors: *Copper, *Toxicity, *Brook trout, *Fish behavior, *Bioindicators, *Laboratory tests, Water pollution effects, Monitoring, Lethal limit, Food habits, Bioassay.
Identifiers: *Pollutant effects, Cough frequency, Locomotor activity, Salvelinus fontinalis.

Laboratory tests were conducted to evaluate changes in cough frequency, locomotor activity, and feeding behavior as possible short-term indicators of the long-term effects of copper on brook trout. The trout were studied in plastic electrode chambers that allowed free movement in continuously flowing water. The electrodes measured respiratory and other movements, which were recorded on a polygraph. The effect of copper on coughing was measured by comparing cough frequency during a 24-hour exposure to that during the preceding 24-hour period. The effect on locomotor activity was measured during the first 2 hours of exposure and compared with activity the day before the test and with that of controls. Feeding behavior was monitored at 2 and 24 hours after exposure began and any departure from normal aggressive feeding patterns was recorded. Changes occurred in all three activities at copper concentrations near 9.5 micrograms/1. Each response thus showed promise as a short-term indicator of the concentration range at which chronic exposure might have no permanent effect. Cough frequency was the best of the three for showing stress acccording to the copper concentration, but the change developed more slowly than in locomotor activity. (Mortland-Battelle)

IDENTIFICATION OF THE LIMITING NUTRIENT AND SPECIFIC GROWTH RATE,
Ohio State Univ., Columbus.
R. M. Sykes.
Journal Water Pollution Control Federation, Vol 45, No 5, p 888-895, May 1973. 3 fig, 1 tab, 11 ref.

Descriptors: *Cultures, *Mathematical models, *Growth rates, *Microorganisms, *Limiting factors, *Essential nutrients, *Theoretical analysis, Kinetics, Nutrient requirements.
Identifiers: Chemostat, Batch cultures, Continuous cultures, Culture media, Monod model.

The simplest mathematical theory of continuous microbial cultures, that for the chemostat, contains the corollary that a given growth medium may contain more than one limiting nutrient. If it does, in chemostat cultures each nutrient is limiting in a different, nonoverlapping dilution rate range, and in batch cultures each nutrient limits in different growth stages. It is possible to derive from the differential equations describing the microbial culture both the conditions permitting multiple limiting nutrients and the boundaries of each nutrient's range of limitation. These deductions are a consequence of defining the limiting nutrient as the nutrient that controls the organism's specific growth rate. Deductions can be derived for any model of microbial culture. (Mortland-Battelle)

BENTHIC INVERTEBRATES IN LAKE ASHTABULA RESERVOIR, NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. J. Peterka.
Am Midland Nat. Vol 88, No 2, p 408-418, 1972.
Identifiers: *Benthic invertebrates, Lakes, *North Dakota (Lake Ashtabula), Reservoirs, *Eutrophic lakes.

The kinds and amounts of benthic invertebrates in Lake Ashtabula, a 20-yr-old eutrophic reservoir in southeastern North Dakota, were recorded at a single station located 3.2 km N of the dam. The average standing crops of benthic invertebrates in the sampling station collected during April, June and Aug. 1967 were 6.4, 8.2 and 7.1 g m-2, respectively, and 1831, 2622 and 1295 individuals m-2. Organisms in the 0-3 m depth zone accounted for 28% by number and 53% by weight of all organisms present in the study area from April to Aug; 56% by number and 37% by weight were in the 3-8 m depth zone; and 16% by number and 9% by weight were in the 8-12 m depth zone. The quantity and kinds of its benthic invertebrates indicate Lake Ashtabula is eutrophic when compared with data available from other lakes that are also unstratified during open-water periods.--Copyright 1973, Biological Abstracts, Inc.

SOME EFFECTS OF EVAPORATION SUPPRESSION ON RESERVOIR ECOLOGY,
North Texas State Univ., Denton. Dept. of Biological Sciences.
J. K. G. Silvey, H. B. Sharp, K. L. Dickson, R. C. Allison, and J. C. Stiles.
Journal of the American Water Works Association, Vol 65, No 4, p 260-268, April 1973. 12 fig, 4 tab, 24 ref.

Descriptors: *Aquatic algae, *Aquatic insects, *Reservoirs, *Evaporation control, *Hexadecanol, *Water quality, Aquatic bacteria, *Annelids, *Benthos, Aquatic fungi, Freshwater fish, Monomolecular films, Midges, Color, Specific conductivity, Pseudomonas, Diptera, Water sampling, Turbidity, Tubificids, Phosphates, Nitrates, Conductivity, Hydrogen ion concentration, Carbonates, Bicarbonates, Sulfates, Chlorides, Dissolved oxygen, Carbon dioxide, Pyrrophyta, Iron, Cultures, Gas chromatography, Water temperature, Dinoflagellates, Surface tension, Calcium, Hardness (Water), Chlorophyta, Cyanophyta, Chrysophyta, Mayflies, *Oklahoma.
Identifiers: Standard methods, Bacillus, Macroinvertebrates, *Lake Hefner (Okla), Kids Lake, Actinomycetes, Alcaligenes, Flavobacterium, Brevibacterium, Hexagenia.

Studies were made in Lake Hefner, an Oklahoma City water supply reservoir, to determine the effects of hexadecanol on biological, chemical, and physical aspects of water quality. Hexadecanol is a chemical applied to suppress evaporation. Samples were taken twice a week from five stations during summer months and analyzed for bacteria, algae, phosphates, and nitrates. Chemical and physical analyses for hardness, temperature, specific conductance, pH, carbonates, bicarbonates, sulfates, chlorides, DO, CO2, iron, color and turbidity were performed weekly. During winter months, monthly samples were analyzed in a like manner. The study was conducted over a 5-year period. The application of hexadecanol apparently had no detectable deleterious effect on chemical water quality. Some stimulation in the population of certain bacterial organisms could be seen, but only when a composite was made of all data from each station. A slight correlation could also be made between laboratory studies and the organisms shown to be stimulated in the reservoir. But since other conditions may have had an effect, it was not possible to conclude that population increases were due entirely to hexadecanol. There was no apparent difference in bottom fauna between periods of coverage and non-coverage. It was concluded that hexadecanol in the concentrations used had no detectable effect on the ecology of the reservoir. (Mortland-Battelle)

PHYSIOLOGICAL CHANGES IN MYTILUS EDULIS L. INDUCED BY TEMPERATURE AND NUTRITIVE STRESS,
Leicester Univ. (England). Dept. of Zoology.
B. L. Bayne.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 1, p 39-58, February 1973. 9 fig, 7 tab, 27 ref.

Descriptors: *Thermal stress, *Animal physiology, *Laboratory tests, *Physiological ecology, *Environmental effects, Nitrogen, Animal metabolism, Water temperature, Mussels, Mollusks, Invertebrates, Water pollution effects, Ammonia, Bioassay, Proteins, Carbohydrates, Lipids, Summer, Autumn, Winter.
Identifiers: *Nutritive stress, Seasonal variation, Oxygen consumption, Excretion, Blood, Metabolites, Sugars, alpha-Amino nitrogen, Macroinvertebrates.

The results of the determination of oxygen consumption, nitrogen excretion (both as ammonia-N and alpha-amino-N) and of the concentration of blood metabolites in Mytilus edulis are described in relation to seasonal cycle and to changes induced by temperature and nutritive stress in the laboratory. Four routine stress experiments were set up using 100 animals of uniform length per experiment in aquaria with re-circulating seawater. Three levels of oxygen consumption rate were identified, viz. standard, routine and active. Animals fed above the maintenance energy requirement adjust their oxygen consumption rate to a routine level. Animals fed below the maintenance requirement reduce their oxygen consumption rate to a standard level within 35-40 days. The routine rate is seasonally variable, with high values in the winter and low values in the summer. The standard rate also varies seasonally. The exponent that relates oxygen consumption to body size varies from a high value in the summer to a lower value in the winter. Rates of excretion of ammonia-N and alpha-amino-N vary seasonally from high values in winter to low values in summer. Significant amounts of alpha-amino-N are lost from the body at all times, and especially during stress. In unstressed animals the atomic ratio of oxygen consumed to ammonia-N excreted remains at about 100 for most of the year, but rises to much higher values in the summer. The relationship observed in the ON values under stress suggests that the O:N ratio is a sensitive index of nutritive stress in Mytilus. Changes in blood sugars were interpreted in terms of an index of blood sugar energy reserve, which varies with stress. Temperature and nutritive stress is seen to alter seasonal steady-state values of physiological indices. New steady states are established as a result of stress, and the measured shifts in these indices provide estimates of the physiological effects of environmental change. (Holoman-Battelle)

THE MECHANISMS OF NITROGEN ASSIMILATION IN PSEUDOMONADS,
Newcastle-upon-Tyne Univ. (England). Dept. of Microbiology.
C. M. Brown, D. S. Macdonald-Brown, and S. O. Stanley.
Antonie van Leeuwenhoek, Vol 39, No 1, p 89-98, 1973. 4 fig, 2 tab, 17 ref.

Descriptors: *Nitrogen, *Aerobic bacteria, *Cultures, *Enzymes, Nitrates, Nutrient requirements, Deficient elements, Environmental effects, Marine bacteria, Path of pollutants, Ammonia, Temperature, Hydrogen ion concentration, Assay.
Identifiers: *Assimilation, *Pseudomonads, *Substrate utilization, Enzymatic activity, Pseudomonas aeruginosa, Pseudomonas fluorescens, Chemostat, NAD, NADP, Glutamine synthetase, Glutamate dehydrogenase, Psychrophilic bacteria, L-glutamine: 2-oxoglutarate aminotransferase, Culture media, Glutamate, Fate of pollutants.

Pseudomonas aeruginosa, Ps. fluorescens and 3 marine psychrophylic pseudomonads were grown in chemostat cultures with nitrate ammonia or glutamate as nitrogen source. In cultures grown on nitrate (either carbon- or nitrogen-limited) and in ammonia nitrogen-limited cultures ammonia was assimilated via the glutamine synthetase/L-glutamine: 2-oxoglutarate aminotransferase (GS/GOGAT) pathway. With an excess of ammonia in the culture however ammonia was assimilated via glutamate dehydrogenase (GDH), and glutamine synthetase (GS) was either present only at low levels or absent. Two distinct GDH activities were detected in all 5 bacteria, one specific to NAD and one to NADP. The presence of these activities was determined by the environment in which cells were grown. These activities showed differences with respect to substrate affinity (Km values) for ammonia, incubation temperature and to a lesser extent pH and may involve separate GDH isoenzymes. GS from the marine bacterium PL sub 1 had a very high affinity for ammonia (Km of 0.3 mM) but a low affinity for glutamate (Km of 9 mM). (Holoman-Battelle)

THE UTILIZATION OF LEAF LITTER BY STREAM DETRITIVORES,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
K. W. Cummins, R. C. Petersen, F. O. Howard, J. C. Wuycheck, and V. I. Holt.
Ecology, Vol 54, No 2, p 336-345, Early Spring 1973. 3 fig, 9 tab, 27 ref.

Descriptors: Animal growth, *Mortality, Aquatic insects, *Laboratory tests, Natural streams, *Secondary productivity, Hickory trees, Caddisflies, Stoneflies, Immature growth stage, Mayflies, Standing crops, Aquatic fungi, Diptera, Larvae, Growth rates, Decomposing organic matter.
Identifiers: *Detritivores, *Leaf litter, *Heterotrophic nutrition, Dissolved organic matter, Particulate organic matter, Flies, Species density, Food conversion, Carya glabra, Pignut hickory, Lunulospora curvula, Crane flies, Tipula abdominalis, Tipula caloptera, Pycnopsyche lepida, Pycnopsyche guttifer, Pycnopsyche scabripennis, Pteronarcys pictetii, Stenonema fuscum, Stenonema tripunctatum, Stenonema interpunctatum, Stenonema canadense, Substrate utilization, Stenonema spp, Tipula spp, Pycnopsyche luculenta, Pteronarcys scotti, Stenonema pulchellum, Neiophylax concinnus.

Investigations of large and fine particle feeding detritivores (shredders and collectors) fed on conditioned hickory leaves (Carya glabra) revealed density-dependent intra- and interspecific interactions. Shredder (Tipula and Pycnopsyche) growth rates ranged from 0.47 to 1.53 percent increase in body wt/day depending upon density, species combinations, and culture temperature. Collector (Stenonema) growth rate ranged from 0.13 to 1.80 percent body wt/day, being greatest at high densities, particularly in combination with shredders. Food consumption ranged from 15.7 to 33.2 percent body wt/day for shredders and 4.0 to 23.2 percent body wt/day for collectors. After non-shredder feeding losses are accounted for, estimated shredder standing crop required to account for processing of reported leaf litter inputs compare generally to measured shredder standing crop. DISPERSION, DISPERSAL, AND PERSISTENCE OF THE ANNUAL INTERTIDAL ALGA, POSTELSIA PALMEFORMIS RUPRECHT,
Scripps Institution of Oceanography, La Jolla, Calif.
P. K. Dayton.
Ecology, Vol 54, No 2, p 433-438, Early Spring 1973. 3 fig, 1 tab, 9 ref.

Descriptors: *Phaeophyta, *Intertidal areas, *Ecological distribution, *Persistence, Dispersion, Marine algae, Competition, Succession, Crustaceans, Biological communities, *Washington, Mussels, Invertebrates, Annual, Distribution patterns.
Identifiers: *Postelsia palmaeformis, *Colonization, Mytilus californianus, Species interaction, Chthamalus dalli, Balanus glandula, Balanus cariosus, Pollicipes polymerus, Gooseneck barnacle, Acorn barnacle, Macroinvertebrates.

Postelsia palmaeformis is an annual brown alga that occurs on the Washington coast at upper intertidal sites subjected to extreme wave exposure. The alga occurs in patches within beds of Mytilus californianus, the competitive dominant in this region. Postelsia sporophytes are shown to colonize experimentally cleared spaces in beds of Mytilus with no concurrent colonization of adjacent uncleared controls. However, unlike many annual algae which have high spore dispersal abilities, Postelsia seems to have an effective distance of sporophyte colonization also. Postelsia patches are maintained through time by settlement of Postelsia on other algal and animal species. By increasing the probability of both being ripped from the substratum, and by overgrowing and smothering barnacles, Postelsia sporophytes clear primary substratum for the eventual use of sporophytes of their own species. THE USE OF FISH AS SENSORS IN INDUSTRIAL WASTE LINES TO PREVENT FISH KILLS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies; and Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. Cairns, Jr., R. E. Sparks, and W. T. Waller.
Hydrobiologia, Vol 41, No 2, p 151-167, March 29, 1973. 5 fig, 7 tab, 10 ref.

Descriptors: *Industrial wastes, *Toxicity, *On-site data collections, *Water pollution effects, *Methodology, Movement, Bioindicators, Automatic control, Effluents, Water pollution control, Fish populations, Sunfishes, Fishkill, Water pollution, Zinc, Freshwater fish, Data collections, Sampling, Industrial plants, Water quality control.
Identifiers: *Bluegills, *Biomonitoring, Breathing, Minicomputers, Continuous flow system, Lepomis macrochirus, Data interpretation.

The use of movements and breathing rates of bluegill sunfish as in the detection of sublethal concentrations of zinc can be applied to industrial waste lines. Fish movement patterns and breathing rates would be monitored according to methods described in previous papers. Since industrial waste and water qualities are apt to vary unpredictably, a redundant detection system is desirable. If that monitoring system were automated the rate of data acequisition and analysis could be greatly speeded up. At an actual industrial site, a monitoring unit would be located on each waste stream in the plant and on the combined waste stream. The experimental fish in each unit would be exposed to waste diluted with water from the river above the plant, and control fish would be exposed to upstream water alone. The information from each monitoring unit could be analyzed by a central data processor, and when there was a warning response, the industry could tell which waste stream wa s at fault. If the problem was outside the plant, the control fish would show responses. It is likely that 'fish sensors' in continuous monitoring units at industrial sites can warn of developing toxic conditions in time to forestall acute damage to the fish populations in streams. ARTIFICIAL RESERVOIR DESTRATIFICATION EFFECTS ON PHYTOPLANKTON,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Div. of Forestry and Wildlife Science.
R. T. Lackey.
Journal Water Pollution Control Federation, Vol 45, No 4, p 668-673, April 1973. 3 fig, 1 tab, 15 ref.

Descriptors: *Phytoplankton, *Reservoirs, *Environmental effects, *Aeration, Chlorophyta, Cyanophyta, Sampling, Pyrrophyta, Aquatic algae, Diatoms, Chlorophyta, Distribution patterns, Plant populations, Dinoflagellates.
Identifiers: *Thermal destratification, Vertical distribution, Sample preservation, Volvox, Mallomonas, Seasonal variation, Eudorina elegans, Sphaerozosoma aubertianum, Staurastrum gracile, Ceratium hirundinella, Asterionella formosa, Fragilaria crotonensis, Melosira granulata, Anabaena flos-aquae, Aphanizomenon flos-aquae, Gomphosphaeria lacustris.

A 19-ha Colorado montane reservoir was kept thermally destratified by continuous aeration for 1 yr. Samples were taken on a single day near the middle of each month from five permanently marked stations and consisted of four 3-liter hauls taken at each 0.5-m depth within each 2-m stratum. Samples were strained through a 75-mm mesh net, preserved in 4 percent formaldehyde, and enumerated in Palmer counting cells. Individual plankters were enumerated where practical, but colonies and chains were also treated as individuals. Statistical methods were used in analyzing the results. Total phytoplankton abundance was reduced, but phyla varied in their response. Green phytoplankton (Chlorophyta) decreased in abundance and diatoms (Bacillariophyceae) were nearly eliminated during destratification. Blue-green algae (Cyanophyta), however, increased in abundance and this phenomenon may limit the use of destratification in water management. Vertical distribution of phytoplankton was not affected by destratification. (Mortland-Battelle)

EFFECT OF INCUBATION TEMPERATURE ON THE MACROMOLECULAR AND LIPID CONTENT OF THE PHYTOFLAGELLATE OCHROMONAS DANICA,
Queens Coll., Flushing, N.Y. Dept. of Biology.
S. Aaronson.
Journal of Phycology, Vol 9, No 1, p 111-113, March 1973. 4 tab, 17 ref.

Descriptors: *Cytological studies, *Thermal stress, *Environmental effects, Proteins, Lipids, Aquatic algae, Carbohydrates, Biomass, Thermal pollution, Cultures, Incubation, Water pollution effects, Growth rates, Chlorella, Eutrophication, Food chains, Degradation (Decomposition), Temperature, Chrysophyta.
Identifiers: *Ochromonas danica, *Chemical composition, RNA, Culture media.

Ochromonas danica grown in a chemically defined medium under controlled conditions at different incubation temperatures showed marked changes in chemical composition and secretory pattern. As the incubation temperature rose from 15 to 30C, the cell number per unit volume of medium increased; the cell mass reach a maximum and then declined slightly, and the weight per single cell decreased. The chemical composition of the cells changed with increasing temperature: carbohydrates decreased dramatically; proteins quadrupled at 20C and then declined 25 percent; lipids increased to about 40 percent of maximum at 30C. The extracellular secretion by the cells of carbohydrates seemed to increase and then decline; RNA decreased; proteins increased; and lipids remained approximately constant, as the temperature increased. Increased oxygen utilization in the decay process that may result from these changes and lower oxygen solubility in warmer waters may well enhance the eutrophication process already rampant in much of the aquatic environment. On the other hand, knowledge of the ecological changes produced by thermal pollution at the primary food chain level may permit the exploitation of this pollutant for aquaculture. (Moreland-Battelle)

SWIMMING PERFORMANCE OF YOUNG ATLANTIC SALMON (SALMO SALAR) AS AFFECTED BY REDUCED AMBIENT OXYGEN CONCENTRATION,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
M. N. Kutty, and R. L. Saunders.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 223-227, February 1973. 3 fig, 14 ref.

Descriptors: *Atlantic salmon, *Oxygen sag, *Fish behavior, *Swimming, *Juvenile fish, *Laboratory tests, *Water pollution effects, Dissolved oxygen, Bioassay, Smolt, Tilapia, Cechlids, Rainbow trout, Freshwater fish, Fish physiology, Water quality standards, Oxygen requirements, Cold-water fish.
Identifiers: Salmo salar, Salmo gairdneri, Carassius auratus, Goldfish.

As oxygen concentraion is lowered, a point is reached, the critical oxygen level, at which juvenile Atlantic salmon (salmo salar) stop swimming in a tunnel respirometer. At concentrations just above the critical level, salmon frequently lose position in the upstream end of the respirometer and fall back to the downstream end while still headed into the current. There appears to be a progressive decrease in locomotor activity, indicated by reduced tailbeat frequency, on approaching the critical concentration. Swimming performance of the Atlantic salmon is more highly dependent on oxygen concentration than is that of rainbow trout (Salmo gairdneri), goldfish (Carassius auratus), or Tilapia. The critical oxygen level for salmon swimming at 55 cm/sec is about 4.5 mg/liter, in comparison with 2.0 for rainbow trout, 1.7 for goldfish, and 1.0for Tilapia. Between the minimum speed at which a salmon swims steadily and the maximum of which the fish is capable, the critical oxygen level rises with increase in swimming speed. Stoppage of swimming at the critical level is not owing to fatigue; fish resume swimming within minutes of the oxygen level being raised only slightly. The high critical oxygen levels for salmon in relation to other species including rainbow trout, another salmonid, point up the need for maintenance of stringent water quality criteria for oxygen levels in salmon rivers. (Holoman-Battelle)

A RELATIONSHIP BETWEEN HETEROTROPHIC UTILIZATION OF ORGANIC ACIDS AND BACTERIAL POPULATIONS IN WEST BLUE LAKE, MANITOBA,
Manitoba Univ., Winnipeg. Dept. of Botany.
G. G. C. Robinson, L. L. Hendzel, and D. C. Gillespie.
Limnology and Oceanography, Vol 18, No 2, p 264-269, March 1973. 2 fig, 2 tab, 15 ref.

Descriptors: *Organic acids, *Aquatic bacteria, Adsorption, Organic compounds, Water sampling, Cultures, *Canada.
Identifiers: *Substrate utilization, *Heterotrophic nutrition, *Heterotrophic bacteria, Bacterial populations, *Blue Lake (Manitoba), Data interpretation, Plate counts, Lactic acid, Pyruvic acid, Fumaric acid, Malic acid, Acetic acid, Succinic acid, Glycolic acid, Citric acid, Formic acid, Sample preparation, Cytophaga.

The relationship between the concentration of nine organic acid substrates (lactic, pyruvic, fumaric, malic, acetic, succinic, glycolic, citric, and formic) and their velocities of uptake have been investigated in West Blue Lake, Manitoba. Maximum uptake velocities were ranked and compared with bacterial plate counts on minimal media supplemented with single organic acids. Water samples from a 5-m depth were screened through a 153-micron Nitex screen to remove most of the zooplankton. Subsamples were place in an appropriate number of sterile 25-ml bottles and inoculated with the C-14 labeled organic acid substrates. All bottles were incubated in the lake for a 12-hr period at a depth of 5 m. After incubation the samples were filtered through 0.45-micron cellulose acetate filters each of which was washed with sterile water and placed into scintillation vials containing Bray's fluor. Radioactivity was determined in a scintillation counter and calculations were made to determine bacterial numbers in relation to each organic acid. For pyruvic, fumaric, malic, acetic, glycolic, and citric acids an excellent correlation (r equals 0.98) existed between plate counts and acid uptake indicating that for these substrates maximum velocities of uptake are indeed indicative of actual bacterial populations. Identifiers: *Mortality coefficients, Population dynamics, Calanus helgolandicus.

Point estimates of mortality of zooplankton in the field, based on relative numbers of individuals of different developmental stages observed in samples, require either a knowledge of the initial input of young or assumptions about constancy of input and constancy of mortality over adjacent stages. As the initial input is rarely known and the assumptions of constancy are probably often violated, the resulting uncertainty should be made evident in the estimates. This can be done by reporting the ranges of values of the mortality coefficients that would be consistent with the observed relative numbers of individuals. Methods of calculating these ranges are given. (Holoman-Battelle)

THE REDUCTION OF COPPER TOXICITY IN A MARINE COPEPOD BY SEDIMENT EXTRACT,
British Columbia Univ., Vancouver. Inst. of Oceanography.
A. G. Lewis, P. Whitfield, and A. Ramnarine.
Limnology and Oceanography, Vol 18, No 2, p 324-326, March 1973, 1 fig, 7 ref.

Descriptors: *Copper, *Toxicity, *Copepods, *Attenuation, *Bottom sediments, Water pollution effects, *Growth stages, Sediments, Heavy metals, Bottom sampling, Crustaceans, Invertebrates, Sea water, Zooplankton, Water pollution, Larval growth stage, Embryonic growth stage.
Identifiers: *Euchaeta japonica, Survival, Macroinvertebrates, Culture media, Membrane filtration, Eggs, Sample preparation.

Seawater extracts of marine sediments from two areas were added to copper-enriched seawater in which the prefeeding stages (egg, NI, NII) of Euchaeta japonica (Copepoda:Calanoida) were maintained. Sediment samples were collected with an Ekman and a Shipek sampler. A quantity of the sediment was extracted by allowing the sediment to stand in cold, membrane-filtered seawater. The extract was filtered, stored, diluted to 2 percent, and CuC12 and the prefeeding copepod stages were added. Survival through the prefeeding stages was used as an indication of the effects of the sediment extracts. Survival with the sediment extracts was greater than without, indicating an ability of some part of the extracted material to reduce the toxicity of the copper. The effect of the extracts was compared with that of a synthetic chelating agent to provide an 'equivalent' value. (Holoman-Battelle)

THE EFFECTS OF SUBLETHAL CONCENTRATIONS OF WHOLE BLEACHED KRAFTMILL EFFLUENT ON THE GROWTH AND FOOD CONVERSION EFFICIENCY OF UNDERYEARLING SOCKEYE SALMON (ONCORHYNCHUS NERKA),
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.
P. W. Webb, and J. R. Brett.
Journal of the Fisheries Research Board of Canada, Vol 29, No 11, p 1555-1563, November 1972. 5 fig, 1 tab, 19 ref, append.

Descriptors: Water pollution effects, *Juvenile fish, *Bioassay, *Animal growth, *Animal metabolism, Growth rates, Lethal limit, Toxicity, Water temperature, Hydrogen ion concentration, Pulp wastes, Dissolved oxygen, Industrial wastes, Laboratory tests, *Bleaching wastes.
Identifiers: Bleached Kraft mill effluent, *Sockeye salmon, Oncorhynchus nerka, Food conversion.

Changes in growth rate and gross conversion efficiency were measured for underyearling sockeye salmon during and after exposure to full bleached kraftmill effluent (BKME). Five groups of fish were exposed for 56 days to 0, 1.0, 2.5, 10, and 15 percent BKME (v/v). Fresh 24-hr composite effluent at pH 6.8 was used daily after filtering. Growth was followed for a further 56 days after BKME exposure. Temperature was held at 15 C and dissolved oxygen between 90 and 100 percent air saturation. Growth rate and conversion efficiency were unaffected at 1.0 and 2.5 percent BKME. Reduced mean growth rate and conversion efficiency at 10 percent BKME were not statistically significant from controls but were considered to be biologically important in estimating threshold response levels. Significant reductions were found at 25 percent BKME. No recovery in retarded growth was found after exposure to BKME. Condition factor and percentage dry weight were not affected. It was concluded from computed response curves that the EC50 of the effluent was approximately 3.7 percent (v/v). (Holoman-Battelle)

A MATHEMATICAL MODEL OF THE NUTRIENT DYNAMICS OF PHYTOPLANKTON IN A NITRATE-LIMITED ENVIRONMENT,
Utah Water Research Lab., Logan.
W. J. Grenney, D. A. Bella, and H. C. Curl Jr.
Biotechnology and Bioengineering, Vol 15, No 2, p 331-358, March 1973. 9 fig, 2 tab, 34 ref.

Descriptors: *Phytoplankton, *Mathematical models, *Nitrates, *Cycling nutrients, *Deficient elements, Computer models, Absorption, Growth rates, Proteins, Nitrogen, Storage, Kinetics.
Identifiers: Monod model, Chemostat.

A three-compartment mathematical model is presented that represents a phytoplankton population capable of storing nitrogen in a nitrate-limiting environment. Growth rates are represented by saturation kinetics based on the concentrations in intracellular nutrient pools. Nutrient flow through a biological system is described using three forms of intracellular nitrogen (inorganic-nitrogen, organic intermediates, and protein). The three-compartment model was developed as part of a larger model to investigate mechanisms associated with nutrient limitation and recycling. The model demonstrated the changes which may occur in the nitrogenous constituents of a phytoplankton population with time and environmental conditions. The model also demonstrates three phenomena which have been observed in field and laboratory experiments but which are not represented by the customary Monod model: (1) uptake rates may significantly exceed net growth rates, (2) high growth rates may be encountered at very low environmental nitrate concentrations, and (3) the ratio of internal nitrogen to population size may change significantly during a study period. It is suggested that the amount of nitrogen in storage may be used as an indicator of the physiological state of a monospecific population. The one-compartment Monod model was shown to be inadequate to accurately represent population growth in chemostat experiments when intracellular storage is a significant factor. (Mortland-Battelle)

PHOSPHATE CHEMISTRY IN LAKE SEDIMENTS,
Massey Univ., Palmerston North (New Zealand).
J. K. Syers, R. F. Harris, and D. E. Armstrong.
Journal of Environmental Quality, Vol 2, No 1, p 1-14, January-March 1973. 5 fig, 134 ref.

Descriptors: *Phosphates, *Reviews, *Lake sediments, Sorption, Eutrophication, Solubility, Mineralogy, Algae, Oxidation-reduction potential, Cycling nutrients, Sediment-water interfaces, Iron, Manganese, Calcium, Distillation, Aluminum, Chesapeake Bay, Biomass, Scenedesmus, Calcite, Sinks, Epilimnion, Hypolimnion, Phosphorus, Aquatic soils.
Identifiers: *Nutrient interchange, Desorption, Chemical mobility, Organic phosphorus, Hydroxyapatite, Esters, Linsley Pond, Lake Mendota, Bantam Lake.

The amounts and forms of inorganic and organic phosphate (P) in lake sediments are discussed in relation to sediment composition and properties. The ability of noncalcareous and calcareous sediments to sorb and desorb added P in the laboratory and in the lake environment is interpreted in terms of the amounts and reactivities of sediment components involved in the sorption of P; emphasis is placed on the role of an Fe-rich gel complex. Factors controlling the chemical mobility and biological availability of sediment inorganic and organic P are considered. Whether sediments act as a P source or sink is determined by sediment composition and limnological conditions. The factors involved in the interchange of P between the sediment interstitial water and the overlying water column are reviewed. The role of P in lake eutrophication is discussed briefly. ECOLOGICAL STUDIES OF CODIUM FRAGILE IN NEW ENGLAND, USA,
New Hampshire Univ., Durham. Dept. of Botany; and New Hampshire Univ., Durham. Jackson Estuarine Lab.
R. A. Fralick, and A. C. Mathieson.
Marine Biology, Vol 19, No 2, p 127-132, March 1973. 8 fig, 1 tab, 20 ref.

Descriptors: *Ecology, *Marine algae, *Ecological distribution, *Limiting factors, *Plant physiology, Photosynthesis, Maine, Massachusetts, Surface waters, Plant growth, Standing crops, Reproduction, Water temperature, Light intensity, Salinity, Littoral, Germination, *New England, Primary productivity, Water quality.
Identifiers: *Codium fragile, Seasonal variation, Photosynthetic rates, Assimilation.

Because of the abundance of Codium fragile (Chlorophyta) in New England and its economic importance to scallop and oyster industries, a study was made of the factors responsible for its local growth and distribution. Systematic monthly collections and observations of the algal populations were made with SCUBA equipment in the sublittoral zones at each site in Boothbay Harbor, Maine and in Woods Hole and Wing Neck, Massachusetts. Results of the various growth studies conducted were recorded monthly; hydrographic data were correlated with the growth and reproductive studies. It is suggested that C. fragile is a warm-temperate plant that is growing near its northern limits in New England, but one that has not extended to its potential southern limits. (Holoman-Battelle)

SIMULATION STUDY OF PHYTOPLANKTON PHOTOSYNTHESIS AND GROWTH IN THE FRASER RIVER ESTUARY,
British Columbia Univ., Vancouver. Inst. of Oceanography.
M. Takahashi, K. Fujii, and T. R. Parsons.

Descriptors: *Photosynthesis, *Phytoplankton, Plant growth, *Model studies, Limiting factors, *Primary productivity, *Estuarine environment, On-site investigations, Light intensity, Water temperature, Nitrates, Saline water-freshwater interfaces, Salinity, Phosphorus, Estimating, *Canada, Environmental effects, Water quality, Hydrography, Nutrients, Marine algue, Physicochemical properties, Growth rates.
Identifiers: *Fraser Riverestuary (Canada), Chorophyll a, Photosynthetic rates, Data interpretation.

Phytoplankton photosynthesis was estimated by a simulation model of the Fraser River estuary (Canada). For this estimation, two kinds of information were considered; (1) the photosynthetic response of phytoplankton taken from the estuary to each environmental factor; (2) actual measurement of changes in each environmental factor in the estuary. As the major limiting factors, light, intensity, temperature, and nitrate were taken into account. Variations in these parameters were combined together under the assumption of the 'law of the minimum'; that is, only one of the environmental factors was considered to limit photosynthesis at any given time and place. From the results obtained, it could be shown which environmental factors actually limited phytoplankton photosynthesis in the Fraser River estuary at different times of the year and at different depths. PHYTOPLANKTON ALGAE: NUTRIENT CONCENTRATIONS AND GROWTH,
Woods Hole Oceanographic Institution, Mass.
P. Holmes, M. G. Kelly, G. M. Hornberger, and W. J. O'Brien.
Science, Vol 180, No 4092, p 1298-1300, June 1973. 6 ref.

Descriptors: *Phytoplankton, *Growth rates, *Primary productivity, *Nutrient requirements, *Limiting factors, Plant growth, Biomass, Plant populations, Aquatic environment, Aquatic algae, Aquatic plants, Standing crops, Nutrients.
Identifiers: *Growth kinetics, Substrate concentration.

Critiques of and a rebuttal to an article concerned with nutrients and growth of phytoplankton are presented. Some of the more pertinent points made include: (1) Growth yield depends on the concentration of a limiting nutrient and not necessarily on how fast growth can occur. (2) Considering Monod kinetics, nutrient addition will increase both growth rate and final biomass. Phytoplankton growth kinetics should be considered in terms of both standing crop and productivity, nutrient uptake or growth rate. (3) The Liebig thought of nutrient limitation in terms of enhanced yield and experiments which demonstrate only an enhancement of phytoplankton yield without showing a change in population growth rate are not always valid in determining a real limiting factor in the natural system. (Holoman-Battelle)

CHEMISTRY AND TROPHIC STATUS OF SEVEN NEW ZEALAND LAKES,
Department of Scientific and Industrial Research, Taita (New Zealand). Soil Bureau.
R. H. S. McColl.
New Zealand Journal of Marine and Freshwater Research, Vol 6, No 4, p 399-447, December 1972. 28 fig, 12 tab, 58 ref.

Descriptors: *Tropic level, *Heavy metals, *Water quality, *Nutrients, *Chemical analysis,

Limnology, Water analysis, Dissolved oxygen, Silica, Phosphorus, Nitrogen, Sulfates, Diatoms, Copper, Zinc, Water temperature, Alkalinity, Electrical conductance, Phosphates, Hydrogen ion concentration, Chlorophyll, Dissolved solids, Chlorides, Nitrates, Nitrites, Ammonia, Silicates, Iron, Manganese, Sodium, Calcium Potassium, Magnesium, Sampling, Stratification, Ions, Bicarbonates, Lake morphology, Depth, Land use, Regression analysis, Secchi disks.
Identifiers: *New Zealand lakes, Transparency, Atomic absorption spectrophotometry, Pigments, Staurastrum, Cyclotella, Dinobryon.

The chemistry of the surface and bottom waters of seven Rotorua lakes (Okataina, Rotoma, Tikitapu, Okareka, Rotokakahi, Ngapouri, and Okaro) was examined monthly between April 1970 and April 1971 in relation to the biology of the lakes. Twenty-four parameters were measured, including dissolved oxygen, major ions, silica, phosphorus, nitrogen, algal pigments, and some trace elements. All lakes were warm monomictic, second-class lakes. The waters were soft and variations between lakes in composition of major cations and anions appeared to be related to catchment differences. The major cations and C1 ion varied little with season. Sulfate varied seasonally in the hypolimnia of the most productive lakes (Okaro, Ngapouri, and Rotokakahi). Silica was abundant in all lakes, except Tikitapu where diatoms were poorly represented. Depletion of silica by diatom populations was only observed in the two most productive lakes (Okaro and Ngapouri). All lakes except Ngapouri showed anomalous silica distrubution with lower concentrations in the bottom waters at all times. Copper and zinc varied little between lakes and depths, but showed marked peakes during winter circulation. Data acquired from the analyses were used to classify the lakes by trophic level. Algal growth was most vigourous during winter cirulation and in some lakes a related phosphate 'depletion phase' occurred. Nitrate concentrations were low by world standards, except in the most productive lakes during winter circulation. Nitrite occurred irregularly in the surface waters of some lakes and in trace amounts in the hypolimnia of all lakes in late summer. (Little-Battelle)

MARICULTURE IN ESTUARINE OIL--PIPELINE CANALS IN LOUISIANA,
Nicholls State Univ., Thibodaux, La. Dept. of Biological Sciences.
A. H. Harris, R. H. Kilgen, and D. Kraemer.
Available from NTIS, Springfield, Va. 22151 as COM-73-10513 - Price $3.00 printed copy; $1.45 microfiche. Louisiana State University Center for Wetland Resources Sea Grant Preprint, 1973. 8 p, 1 fig, 4 ref. (Paper presented to 4th Annual Meeting and Workshop of the World Mariculture Society, January 24-26, 1973, Monterrey, Mexico).

Descriptors: *Fish physiology, *Oily water, *Estuaries, *Louisiana, *Channel catfish, Growth stages, Water quality, Water pollution sources, Oil industry, Evaluation, Water pollution effects, Canals, Pipelines.
Identifiers: Mariculture studies.

The value of the biological productivity of the Louisiana estuaries is probably diminished by the presence of subsurface mineral deposits in the form of gas, oil, and sulphur. A study has been initiated to determine the suitability of utilizing some of the thousands of acres of estuarine oil-pipeline canals in Louisiana for mariculture purposes. Channel catfish, pompano, and white shrimp are selected test animals. Preliminary catfish culture results are reported. Channel catfish stocked in a 2.55 hectare brackish-water oilfield pipeline canal averaged 323 g after 6 months. Growth rates, water quality, and pathogenic organisms have remained within acceptable parameters. Predation, overbank flooding, and harvesting are the most obvious problems. (Woodard-USGS)
W73-12951

STANDING CROPS OF NATURAL FISH POPULATIONS IN BRACKISH-WATER OIL FIELD PIPELINE CANALS,
Nicholls State Univ., Thibodaux, La. Dept. of Biological Sciences.
R. H. Kilgen, A. H. Harris, and D. Kraemer.
Available from NTIS, Springfield, Va. 22151 as COM-73-10512 - Price $3.00 printed copy; $1.45 microfiche. Louisiana State University Center for Wetland Resources Sea Grant Preprint, 1973. 15 p, 1 fig, 4 tab, 11 ref. (Paper presented to 4th Annual Meeting and Workshop of World Mariculture Society, January 24-26, 1973, Monterrey, Mexico).

Descriptors: *Fish physiology, *Oily water, *Estuaries, *Canals, *Louisiana, Pipelines, Water pollution effects, Fish, Growth stages, Fish reproduction, Marshes, Oil industry, Water quality.
Identifiers: *Mariculture studies.

Brackish-water oilfield pipeline canals located in coastal Louisiana were rotenoned so that mariculture studies could be conducted. Standing crops within the canals ranged from 133 to 369 kilograms per hectare, with an average minimum wholesale value of $38.80 per hectare. Centrarchids and channel catfish were found in lower salinity canals (5.5 to 8.5 parts per thousand), but not in a higher salinity canal (25 parts per thousand). Sea catfish, oyster toadfish, and gray snapper were found only in the latter. The canals contained from 15 to 28 different fish species, with clupeids, sparids, and sciaenids predominating. Standing crops within pipeline canals are apparently higher than in surrounding areas, but potential brood stock may never reproduce due to their being trapped within the canals. (Woodard-USGS)

A SYMPOSIUM ON THE PRESERVATION AND MULTIPLE-USE PROBLEMS IN THE GREAT LAKES,
Department of Fisheries and Forestry, Ottawa (Ontario).
P. M. Higgins.
In: Multiple-Use Problems in the Great Lakes; Wisconsin University Sea Grant Report WIS-SG-72-107 (Public Information Report No 7), p 15-22, 1972.

Descriptors: *Water pollution sources, *Water pollution effects, *Great Lakes, *Industrial wastes, *Environmental effects, Effluents, Thermal pollution, Heavy metals, Solid wastes, Ecology, Ecosystems, Aquatic life, Water quality, Recreation facilities, Social aspects, Water pollution control, Pollution abatement, Multiple-purpose projects, Management.

The Great Lakes, the largest interconnected bodies of freshwater in the world, were long thought to have had an infinite capacity for receiving man's pollutants. The Lakes were thought to be a bottomless sink. Recent events in the lower Great Lakes and in Lake Michigan have proven how wrong this concept has been. The Lakes have very distinct capacities for receiving wastes. In the case of Lakes Erie and Ontario, the dangerous loading limits of phosphorus are .03 and .08 g/sq m per yr, respectively. The loading to Lake Erie is already greater than the dangerous level, and the projected loading (1986) for Lake Ontario without appropriate treatment will see Lake Ontario move to a eutrophic condition. Some of the ecological changes which man has wrought in the Great Lakes System are presented and other activities which have potential for further ecological upset are identified. (See also W73-12960) (Woodard-USGS)

SIMPLIFICATION OF THE BLUE MOUNTAIN LICHEN COMMUNITIES NEAR A ZINC FACTORY,
Arizona State Univ., Tempe. Dept. of Botany and Microbiology.
H. N. Thomas, III.
Bryologist. Vol 75, No 3, p 315-324. 1972.
Identifiers: *Water pollution effects, *Lichen, Metal, *Pennsylvania, Simplification, Tolerance, *Zinc factory.

In Lehigh Water Gap (Pennsylvania) near a zinc factory, species diversities of corticolous, saxicolous, lignicolous, and terricolous lichen communities are markedly reduced compared to the species diversities of lichen communities in Delaware Water Gap. Nine lichen species were found in Lehigh Water Gap; 84 in Delaware Water Gap. Foliose, fruticose, crustoe species, respectively, are increasingly more tolerant of the conditions around the Zn factory. The effect of the Zn factory on the Blue Mountain lichen flora is discernible up to 6 km to the west of Lehigh Water Gap and 15 km to the east.--Copyright 1973, Biological Abstracts, Inc.
W73-12973

TRISODIUM NITRILOTRIACETATE IN DRINKING WATER: METABOLIC AND RENAL EFFECTS IN RATS,
North Carolina Univ., Chapel Hill. Dept. of Pathology.
K. R. Mahaffrey, and R. A. Goyer.
Arch Environ Health. Vol 25, No 4, p 271-275. 1972. Illus.
Identifiers: Acetates, Metabolic effects, *Nitrilotriacetate (Trisodium), Rats, Renal effects, *Potable water.

Trisodium nitrilotriacetate (Na-NTA) at either 0.01%, 0.10% or 1% (weight/volume) was given to rats in drinking water with or without 200 micrograms lead (Pb)/ml. At the 1% Na-NTA level, rats became ill and were autopsied after 4 wk of the experiment. These rats had a vacuolar tabular nephropathy, hyperglycemia and a marked glycosuria. Rats given 0.01% and 0.10% Na-NTA with or without Pb displayed no histologic changes in kidney, liver, brain or pancreas but had elevated blood glucose levels. The Na-NTA alone lowered

Pb content of kidneys, whereas Na-NTA with Pb did not enhance Pb deposition in kidney. The hyperglycemic effect of Na-NTA was confirmed in a second strain of rats. The mechanism whereby Na-NTA influenced blood glucose levels is unknown but may relate to trace metal chelation.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF STRESS ON PHEASANTS PREVIOUSLY GIVEN POLYCHLORINATED BIPHENYLS,
South Dakota Cooperative Wildlife Research Unit, Brookings.
R. B. Dahlgren, R. L. Linder, and W. L. Tucker.
J Wildl Manage. Vol 36, No 3, p 974-978, 1972.
Identifiers: Phasianus colchicus, *Pheasants, Starvation, Polychlorinated biphenyls, Pesticide residues.

Adult hen pheasants (Phasianus colchicus) that received 16 capsules each containing 50 mg of polychlorinated biphenyls (PCB), Aroclor 1254, once a week, and those given 7 capsules each containing 50 mg of PCB at 3.5-day intervals, were alternately starved for 2 or 3 days and then fed for 2 days. Controls treated similarly lived longer than birds treated with PCB. Brain residues of PCB in treated birds were considerably higher (highest greater than 240 ppm) in birds stressed by starvation when compared with PCB-treated birds that were not starved (highest 24 ppm). Stresses that cause loss of weight can be dangerous to birds having a body burden of PCB.--Copyright 1973, Biological Abstracts, Inc.

SOURCES OF CO2 FOR NUISANCE BLOOMS OF ALGAE,
Auburn Univ., Ala. Dept. of Fisheries and Allied Aquacultures.
C. E. Boyd.
Weed Sci. Vol 20, No 5, p 492-497, 1972. Illus.
Identifiers: *Algae, Ankistrodesmus-falcatus, *Bacteria, Carbon, Chlamydomonas, Chlorella-pyrenoidosa, Coelastrum-microporum, Eutrophication, *Nuisance blooms, Oxides, Scenedesmus-dimorphus, Scenedesmus-quadricauda, Staurastrum-sp.

Bacterial production of CO2 from sucrose substrate increased growth of 7 spp. of algae (Ankistrodesmus falcatus (Corda) Ralfs, Chlamydomonas sp. Chlorella pyrenoidosa Chick, Coelastrum microporum Naegeli, Scenedesmus dimorphus Kutz, S. quadricauda (turp.) Breb, and Staurastrum sp.) in CO2-linked laboratory cultures. Decomposition of organic matter in pond water also supplied enough CO2 to support good algal growth in cultures deprived of other sources of CO2. Estimates of CO2 production from decay of dissolved organic matter in 6 pond waters ranged from 0.32 to 3.53 mg/L per 24 hr. The carbonate-bicarbonate equilibrium system is a major source of CO2 for algal photosynthesis. However, in waters of low or extremely high alkalinity, this system will not support high rates of photosynthesis. In such waters CO2 from decomposition will stimulate photosynthesis. Decomposable organic compounds must be considered with N and P as factors responsible for accelerated eutrophication and nuisance algal blooms.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

SUMMARY REPORT: COMPREHENSIVE SEWERAGE STUDY FOR SCHENECTADY COUNTY, NEW YORK.
Parsons, Brinckerhoff, Quade and Douglas, Inc., New York.
For primary bibliographic entry see Field 05G.
W73-12359

TOWN OF CAIRO WASTE WATER REPORT.
Diachishn (A.) and Associates, New York.

Available from the National Technical Information Service as PB-214 027, $3.00 in paper copy, $1.45 in microfiche. Prepared for Greene County Planning Department, Cairo, New York. August 1972. 18 p, 3 fig, 3 tab. N.Y.P. 246.

Descriptors: *Planning, *Sewerage, *Waste water treatment, Projections, Costs, Federal grants, *New York, Treatment facilities, City planning.
Identifiers: *Cairo (New York).

A planning prospectus is presented for the possible construction of a wastewater disposal system for the small town of Cairo, New York (year round population approximately 800) and 3 nearby hamlets which have adequate public water supplies but no sanitary sewerage. A previous study for comprehensive sewerage is reviewed, population growth to 2020 is forecast, possible wastewater treatment facilities are outlined, and a sanitary sewer district to encompass the hamlets of Cairo, including South Cairo, Purling and Acra, is proposed. Costs are also estimated and it is concluded that construction of the facilities is not likely without federal and state grants. (Elfers - North Carolina)
W73-12366

REGIONAL UTILITIES STUDY: SEWERAGE VOLUME OF TECHNICAL APPENDIX.
Minges (James S.) and Associates, Inc., Farmington, Conn.

Prepared for Capitol Region Planning Agency, Hartford, Conn., 1969. 134 p, 13 fig, 30 tab, 40 ref, glossary. UPA: CONN P-78 (G).

Descriptors: *Sewerage, *Waste water treatment, Land use, Projections, Treatment facilities, Planning, *Connecticut, Regional analysis, Regional development.
Identifiers: Service areas, Hartford (Conn), Sewage loads, Treatment plant capacity.

Detailed background data related to sewerage are presented. Planning procedures involved in formulating the final sewerage plans presented in the Regional Utilities Study are illustrated. The data and planning information fall under several categories: (1) background data on population and land use plus planning concepts; (2) sewerage inventory data on existing systems and treatment plants, sources of wastewater, service areas, and sewage flows; (3) the future needs for sewerage including estimates of future sewage flows and service areas; and (4) alternative sewerage plan elements such as proposed treatment plant capacities, their receiving streams, and their costs. Most of the data are presented on a town by town basis. (Elfers - North Carolina)

WASTE WATER TREATMENT IN COMMERCIAL FISH PROCESSING: REDUCING STICK WATER LOADINGS,
Wisconsin Univ., Madison.
J. T. Quigley, and D. A. Stuiber.
Available from NTIS, Springfield, Va. 22151 - COM-73-10158 - Price $3.00 printed copy; $1.45 microfiche. Sea Grant Advisory Report No 1, WIS-SG-72-401, November 1972. 17 p, 5 fig, 4 tab, 4 ref.

Descriptors: *Waste water treatment, *Food processing industry, *Water pollution control, *Suspended solids, Lipids, Proteins, Aerobic treatment, Anaerobic bacteria, Waste treatment, Methodology, Industrial wastes, Lake Michigan.
Identifiers: Anaerobic processes, Aerobic processes.

At the request of a commercial fish processor operating on Lake Michigan, Sea Grant Advisory Services personnel investigated a waste water disposal problem. Large volumes of waste water resulting from the processing of alewives for fish meal were being inadequately treated in a lagoon system. Since the partially treated effluent then entered Green Bay, an abatement order had been issued by the State of Wisconsin. The waste water problem was studied in two stages. First, practices were examined to determine whether process revisions could be made to reduce the amount of lipids, protein and other suspended solids in the discharge. While little progress could be made within the constraints of the existing process, a new step was developed to remove more solids and to increase product recovery. Secondly, the resulting waste water discharge was studied to improve treatment practice. Owing to the complexity of the material in the discharge, an anaerobic treatment stage was required. Design was focused on combination anaerobic-aerobic systems. (Woodard-USGS)
W73-12420

A PILOT FISH-POND SYSTEM FOR UTILIZATION OF SEWAGE EFFLUENTS, HUMBOLDT BAY, NORTHERN CALIFORNIA,
California State Univ., Humboldt, Arcata.
G. Allen, G. Conversano, and B. Colwell.
Available from NTIS, Springfield, Va 22151 as COM-73-10333 Price $3.00 printed copy; $1.45 microfiche. Sea Grant Publication HSU-SG-3, September 1972. 25 p, 3 fig, 3 tab, 6 ref.

Descriptors: Fisheries, *Fertilization, *Sewage effluents, Ponds, *Construction costs, *California, Real costs, Structural analysis, Engineering, *Water reuse.
Identifiers: *Fish pond construction.

In October of 1969, the California Wildlife Conservation Board authorized funds to construct two fish ponds to undertake pilot studies of fertilization with sewage effluents to enhance the growth of fish. The city of Arcata granted to California State University, Humboldt, the use of its area for a minimum of ten years for aquaculture purposes. All real costs (estimated at $53,732.00) in the construction of these two ponds are presented, and the engineering and construction problems encountered are described. In addition, ways are suggested to minimize such problems and to reduce the costs for any similar ponds which might be planned in the future either for experimental or production purposes. (Woodard-USGS)
W73-12434

SYSTEM FOR REMOVING COLOR FROM PAPER MILL LIQUID WASTE,
Owens-Illinois, Inc., Toledo, Ohio. (assignee)
H. C. Croom.
U. S. Patent No. 3,736,254, 3 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1669, May 29, 1973.

Descriptors: *Patents, Wood wastes, *Color, Lime, Carbon dioxide, Pulp and paper industry, Treatment, Pollution abatement, Water pollution control, Water quality control, Chemical reactions, Pulp wastes, *Waste water treatment.
Identifiers: Paper mill wastes.

Waste water discharged from a paper mill is passed through the following steps: lime and lime mud additions, mixing, clarification, and carbonation. Clarification takes place under alkaline conditions to effect precipitation of calcium salts and conjoint agglomeration separation of color bodies. The resulting effluent is carbonated with carbon dioxide, promoting further precipitation of calcium salts and conjoint agglomeration of color bodies. (Sinha-OEIS)
W73-12445

WATER DECOLORIZATION,
M. Ghassemi, H. L. Recht, and E. V. Kleber.
U. S. Patent No. 3,736,255, 4p, 7 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1669, May 29, 1973.

Descriptors: *Patents, Pollution abatement, *Industrial wastes, Chemical reactions, *Filtration, Treatment, Color, Pulp and paper industry, *Waste water treatment, Water quality control, Water pollution control, *Tannery wastes.
Identifiers: Lanthanum salts, Rare earths, Textile mills.

A method is provided for chemically removing coloring matter from water by treating the coloring matter-containing water with a trivalent rare earth salt, generally as a mixture of such salts, to form an insoluble rare earth precipitate and then separating the precipitate from the water. The rare earth precipitant salt, such as lanthanum chloride or lanthanum sulfate, may be regenerated by first heating the rare earth precipitate to form rare earth oxides and to drive off the organic components by converting them to carbon dioxide and water. The rare earth oxide may be used directly in acidic waters or converted to a soluble rare earth salt by using acid such as dilute hydrochloric or sulfuric acid. (Sinha-OEIS)
W73-12446

METHOD OF REDUCING PHENOLIC WASTE,
General Electric Co., Pittsfield, Mass. (assignee)
J. H. Thayer, and E. C. Y. Fan.
U. S. Patent No. 3,736,292, 2 p, 2 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1675, May 29, 1973.

Descriptors: *Patents, *Phenols, Resins, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, Chemical reactions.
Identifiers: Aldehyde.

Phenol content is markedly reduced in waste discharged from apparatus used for producing phenol-aldehyde resins. Aqueous solutions produced by the reaction between the phenol and aldehyde at different stages of the reaction and containing different proportions of phenol are mixed together at a temperature in the range of about 30C. to 45C. This provides rapid separation into two solution layers, of which one contains low phenol concentration and may be discharged as waste, and the other contains high phenol concentration which is returned to the reaction vessel for further use in resin production. The low phenol waste solution thus discharged enables a reduction in pollution of streams into which products of the resin process are usually discharged. (Sinha-OEIS)
W73-12447

PROCESS AND APPARATUS FOR REMOVING MERCURY FROM WASTE WATER,
Sobin Chlor-Alkali, Inc., Orrington, Maine. (assignee)
P. De Angelis, A. R. Morris, and A. L. MacMillan.
U. S. Patent No. 3,736,253, 4 p, 1 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1669, May 29, 1973.

Descriptors: *Patents, *Industrial wastes, *Waste water treatment, Metals, Resins, Coals, *Chelation, *Filtration, Chemical reactions, Pollution abatement, Water pollution control, Water quality control, *Mercury.
Identifiers: Anthracite coal, Chemical treatment.

Mercury laden water can be treated with sodium borohydride to reduce dissolved mercury to the metallic form. The water treated with reducing agent is filtered through a pressure leaf filter coated with a filter aid, contacted with finely divided anthracite coal and then with a chelating resin. Three examples are given. (Sinha-OEIS)
W73-12449

ACTIVATED SLUDGE PLANT,
R. H. Uden.
U.S. Patent No. 3,735,870, 4 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1578, May 29, 1973.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Activated sludge, *Aeration, *Industrial wastes, Pollution abatement, Water quality control, Water pollution control, Treatment facilities.

Connected in series are a septic or digester tank, aeration tanks, a settling tank and a final aeration tank. Sewage enters the digester tank where all heavy grit and large particles remain to decompose and break down to be carried into the next stage, the aeration cycle. Here it meets re-aerated sludge entering from an advanced point in the cycle. The mixture of sewage and sludge then passes along a series of aerating tanks, to a settling tank where the activated sludge is pumped from the bottom to the first aeration tank, the floating scum is pumped into the digester tank, and the purified sewage is passed to a final aeration tank from whence it may be discharged into a body of water or onto the land. (Sinha-OEIS)
W73-12451

FLOTATION MACHINE WITH VERTICALLY RECIPROCATING AERATORS,
A. M. Fedotov, E. S. Alexeev, G. A. Denisov, K. A. Rundkrist, and A. A. Skrunde.
U. S. Patent No. 3,735,868, 5 p, 8 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1578, May 29, 1973.

Descriptors: *Patents, *Aeration, Equipment, *Flotation, *Mineral industry, *Waste water treatment, *Industrial wastes, Pollution abatement, Water quality control, Water pollution control.

A flotation machine incorporating a chamber for pulp and a means for removing separated products, also contains vibration aerators and ducts for the supply of air to piston like portions. There are also openings for the passage of pulp during the upward stroke of the aerators. The piston-like portion of each aerator is provided with flaps of elastic material adapted to close the openings and for the passage of pulp in the course of the aerator downward stroke and open them in the course of the aerator upward stroke. As the result of such an arrangement, the operation of the machine is accompanied with an intensive stirring and aeration of pulp at low values of the vibrational speed of the aerator, owing to which there takes place a considerable reduction of the electric energy consumption and aerator wear. (Sinha-OEIS)
W73-12452

WASTE DISPOSAL ASSEMBLY,
A. G. Borden.
U.S. Patent No. 3,734,852, 4 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 910, No 4, p 1312, May 22, 1973.

Descriptors: *Patents, *Sewage treatment, *Pollution abatement, Equipment, Heat treatment, Bacteria, *Waste treatment, *Water pollution treatment, *Water quality control, *Sanitary engineering, Water pollution control, Waste disposal.

Sewage is subjected to thermal treatment in the first chamber of this assembly. It is held until it attains a temperature at least that of boiling water to reduce the bacterial level to a relatively low tolerable level. A jacket forming the second chamber is provided with a gas inlet and a gas outlet so that hot gas passes through the second chamber heating the first chamber by conduction. (Sinha-OEIS)
W73-12454

WASTEWATER TREATMENT SYSTEM,
Consolidated Foods Corp., Hayward, Calif. Shasta Beverages Div.
F. A. Karr.
U.S. Patent No 3,734,850, 3 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 910, No 4, p 1311, May 22, 1973.

Descriptors: *Patents, *Waste water treatment, *Oxygenation, *Industrial wastes, Pollution abatement, *Aeration, Bacteria, Enzymes, Water quality control, Water pollution control, Bubbles, *Biological treatment, Biochemical oxygen demand.
Identifiers: *Gas bubbles.

A method and apparatus are provided for treating wastewater by the injection of an oxygen-containing gas, such as air or oxygen or mixtures of the same, into the wastewater while controlling the maximum size of the injected gas bubbles to increase the adsorbed oxygen content retained by wastewater. The injection is made under pressure. The injection is through elements at the bottom of a sump or on stream in a recycle line to and from the sump. A bed of perforate balls on the bottom of the sump provides an excellent surface area for bacterial treatment by coated enzymes injected into the system. (Sinha-OEIS)
W73-12455

CIRCULAR FLOTATION SYSTEM,
Petrolite Corp. St. Louis, Mo. (assignee)
W. F. Burns.
U.S. Patent No. 3,733,272, 6 p, 6 fig, 3 ref; Official Gazette of the United State Patent Office, Vol 910, No 3, p 903, May 15, 1973.

Descriptors: *Patents, *Waste water treatment, *Suspended solids, *Flotation, Equipment, Pollution abatement, Water quality control, Water pollution control.
Identifiers: Dissolved air flotation.

A flotation system removes suspended material from a liquid in a circular vessel with a vertical axis. An upright cylindrical inlet chamber resides centrally on the vessel and receives in a mixing zone in its lower portion the liquid containing dissolved flotation gas through a horizontal tangential inlet. Vertical vanes above the mixing zone direct the circulation liquid into a radial and linear flow rising upward in the inlet chamber. An inverted conical cover supported by the vanes provides an unbroken annular nozzle to direct liquid flow from the inlet chamber in a path forming an acute angle with the top of the vessel. Circumferential liquid outlets on the vessel remove the clarified liquid adjacent the sidewall at a certain selected horizon. Accumulated floating deposits and settled solids are removed through the rotary action of a blade which deposits them into a sump. Settled solids are moved by a bottom scraper into the same sump and both are removed. (Sinha-OEIS)
W73-12457

PROCESS OF TREATING AND PURIFYING SEWAGE, PARTICULARLY OF SEWAGE CONTAMINATED WITH DETERGENTS,
K. Marschall.
U.S. Patent No 3,733,268, 2 p, 1 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 910, No 3, p 902, May 15, 1973.

Descriptors: *Patents, *Waste water treatment, Oil wastes, *Flocculation, *Filtration, *Detergents, Ozone, Treatment, Pollution abatement, Water pollution control, Water quality control, Atmospheric pressure.

Following preliminary treatment for removal of oil, the sewage is introduced into a container which is held under atmospheric pressure. A mixture of ozone and other gases is introduced. The sewage is sucked from the lower portion of the container and is conducted through a recirculation system. The prepurification may comprise not only removal of oil but aeration, filtration and removal of flocculants. (Sinha-OEIS)
W73-12458

WASTE WATER PURIFICATION BY BREAKPOINT CHLORINATION AND CARBON ADSORPTION,
Environmental Protection Agency, Washington, D.C. (assignee)
D. F. Bishop, A. F. Cassel, and T. A. Pressley.
U.S. Patent No 3,733,266, 4 p, 1 fig, 1 tab, 9 ref; Official Gazette of the United States Patent Office, Vol 910, No 3, p 902, May 15, 1973.

Descriptors: *Patents, *Waste water treatment, *Adsorption, *Chlorination, Ammonia, *Carbon, Chemical reactions, Pollution abatement, Water quality control, Water pollution control.
Identifiers: Breakpoint chlorination.

Wastewater having an NH3--N content in the range of 8-30 mg/liter of wastewater is passed into a mixer reactor. Chlorine is added in the amount of 55-300 mg/liter of wastewater to provide a Cl:NH3--N ratio of about 8-10:1. The pH is maintained at a value between 5.8 and 9.5 providing for breakpoint chlorination. The mixture now substantially free of NH3--N, is introduced into a carbon adsorption zone. Ammonia removal by breakpoint chlorination proceeds according to: 3Cl2 + 2NH3 goes to N2 + 6HCl. The breakpoint is defined as the point where the NH3--N is reduced to zero, free available chlorine is detected and the total residual chlorine is minimized. (Sinha-OEIS)
W73-12459

CROSS-FLOW FILTRATION PROCESS FOR REMOVAL OF TOTAL ORGANIC CARBON AND PHOSPHATES FROM AQUEOUS SEWAGE EFFLUENTS,
Atomic Energy Commission, Washington, D.C. (assignee)
K. A. Kraus, and H. A. Mahlman.
U.S. Patent No 3,733,265, 4 p, 3 fig, 5 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 910, No 3, p 902, May 15, 1973.

Descriptors: *Patents, Phosphates, Organic matter, *Nutrient removal, *Filtration, *Waste water treatment, *Liquid wastes, *Sewage treatment, Chemical reactions, Pollution abatement, Water quality control, Water pollution control.
Identifiers: Chemical treatment.

A method is set forth for the removal of organic material and phosphate from liquid sewage. The sewage is mixed with finely divided carbon or graphite and at least one additive from the group consisting of a salt which hydrolyzes to a hydrous oxide, or the hydrous oxide itself. The pH is adjusted to a value no greater than 4. The mixture is then moved tangentially past one face of a porous substrate at a pressure of from 3 to 100 psi to produce a clarified filtrate on the opposite side of the substrate. Six examples are cited. (Sinha-OEIS)
W73-12460

WASTE TREATMENT SYSTEM,
Kimberly-Clark Corp., Neenah, Wis. (assignee)
M. G. Mandt.
U.S. Patent No 3,733,263, 3 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 910, No 3, p 901, May 15, 1973.

Descriptors: *Patents, *Waste water treatment, *Suspended solids, *Aeration, Equipment, Pollution abatement, Water pollution control, Water quality control, Biochemical oxygen demand.

A single unit utilizes low power input. A rotating ejector bank periodically scours the aeration tank bottom. Oxygen-rich gas is introduced within an aeration zone causing the liquid to move circuitously about a baffle. A portion of the sewage passes under the baffle into a central clarifying zone. The solids settle out and the liquid is removed. The solids are removed by the use of the rotating ejector bank or banks. (Sinha-OEIS)
W73-12461

NEUTRALIZATION OF METAL CONTAINING WASTES,
Secretary of the Interior, Washington, D.C. (assignee)
L. C. George, L. N. Ballard, and V. H. Feeler.
U.S. Patent No 3,736,239, 3 p, 2 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 910, No 5, p 1666, May 29, 1973.

Descriptors: *Patents, *Industrial wastes, *Waste water treatment, Metals, Pollution abatement, Water quality control, Water pollution control, *Hydrogen ion concentration, Sodium compounds, Chemical reactions, *Filtration, *Neutralization.
Identifiers: *Cyanide, Electroplating industry, Chemical treatment, Sodium hydroxide, Hydrogen cyanide, Metal oxides.

The process comprises the slow addition of an acid, metal-containing liquid waste stream to an alkaline, cyanide and metal-containing liquid waste stream. The order of addition is critical in order to avoid the formation of hydrogen cyanide. It is important that the mixing be done slowly with agitation. The reaction is best carried out in a vessel equipped with stirring or agitation and an alkaline scrubber. Any evolved gas is scrubbed with an alkaline solution, such as sodium hydroxide, as a safety precaution to collect any hydrogen cyanide gas that may evolve. The pH should not be allowed to drop below a value of about 4 to 4.5. The precipitate may be recovered by filtration and further processed for recovery of contained metals, preferably by oxidation to form the corresponding metal oxides. (Sinha-OEIS)
W73-12462

POSSIBILITIES OF WATER TREATMENT BY MEANS OF A MAGNETIC FIELD,
Glowny Instytut Gornictwa, Katowice (Poland).
J. Sablik.
Water Econ, Vol 20, No 7, p 52-67, 1970. 9 fig, 4 tab, 51 ref.

Descriptors: *Water treatment, Sedimentation, Salts, Sewage treatment, Sludge, Water properties, Flocculation, Foreign research, Magnesium compounds, Iron compounds, Coagulation, Calcium compounds, *Waste water treatment, Dissolved oxygen, Bibliographies, Sanitary engineering, *Industrial water.
Identifiers: Poland, Scale-forming compounds, *Magnetic fields, Sediment concentration, Electromagnets.

Because of the great demand in industry and the need to treat industrial water and sewage, water treatment is becoming one of the principal problems in water economy. Much time has been devoted to investigations into the effects of different physicochemical reactions on water environment. Achievements in the treatment of water environment in a magnetic field are presented. The technological aspects, results of the basic investigations, and the hypothesis used in attempting to justify the phenomenon observed are discussed. Consideration should be given to the possibilities of using data from previous investigations to obtain a more thorough knowledge of surface and interphase phenomena in a water environment. (USBR)
W73-12481

WASTEWATER TREATMENT DESIGN RELATED TO BIOLOGICAL GROWTH SUPPORTED BY ACTIVATED CARBON,
Mississippi State Univ., State College. Dept. of Civil Engineering.
E. C. McGriff, Jr.
Available from the National Technical Information Service as PB-222 175, $3.00 in paper copy, $1.45 in microfiche. Mississippi Water Resources Research Institute, Mississippi State Report, July 1973. 46 p, 18 fig, 9 tab, 8 ref. OWRR-A-067-MISS (1).

Descriptors: *Waste water treatment, *Activated carbon, *Oxygen uptake, *Kinetics, Biological treatment, *Oxygen demand, Biological properties, Chemical oxygen demand.

The objective was to evaluate the response of the biological activity at the carbon solid-liquid interface of an expanded bed adsorber. The evaluation of the biological activity was performed by conducting non-flow kinetic studies, continuous flow kinetic studies, and oxygen uptake studies. The research was divided into two phases. Phase I consisted of the non-flow kinetics whereas Phase II consisted of the continuous flow kinetics and the oxygen uptake studies. The results indicate that the response of the biological film supported by granular carbon can be defined by conducting oxygen uptake studies. Biological activity of the attached film was established through the use of an energy-total energy constant. The average constant calculated was 0.50 mgO2 utilized per mg COD removed. This constant can be utilized to predict oxygen demand for the attached film on granular carbon used in expanded bed adsorbers.
W73-12494

PHOSPHORUS REMOVAL AND PLANT OPERATION STUDIES AT FORT WAYNE, INDIANA,
Fort Wayne Water Pollution Control Plant, Ind.
P. L. Brunner, M. Spiegel, and C. F. Niles, Jr.
Available from the National Technical Information Service as PB-222 383, $7.75 in paper copy, $1.45 in microfiche. Environmental Protection Agency report, EPA-R2-73-274, June 1973, 106 p, 15 fig, 52 tab, 16 ref. EPA Project 11060 DXX.

Descriptors: *Nutrient removal, Flotation, Sludge, *Waste water treatment, *Indiana, Phosphorus, Treatment facilities, Water softening, Lime.
Identifiers: *Phosphorus removal, Luxury uptake, *Sludge bulking, *Fort Wayne (Ind).

The demonstration project at the Fort Wayne, Indiana Wastewater Treatment Plant showed that the addition of a portion of the spent lime sludge from the City's water conditioning plant to the influent to the aeration tanks would slightly increase the normal capacity of the activated sludge to remove phosphorus. The same addition, 31,500 to 35,500 pounds per day of spent lime sludge solids, prevented sludge bulking during the warmer months of the year when poor settling sludge is experienced. Duplicate pilot plants were evaluated for the removal of phosphorus by luxury uptake and acid elutriation and as a conventional activated sludge unit. Removals in both units were comparable to those attained in the full scale plant. Higher phosphorus removals were achieved when chemicals (lime, ferric chloride, polyelectrolytes,

pickling acid) were used singly or in combination in the pilot plants. A survey of the flow and characteristics of the sewage in various locations in the City demonstrated that the concentration of total and soluble phosphorus varies with location and, therefore, can to some extent be controlled. Preliminary studies with a tertiary treatment pond receiving treatment plant effluent and storms water overflow indicate that BOD5 and suspended solids concentrations are substantially reduced during passage through the pond. (EPA)

STUDY OF UTILIZATION AND DISPOSAL OF LIME SLUDGES CONTAINING PHOSPHATES,
Monsanto Research Corp., Dayton, Ohio. Dayton Lab.
R. E. Opferkuch, T. Ctvrtnicek, and S. M. Mehta.
Available from the National Technical Information Service as PB-222 354, $8.00 in paper copy, $1.45 in microfiche. Environmental Protection Agency Report No. EPA-R2-73-282, June 1973. 78 p, 23 fig, 27 tab, 26 ref, 8 append. 17070 FBE. 14-12-199.

Descriptors: *Sludge disposal, *Phosphates, *Tertiary treatment, Economics, *Beneficiation, Municipal wastes, Disposal, *Waste water treatment, Fertilizers, Lime, Slaking, Magnesium, Cost comparisons.
Identifiers: Phosphate enrichment, Phosphate industry, *Lime sludges, Thermal beneficiation, Carbonation, Calcining, Transportation costs, Fertilizer value.

Tertiary treatment of municipal sewage with lime effectively removes phosphate but generates considerable quantities of sludge and a sludge disposal problem. Evaluation of technical and economic aspects of potential sludge utilization, or disposal concepts considered agricultural applications, conversion of sludge to products of known market value, and transporting sludge from the plant site by various means. The phosphate industry appeared to offer the greatest potential for utilization of the sludge provided sludge phosphate content could be enriched. Methods considered for phosphate enrichment were: thermal beneficiation, carbonation, and calcining/slaking. While the latter method was the most efficient, process complexity and economics militate against this general approach. In areas where the magnesium content of wastewater is relatively high, sludge processing to recover both phosphate and magnesium could be economical but would require considerable development. Furthermore, process complexity would not suit this approach to treatment plant operations. Preliminary cost estimates are presented for several levels of process complexity in liming secondary effluent with potential recovery of lime and phosphate. A summary of transportation costs, by various means, for removal of sludge from the treatment plant site is also presented. (EPA)
W73-12501

STABILIZATION OF SEWAGE SOLIDS BY THE CHANNEL AERATION PROCESS,
Wisconsin Univ., River Falls.
M. W. Wehking, J. M. Bostrack, L. J. Monette, and L. D. Hansen.
Environmental Protection Agency report, EPA-R2-73-213, June 1973. 90 p, 15 fig, 41 tab, 28 ref, 4 append. EPA Project 17070 DIZ.

Descriptors: *Sludge disposal, *Sludge digestion, *Biological treatment, *Aerobic treatment, Dissolved oxygen, Cost analysis, *Waste water treatment, *Oxidation lagoon, *Aeration.
Identifiers: Oxidation ditch, *Surface aeration, Volatile solids reduction.

The use of an oxidation ditch for treatment of domestic sewage sludges by aerobic digestion was superior to anaerobic digestion. Maximum reductions of 64.7% for volatile solids and 67.8% for COD were achieved. Low temperatures inhibit the process such that below temperatures of 55F neither of these reductions exceeded 45%. At moderate temperatures the DO content of the mixed liquor appears to be the factor limiting COD and volatile solids reductions. When the DO content exceeds 1.5 ppm the reductions of COD and volatile solids reached their maximum values, however, nitrate and phosphate concentrations in the mixed liquor increased to values of 30 ppm and 115 ppm respectively. The dewatering characteristics of the digested sludge were no better than those of raw sludge. Evidence also indicates that this process is better suited to continuous rather than semi-continuous operation. The process also requires close control of operating conditions. Operating costs were $36.50 per ton of solids treated. (EPA)
W73-12502

ELECTRICAL STIMULATION OF MICROBIAL WASTE TREATMENT,
Michigan Univ., Ann Arbor. Dept. of Chemical Engineering.
J. S. Schultz.
Available from the National Technical Information Agency, as PB-222 384, in paper copy $3.50, in microfiche $1.45. Environmental Protection Agency Report No. EPA-R2-73-278, June 1973. p 46, 18 fig, 3 tab. 17050 DGJ.

Descriptors: *Electricity, *Fermentation, Electric fields, Electric currents, Bacteria, Yeast, Growth rates, Waste treatment.
Identifiers: *Stimulation, Membrane transport, Batch culture, Continuous culture.

This project has been directed towards the evaluation of the effect of electrical fields, AC and DC, on the metabolism and growth of micro organisms. Test systems used were batch culture, (aerobic and anaerobic), continuous culture, and the use of genetic mutants for membrane transport studies. Voltages were applied to cell suspensions with inert platinum and carbon electrodes, and were limited to levels below the onset of electrolysis of water. Care was exercised in maintaining constant temperatures for comparative experiments, since on direct effect of applied currents was resistive heating of the solutions. The growth medium was designed so that the carbon source (usually glucose) was the limiting nutrient. For most of the studies, analysis of cell growth and glucose utilization was used to evaluate the effects of electric fields. In batch fermentation experiments some stimulation of growth and sugar utilization was found over a current range of 40 to 120 ma DC, however, the amount of stimulation was within the range of experimental variations. In continuous fermentation, cell growth was not significantly stimulated by electric fields. Electrical fields caused some increase in the accumulation and transport of galactose by E. coli.

DISINFECTION OF SEWAGE EFFLUENTS,
Illinois State Water Survey, Urbana.
F. W. Sollo, Jr., and H. F. Mueller.
Available from the National Technical Information Service as PB-222 355, $6.00 in paper copy, $1.45 in microfiche. Environmental Protection Agency report number, EPA-670/2-73-029, July 1973. 69 p, 37 fig, 7 tab, 35 ref. EPA Project 17060 DNU.

Descriptors: *Disinfection, Halogens, *Chlorine, *Waste water treatment, *Sewage effluents, *Hydrogen ion concentration, Temperature, Coliforms, Bacteria.
Identifiers: *Bromine disinfection.

In view of difficulties encountered with chlorine as a disinfectant under certain conditions, particularly due to ineffectiveness of the chloramines at high pH, bromine is being evaluated as an alternate or supplement to chlorine for disinfection of treated wastewater. Chlorine and bromine are being compared under varying conditions of pH and temperature, using an activated sludge effluent as the test substrate. Both dosage and residuals of chlorine and bromine are being correlated with percent survival of coliforms, fecal coliforms, and total bacterial numbers. Results indicate that in wastes of this type, the effectiveness of chlorine decreases with increasing pH, whereas the effectiveness of bromine increases. Thus it appears possible that bromine may have advantages in wastes of high pH. Combinations of chlorine and bromine are also being evaluated, and it appears that pretreatment with chlorine, followed by bromine, may produce effective disinfection at lower cost than bromine alone. FLUIDIZED BED CLARIFICATION AS APPLIED TO WASTEWATER TREATMENT,
Research Triangle Inst., Durham, N. C.
J. C. Orcutt.
Copy available from GPO Sup Doc as EP1.23/2-72-032, $1.50; microfiche from NTIS as PB-216 604, $1.45 in microfiche. Environmental Protection Agency, Technology Series Report EPA-R2-72-032, December 1972. 98 p, 21 fig, 10 tab, 21 ref. EPA Project 17030 EYA. Contract 14-12-912.

Descriptors: *Waste water treatment, *Coagulation, *Solids contact processes, Sludge treatment, *Separation techniques, *Mathematical models, Silica.
Identifiers: *Sludge blanket, Aluminum sulfate, Ferric sulfate, Activated silica.

An experimental study of the application of a fluidized sludge blanket clarifier to the coagulation and separation of wastewater solids has been made to determine the effects of controlled process variables on the treatment achieved. Experiments using alum and ferric chloride coagulants were carried out in 12- and 24-inch diameter columns by systematic variation of wastewater pH, coagulant dose, upflow fluid velocity, and blanket depth. The results were analyzed using regression analysis techniques, and empirical relationships were derived relating the variables to the removal of suspended solids, total organic carbon, phosphorus, and coagulant metal ions. The sludge production rate was also correlated empirically with the operating variables. A study of the settling rates of discharged sludge and the fluidized blanket was made by direct observation. (Kreissl-EPA)
W73-12505

TERTIARY TREATMENT OF COMBINED DOMESTIC AND INDUSTRIAL WASTES,
Cornell, Howland, Hayes and Merryfield, Corvallis, Oreg.
J. W. Lee, Jr.
Copy available from GPO Sup Doc as EP1.23/2 73 236, $2.60; microfiche from NTIS as PB-222 251, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-236, May 1973. 203 p, 67 fig, 14 tab, 38 ref. EPA Project 11060 DLF.

Descriptors: *Waste water treatment, *Aerobic treatment, *Tertiary treatment, *Industrial wastes, Activated sludge, *Domestic wastes, Flocculation, Filtration, Chemical precipitation, Phosphates, Treatment facilities, *Oregon, Biochemical oxygen demand.
Identifiers: Pet food processing wastes, Mixed media filter, Tube clarifier, Alum, BOD5, Polyelectrolyte, Treatment costs, Phosphate removal, Combined treatment, *Tualatin (Ore).

Operation of a secondary-tertiary treatment facility for combined domestic and pet food manufacturing industrial wastewaters at the City of

Tualatin, Oregon, was studied for 16 months. The study demonstrated the feasibility of automated tertiary treatment for small communities treating a combined domestic and industrial wastewater at a reasonable cost. The system was designed for an average daily flow of 280,000 gpd and a BOD5 load of 630 pounds per day. The extended aeration activated sludge process with a design detention time of 24 hours was employed for secondary treatment. An experimental 60 degree inclined tube settler located in the aeration-surge basin provided secondary effluent clarification. The tertiary system consisted of a four step process: (1) alum and polyelectrolyte coagulation, (2) flocculation, (3) inclined tube sedimentation, and (4) mixed media filtration. The tertiary system demonstrated the capability to produce an effluent quality of less than 10 mg/l BOD5 and 5 mg/l suspended solids with a total phosphate residual of 0.1 to 1.0 mg/l (as P). The total capital cost of the facility was $245,800. Based on total annual cost, the cost of treatment at the design conditions was $0.42 per 1000 gallons processed and $0.19 per pound of BOD5 removed. (EPA)
W73-12512

IDENTIFICATION AND CONTROL OF PETROCHEMICAL POLLUTANTS INHIBITORY TO ANAEROBIC PROCESSES,
Union Carbide Corp., South Charleston, W. Va. Chemicals and Plastics.
J. C. Hovious, G. T. Waggy, and R. A. Conway.
Copy available from GPO Sup Doc as EP1.23/2 73-194; $1.25; microfiche from NTIS as PB-222 287, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-194, April 1973. 103 p, 37 fig, 18 tab, 21 ref. EPA Project 12020-FER.

Descriptors: *Chemical wastes, *Industrial wastes, *Anaerobic treatment, Anaerobic digestion, Methane bacteria, Filtration, *Waste water treatment, Filters, Organic wastes, Phenols.
Identifiers: Inhibition, Acrylates, *Crotonaldehyde.

Identification studies were made on potentially inhibitory materials using an unacclimated anaerobic biomass. Identified inhibitory materials and concentrations in mg/l for a 50 percent decrease in activity were acrolein (20-50), formaldehyde (50-100) crotonaldehyde (50-100), 2-ethyl-1-hexanol (500-1000 mg/l), methyl isobutyl ketone (100-300), diethylamine (300-1000 mg/l), acrylonitrile (100 mg/l), 2-methyl-5-ethylpyridine (100), ethylene dichloride (150-500), ethyl acrylate (300-600), and phenol (300-1000). Inhibitory effects were more severe at high volatile acid concentrations. Acclimated cultures were developed in mixed digesters for crotonaldehyde, phenol, and to some degree to ethyl acrylate. No acclimation was observed for sodium acrylate. An anaerobic filter was acclimated to 600 mg/l crotonaldehyde as compared to the 50-100 mg/l unacclimated inhibitory level. Treatment of formaldehyde, ethyl acrylate, phenol, and acrylonitrile indicated synergestic inhibition. Anaerobic filter studies also indicated that crotonaldehyde inhibition could be avoided in a chemical manufacturing waste by dilution, successful treatment of 'hard' surfactant containing wastes also was noted. (EPA)

DEMOSTRATION OF A WASTE DISPOSAL SYSTEM FOR LIVESTOCK WASTE,
Moore Engineering, Inc., West Fargo, N. Dak.
C. R. Moore.
Copy available from GPO Sup Doc as EP1.23/2, 73-245, $0.85; microfiche from NTIS as PB-222 253, $1.45. Environmental Protection Agency, Technology Seires Report, EPA-R2-73-245, May 1973. 50 p, 7 tab, 10 fig, 12 ref. EPA Project 13040 FTX.

Descriptors: *Cattle, Hogs, Sheep, Waste treatment, *Settling basins, Nitrates, Groundwater, Biochemical oxygen demand, Chemical oxygen demand, *Farm wastes, Feed lots, Solid wastes, Dissolved oxygen, *Waste water treatment.
Identifiers: *Stockyards, *Hydrasieve, Sheyenne River, Truck washrack, Solids separation.

Laboratory studies of livestock waste were conducted both before and after the construction of an enlarged settling basin, a hydrasieve at the truck washrack and a two cell waste stabilization pond. A determination of the effectiveness of these two systems and the application of them to feedlots and other livestock facilities in the area were the main objectives. The settling basin and hydrasieve were effective in removing solids and COD from the truck washrack waste. Reductions in COD, total, suspended, and settleable solids were 23.9, 14.8, 50 and 80 percent, respectively. DO increased 42.8 percent and total solids decreased 3 percent across the hydrasieve. This 3 percent consisted of straw and other floating debris which would not be removed at the stabilization pond. The effectiveness of the stabilization ponds was generally good. The BOD5 of the final effluent was reduced 48.6 percent over that of the drainpipe which had drained directly into the Sheyenne River during previous years. (Kreis-EPA)

THE SHAGAWA LAKE PROJECT: LAKE RESTORATION BY NUTRIENT REMOVAL FROM WASTEWATER EFFLUENT,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
K. W. Malueg, R. M. Brice, D. W. Schults, and D. P. Larson.
Copy available from GPO Sup Doc as EP1.23: 73-026, $0.85; microfiche from NTIS as PB-222 255, $1.45. Environmental Protection Agency, Ecological Series Report, EPA-R3-73-026, January 1973. 49 p, 13 fig, 1 tab, 4 ref. PA Program Element 1B1031.

Descriptors: *Eutrophication, *Lakes, *Tertiary treatment, *Algal control, *Phosphorus, Nutrients, Municipal wastes, Mathematical models, Limnology, *Minnesota, *Nutrient removal, *Waste water treatment.
Identifiers: *Shagawa Lake (Minn), *Lake restoration, Algal assay, Nutrient budget.

The U.S. Environmental Protection Agency (EPA) has initiated a research project at Ely, Minnesota, to demonstrate the restoration of eutrophic Shagawa Lake by nutrient removal (primarily phosphorus) from municipal wastewater effluent while permitting such treated effluent to continue to flow into the lake. Studies utilizing an advanced wastewater treatment pilot plant showed that phosphorus could readily be removed and the treated effluent did not promote algal blooms in the receiving waters. The National Eutrophication Research Program (NERP) of EPA began operating and evaluating a full-scale advanced wastewater treatment plant in early 1973. Nutrient removal in the plant is primarily by chemical precipitation with lime and is designed to give a final effluent of 0.05 mg/l total phosphorus or less. NERP will evaluate the extent and rate of recovery of Shagawa Lake until at least 1976. Lake data for this period will be compared to that obtained during the six years prior to advanced wastewater treatment. (EPA)

RECONDITION AND REUSE OF ORGANICALLY CONTAMINATED WASTE SODIUM CHLORIDE BRINES,
Dow Chemical Co., Midland, Mich. Environmental Research Lab.
R. D. Fox, R. T. Keller, and C. J. Pinamont.
Copy available from GPO Sup Doc as EP1.23/2:73-200, $2.10; microfiche from NTIS as PB-222 256, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-200, May 1973. 110 p, 39 fig, 8 tab, 8 ref. EPA Project 12020-EAS.

Descriptors: *Brine disposal, *Wastewater treatment, Adsorption, Activated carbon, Industrial wastes, *Phenols, Operating costs, Water reuse, *Mathematical models, *Sodium chloride.
Identifiers: *Acetic acid, *Brine reuse, Waste recovery, Organics.

A plant of 100 gal/min capacity was constructed and operated for one year to demonstrate the feasibility to remove and recover phenol and acetic acid from an 18% sodium chloride brine by adsorption on fixed beds of activated carbon. The purified brine was used for production of chlorine and caustic soda. Separate electrolytical test-cell evaluation of the purified brine showed it to be equivalent to pure brine. Regeneration of the carbon was accomplished by desorption with dilute sodium hydroxide. The phenol desorbed was recycled to the phenol manufacturing plant while the acetate regenerant was processed to underground disposal wells. More than 23 million gallons of brine were purified. Fourteen cycles of phenol adsorption and regeneration and 105 cycles of acetic acid adsorption and regeneration were completed with no significant deterioration of carbon performance. Phenol removal to <1 ppm was accomplished at 50-140 gal/min and 15-70C with an effective carbon capacity of 0.167 lb/lb. Optimum regeneration was with 4% NaOH at 55-70C. Removal of 90% of the acetic acid from brine requires <80 gal/min flow rate and <40C temperature, the resultant loading is 0.04 - 0.06 lb/lb of carbon. The projected net cost of purifying this waste brine for reuse was $1.32 per 1000 gallons. (EPA)
W73-12521

ION EXCHANGE COLOR AND MINERAL REMOVAL FROM KRAFT BLEACH WASTES,
Montana State Univ., Bozeman. Dept. of Civil Engineering.
R. L. Sanks.
Copy available from GPO Sup Doc as EP1.23/2:73-255, $2.35; microfiche from NTIS as PB-222 257, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-255, May 1973. 189 p, 91 fig, 35 tab, 63 ref. EPA Project 12040 DBD.

Descriptors: *Bleaching wastes, *Waste water treatment, Pulp and paper industry, Effluents, Resins, Lime, Water reuse, Costs, Color, *Ion exchange, *Desalination, *Demineralization, Pulp wastes, Industrial wastes.
Identifiers: Bleach plant wastes, *Color removal.

Laboratory evaluations of twenty resins and seven carbons for removing color and minerals from a four-stage kraft bleach plant showed resins were equal to carbon for decoloring the combined waste. With few exceptions, resins were unsuited for decoloring wastes from each stage separately. Except for success in the use of weak wash to regenerate Amberlite XAD-8 resin, utilization of mill liquors for regeneration was unsuccessful. Sulfuric acid, caustic, and ammonia were good regenerants, but lime was poor. Single stage ion exchange produced water adequate for unbleached pulping. Two-stage desalination produced water adequate for bleached pulping. Any of the continuous counter-current ion exchange processes are probably adequate for producing water for bleached pulping. The estimated cost for desalination including amortization over a 10 year period at 9 percent interest, labor,

chemicals, maintenance, and repairs are estimated to vary from $1.38/1000 gal (for the non-optimized process used in the laboratory) to $0.42/1000 gal (with estimated 90 percent cation regeneration efficiency, 85 percent anion regeneration efficiency, and 87 percent product recovery). (EPA)

Trans. available from Institute of Paper Chemistry Appleton, Wisconsin 54911. Price: $5.00. Typescript Translation of Wochenblatt fur Papierfabrikation, Vol 98, No 18, p 725-727, September 30, 1971. 4 fig.

Descriptors: *Pulp wastes, Water pollution control, *Waste dilution, *Filtration, Pulp and paper industry, Diffusion, Foreign countries, Europe, Effluents, Discharge (Water), Sulfite liquors, Magnesium compounds, Calcium compounds, Filters, Industrial wastes, Efficiencies, *Waste water treatment.
Identifiers: *Sulfite pulping, *Austria, Chemical recovery, Magnesium base liquors, Washing, Pulp washing, Spent sulfite liquors, Spent liquors, Sulfite mills.

The Austrian sulfite pulp and paper mill, Lenzinger Zellulose- und Papierfabrik AG., uses the magnesium-base sulfite process which lends itself more readily to recovery of the spent cooking liquor than does the conventional calcium-base process. As much as 95 percent of the spent sulfite liquor is removed from the digested pulp by a four-stage diffusion washing process which minimizes dilution of the waste liquor. The installation of a new filter line is planned in order to increase the recovery efficiency above 95 per cent and proportionally reduce the amount of effluent discharged into receiving waters. (Speckhard-IPC)

JOINT TREATMENT OF PULP MILL EFFLUENTS AND MUNICIPAL SEWAGE.

Paper Trade Journal, Vol 156, No 18, p 30, May 1, 1972.

Descriptors: *Pulp wastes, *Waste water treatment, *Sewage treatment, Municipal wastes, Biological treatment, Effluents, Pulp and paper industry, Activated sludge, Chlorination, Treatment, Biodegradation, Operating costs, Capital costs, Sulfur bacteria, Feasibility studies, Sewage districts, *Wisconsin, Chlorine, Economic feasibility, Costs, Bacteria, Recycling, Nutrients, Nitrogen compounds, Phosphorus compounds, Solids contact processes, Research and development, Mixing.
Identifiers: Spent liquors, *Green Bay (Wis), *Combined treatment.

The major findings of a feasibility study are reported, in which the sewage from the Green Bay, Wisconsin, Metropolitan Sewerage District was treated jointly with effluents from four local paper mills, using four variations of the activated sludge process. Among these variants, the contact stabilization process proved to be the most successful. The growth of filamentous sulfide-utilizing bacteria in the mixed waste liquors was controlled by continuous dosing of the recycled activated sludge with chlorine. For satisfactory operation of the biological oxidation process, nitrogen and phosphorus compounds had to be added as supplementary nutrients. Capital and operating costs for a full-scale installation are indicated. Recommendations for further research are also listed. (Witt-IPC)

DETOXIFICATION OF KRAFT PULP MILL EFFLUENT BY AN AERATED LAGOON,
International Pacific Salmon Fisheries Commission, New Westminister (British Columbia).
J. A. Servizi, and R. W. Gordon.
Progress Report, No 26, 1972. 26 p. 3 fig, 8 tab, 7 ref.

Descriptors: *Pulp wastes, *Treatment facilities, *Aerated lagoons, *Toxicity, Waste waters (Pollution), Operation and maintenance, Pollution abatement, Industrial wastes, *Waste water treatment, Biodegradation, Water quality control, Water pollution control, *Canada, Pulp and paper industry, Douglas fir trees, Softwood, Coniferous trees, Pollutants.
Identifiers: *Kraft mills, *Malfunction, *Black liquors, *Pulpwood, Green wood, Spruce, Spent liquors.

The occasionally substandard detoxification of kraft pulp mill effluents during their treatment in an aerated lagoon at Kamloops Pulp and Paper Co. Ltd. (recently acquired by Weyerhaeuser Canada Ltd.) prompted an eight-month study during a period of inplant changes for pollution abatement. Compared with a laboratory treatment unit, the aerated lagoon responded similarly to kraft mill effluents. Spills of black liquor (spent alkaline pulping liquor) were responsible for some, but not for all occasions of substandard detoxification. Other causes of residual toxic matter resistant to biooxidation were associated with the pulping of green Douglas-fir and sprucewood chips. (Brown-IPC)

START-UP OF BIOLOGICAL TREATMENT FACILITIES FOR PULP AND PAPER MILL WASTES,
H. A. McLean, and K. L. Murphy.
Pulp and Paper Magazine of Canada, Vol 73, No 7, p 89-92 (p T189-192), July 1972. 7 fig, 9 ref.

Descriptors: *Biological treatment, *Pulp wastes, *Treatment facilities, Lagoons, *Waste water treatment, Monitoring, Operation and maintenance, Measurement, Biochemical oxygen demand, Dissolved oxygen, Hydrogen ion concentration, Nutrients, Oxygen demand.
Identifiers: Process variables.

The startup of two biological effluent treatment installations having five-day retention times is described. Requirements for seeding and nutrient additions were studied in the laboratory and verified in the full-scale installations. The biological activity in the lagoon was monitored by measuring the rate of oxygen uptake. This measurement was related to five-day BOD and dissolved oxygen along the lagoon profile. Reductions and variations in pH with biological treatment are illustrated. Recommendations are made for those aspects deserving special consideration during startup. (Brown-IPC)

NEW TRENDS IN WASTE WATER TREATMENT AND RECYCLE,
Bechtel Corp., San Francisco, Calif.
G. A. Sawyer.
Chemical Engineering, Vol 79, No 16, p 120-128, July 24, 1972. 6 fig, 3 tab.

Descriptors: *Reviews, *Waste water treatment, *Water reuse, *Recycling, Municipal wastes, Sewage treatment, Costs, Industrial wastes, Sludge treatment, Technology, Chemcontrol.

The status of waste water treatment technology is reviewed. Various chemical treatment methods and water recycling schemes are evaluated. Both in-plant recycling systems for various industries and municipal waste water reclamation systems for industrial and general use are covered. Advantages and problems of various regional waste water treatment programs are analyzed, including schemes in which municipal sewage is treated jointly with industrial effluents. Cost data for various treatment processes are indicated. Industrial users of reclaimed municipal waste waters are listed. (Witt-IPC)

SELECTING WASTE WATER AERATION EQUIPMENT,
Keene Corp., Aurora, Ill. Water Pollution Control Div.
R. J. Nogaj.
Chemical Engineering, Vol 79, No 8, p 95-102, April 17, 1972. 5 fig, 3 tab.

Descriptors: *Aeration, *Treatment facilities, Waste water treatment, *Activated sludge, *Aerated lagoons, *Equipment, Pollution abatement, Water quality, Surface waters, Lagoons.
Identifiers: *Aeration.

Aerators commonly used in aeration lagoons and in activated sludge processes for waste water treatment are reviewed. Characteristics and operating parameters of different aerators are discussed. Guidelines are presented for selecting the correct type of aerator for specific applications. Equations are given for calculating the number of dimensions of aerators needed, as well as the size and shape of treatment tanks. (Witt-IPC)

THE TTC TEST FOR THE CONTROL OF EFFLUENT PURIFICATION (TEST TTC - NARZEDZIEM KONTROLI PROCESU OCZYSZCZANIA),
K. Lelonkiewicz.
Przeglad Papierniczy, Vol 28, No 4, p 129, April 1972. 2 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Activated sludge, *Monitoring, *Bioassay, Pulp and paper industry, Effluents, Colorimetry, Testing procedures, Enzymes, Biological treatment, Analytical techniques, Sludge digestion, Oxygen demand, Biochemical oxygen demand, Chemical oxygen demand, Recycling, Foreign research.
Identifiers: Kraft mills, Sulfite mills, Dehydrogenases, Triphenyltetrazolium chloride.

In monitoring the purification of pulp mill effluents by the activated sludge process, the use of 2,3,5-triphenyltetrazolium chloride (TTC) offers a simple, albeit controversial, test method for ascertaining the activity of dehydrogenases. The procedure involves incubating a sludge sample in the dark with TTC, followed by ethanolic extraction of the red triphenylformazan formed. This reduced compound, which serves as an indicator of biooxidation, is then determined colorimetrically. A modified version of the TTC test was applied to activated sludge samples used in treating effluents from sulfite- and sulfate-process pulp mills. The results were compared with those obtained by determinations of chemical and biochemical oxygen demands, oxygen indexes, and other standard analytical procedures. Under steady operating conditions, the dehydrogenase activity remained constant. The enzyme activity was sensitive to changes in pollution load and to disturbances in recycling and in aeration. Instances in which increased loads caused no corresponding increase in enzyme activity were correlated with failure of the process to increase in purification efficiency. (Stapinski-IPC)
W73-12535

EFFLUENT TREATMENT IN PAPER AND BOARD MILLS.

International Paper Board Industry, Vol 15, No 1, p 27-28, 30, January 1972.

Descriptors: *Waste water treatment, *Pulp and paper industry, *Reviews, Effluents, Recycling, Waste treatment, Biochemical oxygen demand, Biological treatment, Suspended solids, Solids contact processes, *Pulp wastes, Industrial wastes, Waste treatment, Treatment, Water pollution, Water pollution treatment, Water reuse, Mixing.
Identifiers: *White water, Board mills, Paper mills, Paper machines.

Methods of treating aqueous effluents from paper and board mills are reviewed, including recycling of paper machine waste waters (white waters), primary treatment to remove suspended solids, secondary or biological treatments to reduce biochemical oxygen demand, premixing of wastes, and treatment of condensates. (Witt-IPC)

WASTE TREATMENT PLANT AT ITT RAYONIER INC. MILL, FERNANDINA BEACH, FLORIDA.

Southern Pulp and Paper Manufacturer, Vol 35, No 7, p 36, 38, 40, July 10, 1972. 3 fig.

Descriptors: *Pulp wastes, *Waste water treatment, *Sulfite liquors, Pulp and paper industry, Florida, Effluents, Water pollution control, Industrial wastes, Bleaching wastes, Pollution abatement, Evaporation, Incineration, Recycling, Water reuse.
Identifiers: *Raycycle process, *Sulfite mills, Sulfite pulping, Bleach plants, Chemical recovery.

A schematic description is given of the 'Raycycle' process for treating aqueous wastes of a sulfite dissolving pulp mill. The new process combines spent pulping liquors with effluents from the bleach plant's hot caustic extraction stage for subsequent joint evaporation, combustion, and chemical recovery to reduce the pollution load of the treated effluent. (Witt-IPC)

RAYONIER MAKES MAJOR BREAKTHROUGH IN SULFITE POLLUTION CONTROL.

Paper Trade Journal, Vol 156, No 20, p 50-51, May 15, 1972. 2 fig.

Descriptors: Pollution abatement, Pulp and paper industry, Water pollution treatment, Evaporation, Effluents, *Pulp wastes, Bleaching wastes, Incineration, Sulfite liquors, *Treatment facilities, Chemcontrol, Water pollution, *Florida, Waste water treatment.
Identifiers: *Sulfite pulping, *Chemical recovery, Spent sulfite liquors, Alkaline extraction, Bleaching, Combustion, Spent liquors, Sulfite mills, Raycycle process.

ITT Rayonier Inc. has developed a new pollution control process called 'Raycycle', as part of a program to control water pollution at its Fernandina Beach sulfite pulp mill near Jacksonville, Florida. In this process, the spent sulfite pulping liquor is combined with the effluent from the alkaline extraction stage of the pulp bleaching sequence, and the joint waste waters are evaporated, burned, and subjected to a chemical recovery and regneration process. (Witt-IPC)

INVESTIGATIONS ON WASTE WATER CLARIFICATION WITH ACTIVATED CARBON (UNTERSUCHUNGEN ZUR RESTABWASSERKLARUNG MIT AKTIVKOHLE),
Technische Universitaet, Darmstadt (West Germany). Wasser- and Abwasserforschungsstelle.
H-L. Dalpke.
Das Papier, Vol 26, No 1, p 4-10, January, 1972. 10 fig, 2 ref.

Descriptors: *Waste water treatment, *Pulp wastes, *Activated carbon, Adsorption, Effluents, Pulp and paper industry, Foreign research, Europe, Effluents, Water pollution treatment, Waste treatment, Industrial wastes, Waste waters (Pollution), Pollution abatement, Water pollution control, Color, Organic matter, Pollutants, Biochemical oxygen demand, Physical control, Chemcontrol.
Identifiers: *Cellulose, Cellulose fibers, *Germany.

The removal of biologically harmful substances, characterized by their consumption of oxygen, from pulp and paper mill effluents is essential to the preservation or restoration of waterways. In addition to biological purification methods, several chemical and physical processes for reducing the five-day biochemical oxygen demand of industrial effluents have been suggested. Adsorption of pollutants on activated carbon is one of the more promising methods. This process has been investigated in several laboratory experiments in which mill effluents were subjected to the action of activated carbon contained in four sequential cylindrical vessels. Under the experimental conditions used, effluents could be completely decolored at specific flow rates of 1.5 liters per hr per kg of activated carbon. In addition, this treatment completely eliminated residual papermaking fibers and reduced the average five-day biochemical oxygen demand to 25 mg of oxygen per liter, or less. The technique and the apparatus used are described and illustrated. Their theoretical operating principle is also explained, notably various kinds of adsorption mechanisms. (Wise-IPC)

PRACTICAL DECOLORIZATION OF KRAFT MILL EFFLUENTS (PRAKTYKA USUWANIA BARWY SCIEKOW POSIARCZANOWYCH),
Instytut Celulozowo-Papierniczy, Warsaw (Poland).
C. Leszczynski.
Przeglad Papierniczy, Vol 28, No 3, p 88-89, March, 1972. 1 fig, 13 ref.

Descriptors: *Pulp wastes, *Color, *Lime, *Waste water treatment, Pulp and paper industry, Effluents, Chemical precipitation, Recycling, Pollution control treatment, Water quality control, Sedimentation, Bleaching wastes, Dewatering, Calcium carbonate, Calcium compounds, United States, Reviews.
Identifiers: *Kraft mills, Decoloration, Lignin, Tannins, Bleach plants, Chemical recovery, Causticizing.

Waste waters discharged by sulfate-process (kraft) pulp and paper mills contain color bodies comprising mainly lignin derivatives and tannins. In the concentrations currently encountered in natural waters, these materials are not toxic to aquatic organisms, but they interfere with the penetration of sunlight and with recreational water use, and raise the costs of effluent treatment. The activated sludge process does not effectively degrade color bodies. Among other treatment methods, such as chemical precipitation, adsorption on activated carbon, and reverse osmosis, only the lime process is deemed practical for industrial large-scale use. Developed and patented in the USA, it involves mixing of the effluent with lime and sedimentation of the resulting precipitate, followed by dewatering to 40-60% dryness for recycling to the causticizing plant of a kraft mill. Three American kraft mills have already introduced this process, namely, Interstate Paper Corp. at Riceboro, Georgia, Georgia-Pacific Corp. at Woodland, Maine, and Continental Can Co. at Hodge, Louisiana. Operating experiences at these three locations are described. Also mentioned are pilot plant investigations at International Paper Co. and American Can Co. regarding lime treatment for decoloring of bleach plant effluents, as well as on modifications of kraft pulp bleaching processes aimed at reducing the load of colored substances in waste waters. ENVIRONMENTAL CARE AT PULP MILLS, RESULTS AND EXPECTATIONS,
National Swedish Environment Protection Board, Stockholm. Environmental Care Project.
K-E. Lekander.
Svensk Papperstidning, Vol 75, No 1, p 5-14, January 15, 1972. 17 fig, 2 tab.

Descriptors: *Pulp and paper industry, *Foreign research, *Pollution abatement, Governments, Water reuse, Oxygen, Treatment, Economic impact, Research and development, Budgeting, Industrial wastes, Water pollution treatment, Waste treatment, Waste water treatment, Europe.
Identifiers: *Sweden, Kraft mills, Sulfite mills, Bleaching, Condensates.

Several of the research projects currently conducted by the Swedish National Environmental Protection Board (SSVL) under a five million dollar budget for the years 1970-1973 are discussed. They concern water recirculation in a closed kraft pulp and paper mill system; the same system in combination with oxygen bleaching; the reuse of overflows and accidental spill waters; and the treatment of condensates at kraft and sulfite mills. Results expected of these studied should permit new mills to be constructed from 1976 on to operate essentially free of water pollution without endangering their competitive market position. (Brown-IPC)

VOLATILE BIOCHEMICAL OXYGEN-CONSUMING MATERIALS OCCURRING IN THE SULFITE PROCESS WITH LIQUOR NEUTRALIZATION AND CONDENSATE RECOVERY: THEORETICAL STUDY, (FLYKTIGA BIOKEMISK SYREFORBRUKANDE AMNENS UPPTRADANDE I SULFITPROCESSEN VID LUTNEUTRALISERING OCH KONDENSATATERFORING, TEORETISK UNDERSOKNING),
Angpanneforeningen, Stockholm (Sweden).
O. Axelsson, and L. G. Wahlund.
Svensk Papperstidning, Vol 75, No 8, p 287-296, April 30, 1972. 9 fig, 9 tab. English summary.

Descriptors: *Pulp wastes, *Sulfite liquors, *Water reuse, Water pollution control, Industrial wastes, *Waste water treatment, Evaporation, Neutralization, Biochemical oxygen demand, Recycling, Theoretical analysis, Water pollution, Pollutants, Byproducts, Hydrogen ion concentration, Water conservation.
Identifiers: Sulfite pulping, Spent sulfite liquors, Condensates, Acetic acid, Furfural, Methanol, Chemical recovery.

A theoretical calculation was made of the effects to be expected in sulfite pulp mills in which spent sulfite liquor is neutralized and recycled to the wood digester along with recovered evaporator condensates obtained at different liquor pH and with varying degrees of condensate reuse. Complete closing of the liquor cycle was found to be impossible, because the volume of condensates exceeds the water demand of the acid-making (cooking liquor preparation) system. Excess condensates may conceivably be reused as wash water in a sectional spent liquor recovery system, a major proportion being introduced into the dilute ('thin') liquor, while a minor portion would accompany the washed pulp and be lost down the screen room sewer. The neutralization of thin liquor affects only the acidic impurities and should decrease the biochemical oxygen demand by up to 50%. The same effect upon acetic acid is obtained when condensate is recycled. This should decrease sewer losses of methyl alcohol and furfural to 15%, since a part of these compounds will be entrained by flue gases in the acid-making stage. By combining the neutralization of thin liquor with recycling of condensates, the acetic and formic

acid losses could be limited to about 10% of the total amounts formed, so that only about 10% of all oxygen consuming volatiles would be discharged with the mill's aqueous effluent. (Brown-IPC)
W73-12546

MICROBIOLOGICAL TREATMENT PARAMETERS OF BLEACHED KRAFT PULP MILL EFFLUENTS,
British Columbia Research Council, Vancouver.
C. C. Walden, A. E. Birkbeck, and J. C. Mueller.
Pulp and Paper Magazine of Canada, Vol. 73, No. 6, p 49-54 (p T153-T158), June, 1972. 9 fig, 14 ref.

Descriptors: *Pulp wastes, *Biological treatment, *Waste water treatment, *Activated sludge, Biochemical oxygen demand, Fermentation, Biodegradation, Microbiology, Microorganisms, Effluents, Pulp and paper industry, Sludge, Bleaching wastes, *Canada.
Identifiers: *Kraft mills, Kraft pulping, Process variables, Continuous process, Batch process, *British Columbia.

The microbiological treatment of effluents from a bleached kraft pulp mill requires acclimation of the inoculum. Even modest changes in biochemical oxygen demand result in major losses of acclimated sludge solids. Similar effects were not evident in the conventional five-day BOD test, owing to effluent dilution. For a bleached kraft mill effluent, the five-day BOD was found to measure only 0.84% of the thirty-day BOD. Batchwise and continuous fermentations of effluents from various coastal and inland kraft mills in British Columbia were conducted in order to elaborate various process paramenters of a low-rate activated sludge process with 24-hr detention time. Disperse sludge growth, albeit highly active, was observed with some effluents from an inland mill. However, this may be attributable to the individual samples examined, rather than to the low-rate 24-hr detention system. (Brown-IPC)

ADVANCED POLLUTION ABATEMENT TECHNOLOGY IN THE PULP AND PAPER INDUSTRY.
Organization for Economic Co-Operation and Development, Paris (France).

Document No. 86020, 1972. 223 p, 3 fig, 5 tab, 15 annexes.

Descriptors: *Pulp and paper industry, Water pollution, *Pollution abatement, Technology, *Economic feasibility, Water pollution treatment, Air pollution, Economic impact, Economic efficiency, Costs, Economic impact, Water reuse, *Waste water treatment, Pulp wastes, Bleaching wastes, Oxygen, Industrial wastes, Effluents, Color, Research and development, Sulfur compounds, Chlorine compounds, Water conservation, Foreign research, Pollutants, Waste water (Pollution).
Identifiers: *Bleaching, *Pulping, Sulfite pulping, Kraft pulping, Pulp washing, Counter-current processes, Chemical pulping, Oxygen bleaching, Mechanical pulping, Newsprint.

An international study by OECD experts on paper industry water and air pollution problems and control technologies arrived at the following major conclusions: Presently accepted in-plant techniques can cut pollution loads in older pulp and paper mills by about 50%. External treatments can decrease effluent pollution loads by 75 to 90%. A 90% reduction of wastes may add $7 to $9 to the cost per ton of bleached kraft pulp. Current efforts to develop pulping and bleaching processes without use of sulfur and chlorine compounds should eliminate odorous air emissions, reduce water consumption, and permit recycling of bleaching effluent. The oxygen bleaching process holds particular promise for controlling effluent color. Improved mechanical (groundwood) pulping methods, while conserving raw material, can minimize the need for chemical pulps in newsprint furnishes. Water requirements and pollution loads are being reduced also by use of countercurrent washing techniques. These and other innovations will require significant research and development expenditures by the paper industry. Their impacts should become felt within 15-20 years. The color removal problem may be solved within a decade. Detailed evaluations are presented of various laboratory and pilot stage approaches with regard to commercial feasibility and economic and environmental implications. (Brown-IPC)

ACTIVATED SLUDGE TREATMENT WITH OXYGEN,
Robert A. Taft Water Research Center, Cincinnati, Ohio.
J. B. Stamberg, D. F. Bishop, and G. Kumke.
Available from NTIS, Springfield, Va. 22151, as PB-214 564 Price $3.00 printed copy; $1.45 microfiche. Report, March 1971. 29 p, 6 fig, 5 tab.

Descriptors: *Waste water treatment, *Municipal wastes, *Activated sludge, *District of Columbia, Pilot plants, Research and Development, Methodology, Oxygenation, Sludge treatment, Solid wastes, Suspended solids, Aeration, Biochemical oxygen demand, Water quality control.
Identifiers: Solids retention time.

The Environmental Protection Agency Washington, D.C., Pilot Plant has been evaluating the oxygen-activated sludge treatment process since May 1970. An oxygen-activated system, consisting of a unique gastight biological reactor with less than 2.5 hours of aeration time and gravity clarification, produces effluents comparable in BOD and suspended solids to those of a parallel diffused aeration system with an aeration time of 3.6 hours. Consistently over 95% of the supplied oxygen was utilized in the reactor which employed co-current liquid and gas flow contacting. The mixed liquor suspended solids were maintained between 4,000 and 6,000 mg per liter. The mixed liquor increased to over 8,000 mg per liter when operated with alum addition for phosphorus removal. The underflow solids concentrations were between 1.0% and 1.4% without alum and 2.14% during the alum addition period. Visually, the microbial organisms were essentially the same as a typical conventional system; however, their rate of activity was greater above a solids retention time (SRT) of 6 days. The total production of solids was significantly less than the similarly operated diffused air system above an SRT of 6 days. As little as 0.35 lb of solids/lb of BOD was produced at an SRT of 13 days. Filamentous growth was observed below an SRT of 5 days, but not above. In warmer temperature periods, peak overflow rates of 1,940 gal per day per sq ft were observed. In the colder temperature periods, overflow rates of 975 gal per day per sq ft were the maximum obtained during the first year's operation. (Woodard-USGS)
W73-12586

TREATMENT OF SOYBEAN OIL SOAPSTOCK TO REDUCE POLLUTION,
Agricultural Research Service, Peoria, Ill. Northern Regional Research Lab.
R. E. Beal, V. E. Sohns, and H. Menge.
J Am Oil Chem Soc. Vol 49, No 8, p 447-450. 1972.
Identifiers: Broiler feed, Pigmentation, Pollution, Soapstock, *Soybean oil, *Waste water treatment.

Often soapstock is acidulated to convert this byproduct of vegetable oil refining to a salable commodity. The acidic waste water from this treatment constituted a significant part of the environmental pollution from refineries. A process of neutralizing and drying was investigated as a nonpolluting method for upgrading soybean oil soapstock. Neutralization with sulfuric acid was conducted in a ribbon blender. The neutral soapstock was dired to 4% moisture, either batchwise in a natural circulation evaporator or continuously in a scraped film evaporator. The product is liquid while hot but solidifies to a waxy solid when cooled to room temperature. When added to a standard broiler ration, the feed efficiency and rate of gain of chickens equaled that obtained with a commercial feed fat added at the same level. The soapstock products feed, which contained 200-300 ppm xanthophyll, gave significantly better shank pigmentation than the commercial fat, which contained 3 ppm.--Copyright 1973, Biological Abstracts, Inc.

Bumazhnaya Promyshlennost, No 1, p 14-16, January 1972.

Descriptors: *Pulp wastes, *Waste water (Pollution), *Discharge (Water), *Legal aspects, Pulp and paper industry, Effluents, Treatment, Aeration, Biodegradation, Biochemical oxygen demand, Foreign countries, Water pollution control, Pollution abatement, Industrial wastes, Water pollution treatment, Pollutants, Discharge frequency, Toxicity, *Waste water treatment, Water quality control, Fish, Aquatic lire, Costs, Feasibility studies, Economic feasibility, Water pollution, Waste dilution, Water law, Stream pollution.
Identifiers: *Amur River, *Lignin, USSR.

Soviet government regulations for permissible discharges of pulp and paper mill effluents are criticized as unrealistic. Thus, the Amur River Mills may unload their waste waters only during six months of the year, and the five-day biochemical oxygen demand of discharged wastes must not exceed 2 mg per liter. This requirement could not be met, despite costly storage facilities, because of the slow biodegradation of alkali lignin. Even prolonged aeration will not reduce the five-day biochemical oxygen demand of kraft mill wastes below 5 to 6 mg per liter. Experimental evidence suggests this level to be harmless to water quality and to fish, particularly when additional purification is used to eliminate toxic constituents for which the biochemical oxygen demand is a poor indicator. Recommendations for realistic effluent treatments are made, depending on various feasible dilution factors and upon the dynamics of the receiving waters (flowing streams versus stagnant waters). Identifiers: *Agriculture, Algae, Animals, Fish, *Human wastes, Reuse, *Wastes reuse.

More than 90% of materials used by man are wasted to the environment. Asian farmers recycled human and animal wastes on farms for centuries. Human excreta was a preferred fertilizer for vegetable and fish farming. The farmer effected increased yields at a lower cost and improved the urban environment through water pollution control. The uses, benefits, and health hazards resulting from human excreta on the farm are described. The Applied Scientific Research Corporation of Thailand and the Asian Institute of Technology jointly investigated the production of algae by using an open pond fed with sewage. The effluent was distributed to fish production ponds. The fish utilized the algae and other organisms in the treated waste water as a source of nutrients.--Copyright 1973, Biological Abstracts, Inc.

MICROBIOLOGY IN THE AEROBIC TREATMENT OF FARM WASTE,
Reading Univ. (England).
J. M. Grainger.
Process Biochemistry, Vol 8, No 3, p 28-30, March 1973. 28 ref.

Descriptors: *Farm wastes, *Waste water treatment, *Isolation, *Microbial degradation, *Methodology, *Aerobic treatment, Protozoa, Waste disposal, Aerobic bacteria, Pathogenic bacteria, Microscopy, Slurries, Waste dilution, Reviews, Incubation, Sewage bacteria, Temperature, Pollutant identification.
Identifiers: *Enumeration, *Heterotrophic microorganisms, Culture media, Staining, Sample preparation, Homogenization, Inoculation, Agars, Vorticella.

Procedures are reviewed for the enumeration and isolation of heterotrophic microorganisms of aerobic systems for treatment of farm slurry. An introduction to the subject is presented based largely on accepted microbiological practice. Areas of consideration are microscopical procedures and isolation methods including handling of samples, dilution and homogenization, media composition, inoculation methods, and temperature and period of incubation. (Mortland-Battelle)

LAND DISPOSAL OF LIQUID SEWAGE SLUDGE: I. THE EFFECT ON YIELD, IN VIVO DIGESTIBILITY, AND CHEMICAL COMPOSITION OF COASTAL BERMUDAGRASS (CYNODON DACTYLON L. PERS.),
Guelph Univ. (Ontario). Dept. of Land Resource Science.
D. King, and H. D. Morris.
J Environ Qual. Vol 1, No 3, p 325-329, 1972, Illus.
Identifiers: Bacteria, *Bermuda grass, Chemical composition, Coliform, Cynodon-Dactylon, Digestibility, Disposal, Fertilizer, Grass, *Land disposal, Potassium, *Sewage sludge, Yield, Zinc, *Sludge disposal.

The disposal of liquid sewage sludge on established Coastal bermudagrass sod was studied over a 2-yr period. Rates of sludge application up to 20 cm/yr were compared with a conventional fertilizer treatment. In 1969 there were no significant differences among the 3 highest sludge rates

and all sludge rates were superior to chemical fertilizer (224n37-97 kg/ha NPK) in forage production. In 1970 no significant differences were found among the 3 top rates of sludge and a higher rate of chemical fertilizer (358-112-224 kg/ha NPK) that was used. Sludge applications had little effect on in vivo digestibility of the forage. The K level of the forage was initially increased by sludge applications but steadily declined during the last half of the 1969 season and the entire 1970 season. Sludge applications increased the N and Na level of the forage but had little or no effect on P, Ca, Mg, Mn, B, Cu, Mo, and Ni. Zn content of the forage increased with increasing sludge rate and number of application through the second clipping in 1970. Although Zn levels of 340 ppm were fouund no reduction in yield resulted. There was no significant survival of coliform bacteria on the forage at harvest. Coastal bermudagrass is a well-adapted crop for sludge disposal areas.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Sludge disposal, *Soil treatment, Agriculture, Industrial wastes, *Pulp wastes, Sludge, *Wood wastes, Capital costs, Operating costs, *Incineration, Burning, Drying, *Crop production, Decomposing organic matter, Effluents, Odor, Phytotoxicity, Solid wastes, *Washington.
Identifiers: Cattle feed, Cattle bedding, Nematode control, Morel growth, Synthetic potting media, Camas (Wash).

The disposal of pulp and paper mill sludge in a manner which has minimal effect on the environment has become a serious problem. Four methods of disposal were evaluated, namely: (1) incineration in an air entrained dryer-incinerator, (2) burining in hog fuel boilers, (3) incorporation into soil as an amendment, and (4) hydromulching for soil stabilization. Other possible uses are discussed. Burning sludge in incinerators costs between $11 and $13/dry ton, including all prior dewatering steps. Sludge can be made available at various degrees of dewatering at costs of from $7 to $20/dry ton. Incorporation into farm soil offers the possibility for disposal of large quantities of sludge. At low levels (100-200 tons/acre) crop yields are satisfactory, provided adequate nitrogen is added. A high level incorporation (600 tons/acre) requires a year of fallow preceding crop planting. Sludge alone or in combination with bark can be used as a hydromulch in establishing grass stands on steep embankments. (EPA)

DELAWARE ESTUARY, PENNSYLVANIA, NEW JERSEY, AND DELAWARE, LONG-RANGE DREDGED SPOIL DISPOSAL PROBLEM.
Committee on Tidal Hydraulics (Army), Washington, D.C.

U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, May 1968. 28 p, 3 pl.

Descriptors: *Dredging, *Spoil banks, *Shoals, *Pennsylvania.
Identifiers: *Delaware Estuary, *Navigation channels, Marcus Hook (Penn).

A large part of recurring shoaling occurs in the vicinity of Marcus Hook, Pennsylvania. Both banks of the waterway in this locality are extensively developed, making the disposal area problem especially acute. Views of the Committee on Tidal Hydraulics are given on the following points: Sources of material in the Marcus Hook shoal; composition of Marcus Hook shoal; mechanics of deposition of the shoal at Marcus Hook; industrial use of water; correlation of volumes contributed and volumes of shoaling; beneficial use of materials in disposal areas; dehydration of disposal areas; and low density of effluent from dredge pumps. There will be no remaining capacity for disposal in a relatively short time if present procedures for dredging and disposal continue and if heavy shoaling continues in the reach. Discussion is given of possible measures to resolve the problem. These measures are: (a) Materially reduce contributions of shoaling material from the various sources; (b) Undertake works in the estuary that will cause transfer of most of the shoaling far downstream where disposal area capacity is available to meet the needs for many years; (c) Dredge the shoals in the critical reach, but transport the spoil by barge or pipeline to distant disposal areas. SURVEY OF INDUSTRIAL WASTE INJECTION WELLS, VOLUME II,
Missouri Univ., Rolla. Dept. of Geological Engineering.
D. L. Warner.
Available from NTIS, Springfield, Va. 22151, as AD-756-642 Price $9.00 printed copy; $1.45 microfiche. Final Technical Rept, June 1972. 677p. USGS 14-01-001-12280.

Descriptors: *Waste disposal wells, *Disposal, *Injection wells, Louisiana, Michigan, New Mexico, Nevada, New York, North Carolina, Ohio, Oklahoma, Pennsylvania.

This report consists of 246 forms describing individual wastewater injection well that have been inventoried. A table (in Volume I) lists the 22 states in which wells are known to exist and the number of wells inventoried. The forms are grouped by state and arranged approximately chronologically within each state. All wells that have been constructed for injection of industrial wastewaters into saline water aquifers were included. In addition to operative wells, some of the wells in the survey have never been operated; others have been operated, but are now inactive or abandoned. Oil field brine injection wells are not included, nor are wells used exclusively for injection of sewage effluent. Volume II contains information for Louisiana, Michigan, New Mexico, Nevada, New York, North Carolina, Ohio, Oklahoma, and Pennsylvania. (See also W73-12051) (Knapp-USGS)

Descriptors: *Sludge treatment, *Dewatering, Effluents, Pulp wastes, Pulp and paper industry, Biological treatment, Waste water treatment, Sediments, Pressure, Suspended solids, Coagulation, Chemcontrol, Storage, Reservoir storage, Freeze drying, Winter, Pressure, Flotation, Polymers, Waste disposal, Sludge disposal, Foreign research.
Identifiers: Compressed air, Aluminum compounds, Polyacrylamide, Kraft mills, USSR.

The aqueous effluents from the Baikal kraft pulp and paper mill are subjected to biological purification and subsequent coagulation with aluminum hydroxide sol. The resulting sediment comprises 13-14 percent of the effluent volume and contains 99.7-99.8 per cent water in addition to lignin, fibers, and coagulant solids. This sediment is transferred to a storage area and allowed to freeze in winter to reduce its volume by a factor of 40-50. Among various methods investigated for improving the dewatering efficiency, the most satisfactory results were obtained with pressure flotation of the kind widely used in the petroleum industry.

This process involves essentially the saturation of the sludge with compressed air, followed by sudden pressure release. The evolving air bubbles float the solid particles to the surface. In the pilot plant installation described, the application of air under 2 atm pressure was following by addition of polyacrylamide as coagulant in amounts of 3.1 to 0.5 mg per liter. This reduced the water content of the sediment by 95.1 to 95.7 per cent, while reducing the total sediment volume by a factor of 22 to 24. The liquid separated from the sludge contained only 2.7 to 6.0 mg of suspended solids per liter and could be disposed of without further treatment. (Stapinski-IPC)

WASTE DISPOSAL WELL PERFORMANCE,
Monsanto Biodize Systems, Inc., Great Neck, N.Y.
R. W. Payne.
Water and Wastes Engineering, Vol 7, No 7, p D-14 - D-18, July 1970. 4 fig, 7 ref.

Descriptors: Deep well disposal, *Injection wells, *Waste disposal wells, *Waste water disposal, Industrial wastes, Hydraulics, Permeability, Reservoirs.
Identifiers: *Injection horizon, *Semi-infinite aquifers, Intrained solids, Well development.

After a waste disposal well has been receiving water for a period of time, the injection pressures may be expected to rise. The wells performance must be analyzed to determine what fraction of the total increase is geologically inevitable so that the necessity and benefits of clean out or remedial work can be determined. Mathematical methods are presented for analyzing and predicting the changes in an industrial waste disposal wells pressure-rate relationship with time. Although these methods are widely used by the petroleum industry their applicability is relatively unknown to operators of industrial waste wells. Terms relating uniquely to the petroleum industry have been eliminated. Calculations based on long term performance of a Monsanto waste disposal well are used to evaluate the well work-over. A graphic solution is given for developing similar data for short-term shut-in tests. (Smith-NWWA)

THE DESIGN AND OPERATION OF DEEP--WELL DISPOSAL SYSTEM,
Chemstrand Corp., Pensacola, Fla. Utilities Assistance Group.
B. T. Dean.
Journal Water Pollution Control Federation, Vol 37, No 2, p 245-254, February 1965. 7 fig, 2 tab.

Descriptors: Wells, *Injection wells, *Waste disposal wells, *Aquifer characteristics, Industrial wastes, Hydraulics, Recharge, *Artesian aquifer, Permeability, Cement grouting, Water pollution, Dissolved oxygen, Chemical oxygen demand, *Florida.
Identifiers: *Pensacola (Florida), *Well design, Salinity, Escambia River, Bio-oxidation waste treatment system, Liquid ion-exchange process.

Increased production of waste materials and the associated costs of surface disposal at the Pensacola, Florida plant of the Chemstrand Corp. caused management to seek new disposal techniques. In cooperation with the U.S. Geological Survey a high saline artesian aquifer at a depth of 1400 feet with a westward regional dip was chosen as a potential waste disposal zone. Upon the completion of test drilling it was determined by chemical and hydraulic analysis that the aquifer waters were compatible with the wastes and injection could be satisfactorily achieved. The disposal well system was completed, with modifications from the initial plan, to fit special conditions and the borehole was cemented from the barrier bed to the surface with the open portion completely intersecting the disposal zone. A shallow monitor well in an intermediate aquifer was completed to assure no vertical leakage from the pressurized disposal zone occurred. Subsequent operations have proven very acceptable and at present it appears that deep well disposal of aqueous wastes is an extremely satisfactory method because of its simplicity, finality and economy. (Smith-NWWA)
W73-12780

THE DISPOSAL OF WASTEWATER UNDERGROUND,
R. M. Winar.
Industrial Water Engineering, Vol 4, No 3, p 21-24, March 1967. 3 fig, 4 ref.

Descriptors: Wells, *Injection wells, *Waste disposal wells, Waste water disposal, *Underground storage, Water storage, Reservoirs, *Recharge, Permeability, Hydraulics, *Biochemical oxygen demand.
Identifiers: Salt cavities, Fracture zones, Hydraulic pressures, Chemical composition.

In recent years there has emerged an increasing awareness of the suitability of underground storage for wastes. Deep well injection into suitable aquifers as a prime method of industrial waste disposal has emerged from the slow, steady technological growth of the 1950s and has expanded rapidly in the last 10 years as indicated by the doubling of waste disposal wells between 1963 and 1966. Although 86% of the current disposal wells serve the chemical and refining industries, the great variety of effluents (brines, caustics, acids, plating liquors, chromates, cyanides, cooling waters, and a full range of organic-inorganic compounds) compatible with this disposal process indicates that many diverse industries i.e. metal fabricating, treating and plating, mining, paper and food processing will soon follow suit as the anti-pollution pressures of the public and government increase and the economics of this method become more and more favorable when compared to the costs of a surface treatment and disposal. IMPACT OF WATER FLUORIDATION ON DENTAL PRACTICE AND DENTAL MANPOWER,
Illinois Univ., Chicago. Coll. of Dentistry.
B. L. Douglas, D. A. Wallace, M. Lerner, and S. B. Coppersmith.
J Am Dent Assoc. Vol 84, No 2, p 355-367, 1972.
Identifiers: *Dental practices, *Fluoridation, Manpower, Water supply, Potable water.

Dentists in F-deficient communities appear to be busier in their practices than dentists in fluoridated communities, who feel less overworked and spend more time on each patient. Dentists in fluoridated communities earned larger gross and net incomes in 1965, even with degree of specialization, effort, etc., held constant. The differential persisted, even though it was reduced in a 1967 income survey. Fluoridation appears to extend the existing pool of dental manpower to cover a substantially larger population.--Copyright 1973, Biological Abstracts, Inc.

VIRUSES IN METROPOLITAN WATERS: CONCENTRATION BY POLYELECTROLYTES, FREEZE CONCENTRATION, AND ULTRAFILTRATION,
Chicago Board of Health, Ill.
S. H. Rubenstein, J. Fenters, H. Orbach, N. Shuber, and J. Reed.
Journal of the American Water Works Association, Vol 65, No 3, p 200-202, March 1973. 4 tab, 6 ref.

Descriptors: *Viruses, *Methodology, *Lake Michigan, Cultures, Bacteria, Surface waters, Water analysis, Streptococcus, Pollutant identification.
Identifiers: Concentration, *Freeze concentration, *Polyelectrolytes, *Ultrafiltration, Natural waters, Recovery, Sample preparation, Culture media, Plaque assay, Collaborative studies, Coxsackie B4 virus, Echo 6 virus, Poliovirus 1-Sabin, Isobutylene maleic anhydride, *Chicago River (Ill).

A collaborative study was conducted to compare viral concentration methodologies and to elicit data related to the viral status of Lake Michigan. One laboratory employed a concentration method utilizing an insoluble cross-linked polyelectrolyte of isobutylene maleic anhydride (IMA). The second laboratory used a method of freeze-concentration and ultrafiltration. In both cases, experimental model systems, seeded with poliovirus and echovirus, were operated in the laboratory and actual samples form Lake Michigan filtration plants and the Chicago River were tested. The recovery and concentration of viruses were shown to be practical, simple, and efficient with either method. Both allow for the processing of large volumes of water with minimum manipulation and a high degree of certainty of viral recovery. In the testing of actual samples, no viral agents were detected in Lake Michigan samples and only one Echovirus isolate was yielded by Chicago River samples. (Mortland-Battelle)

REGIONAL SEWER SYSTEM, PLANNING AND COST ESTIMATION MODEL,
Regional Planning Council, Baltimore, Md.
A. G. Leary, and P. Zepp.
May 1968. 35 p, 2 fig, 4 tab, 1 append. HUD-Md.-P-61.

Descriptors: *Sewers, *Cost analysis, *Computer programs, *Model studies, Land use, Design criteria, Planning, *Maryland, Regional analysis, Regional development.
Identifiers: *Baltimore.

The purpose is to further develop a computer model to design and evaluate alternative sewer systems. The study expands an earlier report prepared for the Regional Planning Council by Alan M. Voorkees and Associates, Sewer System Cost Estimation Model. The key inputs to the model are the land use patterns to be served, the general physical layout of the sewer system, and some engineering design criteria. Principal outputs are various design data for specific sewer lines, unit costs, and total system costs. Model can be used to test the effect on costs of various land use patterns or plans and to determine the most efficient sewer system given a specific land use pattern. A short description of the computer model, flow diagrams of the computer program, and the results of a test problem are included. (Elfers - North Carolina)

W73-12358

SUMMARY REPORT: COMPREHENSIVE SEWERAGE STUDY FOR SCHENECTADY COUNTY, NEW YORK.
Parsons, Brinckerhoff, Quade and Douglas, Inc., New York.

June 1970. 24 p, 4 fig, 7 tab. N.Y. State Dept. of Health WPC-CS-176.

Descriptors: *Sewerage, *Planning, Projections, Cost analysis, Water quality, Coordination, *New York, *City planning.
Identifiers: *Schenectady County (New York), Mohawk River, Sewerage system expansion.

Two sections of Schenectady County, the eastern section including the Schenectady Metropolitan area and the rural-oriented western section are discussed. In the eastern section there have been several previous sewerage studies and this study brings together their findings within a broad perspective. Particular attention was placed on the effect on water quality of the Mohawk River from wastewater disposal and the question of whether each community in the metropolitan area should treat and dispose its own wastewater or handle it on a multimunicipal basis. In the western section it is recommended that individual disposal systems continue to be used except for three community centers where small collection and treatment systems are needed. Population and sewage flow projections, maps showing proposed system elements, and cost estimates for several alternative systems are included. (Elfers - North Carolina)

INTERIM AREAWIDE WATER AND SEWER PLAN: BEL-O-MAR AREA.
Candeub, Fleissig and Associates, Newark, N.J.

Prepared for Bel-O-Mar Interstate Planning Commission, 1972. 56 p, 5 fig, 7 maps, 12 tab, 15 append. HUD West Virginia-84.

Descriptors: *Planning, *Water supply, *Sewerage, Land use, Environmental effects, Project planning, Administration, Coordination, *Ohio, *West Virginia, *Ohio River, *Interstate commissions, *Regional analysis.
Identifiers: Belmont County (Ohio), Ohio County (West Virginia), Marshall County (West Virginia).

Based on EPA and HUD requirements for areawide water and sewer plans, a planning framework and a short-range water and sewer project plan are presented for a three county area in Ohio and West Virginia. The most significant water resource in this area is the Ohio River, which is the primary water supply source and the receiving body of water for virtually all wastewater discharges. A detailed chart shows all significant intakes from and discharges into the river. Other topics include (1) the environmental impact of wastewater discharges; (2) existing water and sewer facilities; and (3) planning goals and objectives, existing land use patterns, and land use planning concepts. The short-range project plan is presented largely via tables listing specific projects and their costs and priorities. A long range policy plan on administration and financing also is presented. (Elfers - North Carolina)

SURVEY OF WATER TRANSPORTATION POTENTIAL TO REDUCE CONGESTION AND POLLUTION IN WASHINGTON, D.C. AND OTHER MAJOR CITIES.
Lulejian and Associates, Inc., Falls Church, Va.

Available from National Technical Information Service as COM-73-10253, $3.00 in paper copy, $1.45 in microfiche. Prepared for Department of Commerce, Maritime Administration, October 1972. 30 p, 20 fig. 2-36282 - Maritime Administration.

Descriptors: *Transportation, Navigation, Environmental effects, Economic feasibility, Hydrofoils, *Boats, Land use, Air pollution, *District of Columbia.
Identifiers: *Water transportation, Noise pollution.

The provision of transportation in large urban areas is increasingly becoming a major problem, especially in terms of efficiency and pollution. Water transportation offers a promising alternative because of the rapidly developing small boat technology, e.g. hydrofoils, and because most large cities are located on significant bodies of water. This alternative may also prove to be, as early studies indicate, better in terms of reduced noise levels and air pollution. This study focuses on Washington, D.C., and on the basis of travel patterns and various cost data, proposes and evaluates a water transportation system. Conclusions are: (1) such a system could be initiated in the near future, (2) it could be self-supporting, (3) it would have a minimal environmental impact, and (4) it would promote new commercial and recreational development along the waterways. (Elfers - North Carolina)

KAY COUNTY, OKLAHOMA, WATER AND SEWERAGE COMPREHENSIVE PLAN.
Evans and Nelson Engineering Co. and Associates, Ponca City, Okla.

Available from the National Technical Information Service as PB-213 565, $6.00 in paper copy, $1.45 in microfiche. Prepared for Office of Community Affairs and Planning, Oklahoma City, Oklahoma. June, 1972. 61 p, 28 fig, 10 tab. CPA-OK-06-56-1002.

Descriptors: *Water supply, *Sewerage, Rural areas, Data collections, *Oklahoma.
Identifiers: *Kay County (Okla), Inventories, Daw Dam (Okla), Kaw Reservoir (Okla).

Kay County in north central Oklahoma is rural with only a few small water and sewer systems. Groundwater is scarce except in areas adjacent to the Arkansas and Chickaskia Rivers. Impoundment of water in the Kaw Dam and Reservoir may provide water suitable for irrigation and industrial purposes and be a source of water supply for small communities. Basic data rather than plan and program formulation are presented as a first step in developing a water and sewer planning program for rural areas and cities under 5,000. Data include maps of existing water and sewer systems, maps of topography and soils, census data, political subdivision and land use maps, and descriptions of surface water and ground water resources in the county. (Elfers - North Carolina)
W73-12364

FUNCTIONAL WATER AND SEWERAGE PLAN AND PROGRAM, PEE DEE REGION, SOUTH CAROLINA.
LBC and W Associates, Columbia, S.C.

Available from the National Technical Information Service as PB-213 532, $10.25 in paper copy, $1.45 in microfiche. Prepared for Pee Dee Regional Planning and Development Council, Florence, South Carolina, May, 1972. 164 p, 31 ref. HUD-SC-04-00-0050 (g).

Descriptors: *Planning, *Water supply, *Sewerage, Urbanization, Land use, Comprehensive planning, Water demand, Environmental effects, Administration, Financing, *South Carolina, *Regional analysis.
Identifiers: Utility systems extension, *Pee Dee Region (South Carolina).

A continuing, comprehensive planning program concerned with facing problems of urbanization early before rapid urban growth occurs is being carried out by the Pee Dee Regional Planning and Development Council. The emphasis is not only one of providing adequate water and sewerage services, but also to plan these systems to help promote orderly patterns of growth. The study is closely related to population projections and land

ise planning and includes discussions of planning leterminants, goals and standards, environmental considerations, administration, and financial considerations. Each of the six counties in the region s analyzed separately for both water supply and sewerage systems. These analyses include an inventory of existing facilities, an analysis of water equirements and sewerage problems, and a proposed plan and program for water supply and sewerage. Analyses and plans are of a general nature due to the regional scope of the report and are argely based on previous planning and engineering studies made for individual jurisdictions. THE NIAGARA RIVER POLLUTION ABATEMENT PROGRESS - 1971.
Available from the National Technical Information Service as PB-213 683, $3.00 in paper copy, 1.45 in microfiche. International Joint Commission–United States and Canada, Summary Report, August 1971. 8 fig, 4 tab.

Descriptors: *Pollution abatement, *Water quality standards, *Comprehensive planning, New York, Canada, Water pollution control, Water pollution effects, Water pollution sources, International Joint Commission, Legislation, Regulation, Programs, Law enforcement, Monitoring, Financing, Grants, Planning, United States, Lake Erie, Lake Ontario, St. Lawrence River.
Identifiers: *Niagara River, Ontario (Canada).

Pollution abatement in the Niagara Area since 1967 has progressed so that it will ultimately be reflected by improved water quality in the Niagara River, however, total anticipated improvement will not be realized until all planned abatement measures are completed and operative. All New York municipalities are adding secondary and phosphorus removal facilities. New York industries that chose to provide their own waste control measures have made significant progress, although they have not always succeeded in meeting established completion schedules. Requirements of the Ontario Water Resource Commission have been met by most Canadian industries. Water quality of the Niagara River will be markedly improved by the cumulative effect of waste treatment and control measures underway by 1975. New York State programs in effect to abate pollution are enforcement, comprehensive sewage studies with implementation of a master plan, pure waters construction grants, incentive programs, surveillance, and legislative and administrative changes regarding boat pollution, phosphorus, thermal criteria, lateral sewer construction aid, pesticides, and bulk storage, transportation and handling of hazardous substances. The Province of Ontario control program includes assistance to municipalities, phosphorus control, enforcement and hearings, contingency planning for handling spills, marina and boating legislation, disposal of dredging spoil, herbicides and pesticides, and surveillance. CONTROL OF OIL AND OTHER HAZARDOUS MATERIALS.

Available from NTIS, Springfield, Va. 22151 as PB-213 880 - Price $6.00 printed copy; $1.45 microfiche. Environmental Protection Agency Publication, December 1971. 159 p.

Descriptors: *Water pollution sources, *Oil spills, *Chemicals, *Pollution abatement, Methodology, Transportation, Boats, Railroads, Highways, Water pollution control, Pollutants.
Identifiers: *Hazardous material spills.

More than two billion tons of potentially hazardous materials were produced and handled in the United States during 1968-1969. It is projected that the annual production quantities of these materials will approximate four billion tons in 1980. Over 70% of these quantities are transported by motor truck, railway, water barge, and pipeline. As long as the tonnage of liquid, solid and gaseous hazardous chemicals produced, handled, and transported by land and waterways continue to follow the present upward trend, the accidental spillage of these materials poses a real and growing threat of pollution to our water courses. Problems are discussed under the main topics: Hazardous Materials; Oil Spill Problem; Oil Characteristics; Oil Spill Prevention; Control and Treatment; and Legal Response. (Woodard-USGS)
W73-12427

VESSEL FOR THE REMOVAL OF OIL ON WATER,
S. Brydoy, and A. Sletsjoe.
U. S. Patent No. 3,737,040, 4 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 911, No 1, p 125, June 5, 1973.

Descriptors: *Patents, *Pollution abatement, Water quality control, *Oil pollution, *Oil spills, Skimming, Water pollution control, *Emulsifiers.
Identifiers: Barge-like vessels.

A vessel in the shape of a barge-like craft is used for carrying out both mechanical and chemical removal of oil from the surface of water. On each side of the intake section and extending in the normal direction of movement of the vessel, there are fastened sweeping arms which float on the water and direct the surface layer towards the intake. In the separation tank on board there is a skimmer for removal of floating oil. The skimmer is connected to a storage tank into which the oil may be pumped. Between the storage tank and the skimmer there may be inserted a container. The oil may then be pumped from the container to the storage minimizing the amount of air drawn into the pumping system. The dosaging device for the oil removing agent (emulsifier) is placed so that the agent may be sprayed or sprinkled down on the liquid. (Sinha-OEIS)
W73-12448

POLLUTANT RECOVERY SYSTEM,
J. J. Zerbe.
U.S. Patent No 3,734,294, 5 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 910, No 4, p 1174, May 22, 1973.

Descriptors: *Patents, Flotsam, *Oil spills, *Oil pollution, Equipment, *Pollution abatement, Water pollution control, Water quality control, Adsorption.
Identifiers: Polyurethane, Sorbent material.

A linkage of floats or booms is used to surround the pollutant floating on the water surface. It is placed down-wind or down-current to confine the pollutant to a small recovery area. The pollutant is seeded with a particulate, floatable sorbent material, such as granulated or ground polyurethane. Two seeder units are tethered to a platform and are available to distribute the sorbent material. The recovery device consists of a rotatable support with scoops mounted on it. The scoops are porous - allowing water to pass through but retain the sorbent material and adsorbed pollutants. Collection trays are positioned to receive the contents of the scoops to facilitate discharge of the contents of the scoops. (Sinha-OEIS)

COORDINATION OF AGRICULTURAL AND URBAN WATER QUALITY MANAGEMENT IN THE UTAH LAKE DRAINAGE AREA,
Colorado State Univ., Fort Collins. Environmental Resources Center.
W. R. Walker, T. L. Huntzinger, and G. V. Skogerboe.
Available from the National Technical Information Service as PB-222 280, $4.75 in paper copy, $1.45 in microfiche. Completion Report Series, Partial Report No 47, June 1973. 151 p, 24 fig, 21 tab, 23 ref. OWRR B-071-COLO (1).

Descriptors: Institutional constraints, Inter-basin transfer, *Mathematical models, *Optimization, Salinity, Urbanization, Waste water treatment, *Water quality, Water resources, Utah, *Water management (Applied), Model studies, *Cities, *Farm wastes.
Identifiers: *Utah Lake drainage area.

Like many other urbanizing river basins, the Utah Lake drainage area is faced with serious water quality degradation associated with expanding water use. While the region is not water-short, the downstream water users are encountering water deficiencies. To avoid aggravating these problems, water quality controls will be implemented in the Utah Lake drainage so that its future developments will not be harmfully reflected downstream. A model has been developed which optimized the allocation of water pollution abatement policies among agricultural and urban water uses. In addition, an analysis is made in which water quality management in areas surrounding Utah Lake is coordinated with the alternatives of lake diking and regional desalination. The results indicate that urbanization emphasizes control of urban pollution because of the inherent economies of scale in wastewater treatment facilities. On a basin-wide scale, desalting is the best strategy for future water quality management. (See also W73-12509 and W73-12510)
W73-12508

MATHEMATICAL MODELING OF WATER MANAGEMENT STRATEGIES IN URBANIZING RIVER BASINS,
Colorado State Univ., Fort Collins. Environmental Resources Center.
W. R. Walker, and G. V. Skogerboe.
Available from the National Technical Information Service as PB-222 281, $4.50 in paper copy,

$1.45 in microfiche. Completion Report Series Partial Report No 45, June 1973. 119 p, 16 fig, 1 tab, 32 ref. OWRR B-071-COLO (2).

Descriptors: Institutional constraints, *Mathematical models, Optimization, Systems analysis, Urbanization, Waste water treatment, *Water management (Applied), *Water quality, *Water supply, Model studies, Cities, *Colorado, *Utah, *Optimal development plans, Farm wastes.
Identifiers: *Arid-urbanizing areas, Denver (Colo), Utah Lake drainage area.

Water management in arid urbanizing regions requires careful evaluation of the alternative strategies for supplying future demands and control of water quality. Mathematical models were formulated to study the interrelationships that exist among various institutional factors in order to delineate the requirements for implementing optimal policies. Two study areas were selected on which to test the utility of the models. Denver, Colorado, was chosen as an area representing conditions of water scarcity and increasingly stringent water quality standards. The Utah Lake drainage area in central Utah presented conditions where water quality management is necessary to insure the continued use of water in the downstream population center of the state. Together these models produce results useful in determining the optimal strategies for water management in arid urbanizing areas. (See also W73-12508)
W73-12509

EVALUATION OF URBAN WATER MANAGEMENT POLICIES IN THE DENVER METROPOLITAN AREA,
Colorado State Univ., Fort Collins. Environmental Resources Center.
W. R. Walker, R. C. Ward, and G. V. Skogerboe.
Available from the National Technical Information Service as PB-222 282, $4.75 in paper copy, $1.45 in microfiche. Completion Report Series, Partial Report No 46, June 1973, 145 p, 30 fig, 1 tab, 34 ref. OWRR-B-071-COLO (3).

Descriptors: *Institutional constraints, Interbasin transfers, *Mathematical models, Optimization, Urbanization, Wastewater treatment, Water distribution systems, Water quality, Water resources, *Water reuse, Water treatment, *Colorado, *Cities, Model studies, *Optimal development plans, Water management (Applied).
Identifiers: *Denver (Colo).

A management level urban water system model has been developed to answer basic questions relating to optimal management of water in the urban environment. The model which coordinates water supply, distribution, and wastewater treatment is applied to the water management problems of the Denver, Colorado metropolitan area. Denver presently supplements diversions from the South Platte River with interbasin transfers, agricultural water right transfers, and groundwater. Although plans are being made to increase the capacity of these sources, increasingly stringent standards on wastewater effluents are enhancing the feasibility of reuse. In order to facilitate the implementation of optimal policies such as reuse, various institutional constraints must be evaluated. Certain of these including the legal interpretation of water rights, public opinions, management consolidation, and water quality control philosophies are explored. (See also W73-12508)

CONTROL OF MINE DRAINAGE FROM COAL MINE MINERAL WASTES - PHASE II - POLLUTION ABATEMENT AND MONITORING,
Consolidation Coal Co., Pinckneyville, Ill. Midwestern Div.
Z. V. Kosowski.
Copy available from GPO Sup Doc as EP1.23/2:73-230, $1.25; microfiche from NTIS as PB-222 252, $1.45. Environmental Protection Agency, Technology Seires Report, EPA-R2-73-230, May 1973. 83 p, 10 fig, 7 tab, 10 ref. EPA Project 14010 DDH.

Descriptors: *Mine drainage, Reclamation, Coal mines, *Illinois, Acid mine water, *Mine wastes, *Coal mine wastes, *Vegetation establishment, Erosion control, Air pollution, Water pollution control, Surries, Costs.
Identifiers: New Kathleen mine (Ill), Mineral wastes, Acid formation rate, *Refuse piles, *Slurry ponds.

Acid runoff from refuse piles can be controlled by covering the mineral wastes with soil, establishing a vegetative cover, and providing adequate drainage to minimize erosion. The average acid formation rate for the entire restored refuse pile was estimated at 16 lb acid as CaCO3/acre/day, or a reduction of 91+% when compared to the original unrestored pile. No significant differences were observed in acid formation rates from the 3 individual test plots covered with a nominal 1 foot, 2 feet, or 3 feet of soil. However, it was more difficult to physically place 1 foot of soil, especially on the steeper slopes. Slurry lagoons containing the fine coal rejects can be stabilized and the air pollution problem controlled by either a vegetative cover established directly on the mineral wastes without soil or by the application of a chemical stabilizer. Chemical stabilization is only a temporary measure, and vegetative covers should be the permanent solution to slurry lagoons. Cost data from this project indicate that it would cost approximately $6,100, $8,000, and $9,800 per acre to cover with grass a refuse pile with one, two, and three feet of soil respectively. (EPA)
W73-12516

STREAM QUALITY PRESERVATION THROUGH PLANNED URBAN DEVELOPMENT,
Regional Science Research Inst., Philadelphia, Pa.
R. E. Coughlin, and T. R. Hammer.
Copy available from GPO Sup Doc as EP1.23/3 73-019, $2.60; microfiche from NTIS as PB-222 177, $1.45. Environmental Protection Agency, Socioeconomic Studies Series Report, EPA-R5-73-019, May 1973. 227 p, 17 fig, 46 tab, 66 ref. EPA Project 16110 DYX.

Descriptors: Appraisals, *City planning, Flood plain zoning, Regional analysis, Intangible benefits, *Land appraisals, Water quality, *Land use, *Urban areas, Environmental effects, Channel improvement.
Identifiers: Land use controls, Runoff pollution, Preference analysis, *Open spaces, Stream quality preservation.

The effects of a land use plan to restrict urban development in areas critical to the water resource system are identified through empirical studies. Specifically, relationships are established between amount, density, type, and location of urban development, on the one hand, and stream water quality and stream channel enlargement on the other. The amount of open space with such a plan as compared to that with normal development is determined. Perception of water quality by untrained observers in the field and its relationship to overall site preference is studied and pilot studies are reported concerning the preferences of a sample of observers for various landscape characteristics. The evaluation of these effects is approached through household surveys designed to determine how use of and preference for stream sites is related to water quality of stream and distance of residence from stream. In addition, the effect of preserved open space on adjacent land values is explored empirically. (EPA)

ONTARIO UNHAPPY WITH EFFORTS OF INDUSTRY TO HALT POLLUTION,
R. Starks.
Canadian Pulp and Paper Industry, Vol 25, No 3, p 13-15, March 1972. 3 fig.

Descriptors: *Law enforcement, *Pulp and paper industry, *Canada, *Pollution abatement, Water quality standards, Water pollution control, Air pollution, Legal aspects, Water law, Governments, State governments.
Identifiers: *Ontario.

In contrast with the progress made in air pollution control by the Ontario pulp and paper industry, the slow rate at which the province's pulp and paper mills are fighting water pollution is causing grave concern to the Ontario Water Resources Commission (OWRC). Existing pollution control installations are deemed inadequate, and further pressure by OWRC should be expected. Legal action has commenced against companies that have not yet complied with the government's water quality regulations. (Witt-IPC)

Bumazhnaya Promyshlennost, No 4, p 14-15, April, 1972. 2 fig.

Descriptors: *Water pollution sources, *Industrial wastes, Streams, Rivers, Running waters, Pulp wastes, Textiles, Water quality, Water pollution, Waste waters (Pollution), Dissolved oxygen, Biochemical oxygen demand, Water analysis, Foreign countries, Settling basins, Discharge lines, Discharge (Water), Effluents, Surveys, Seasonal, Suspended solids, Self-purification, Waste dilution, Flow characteristics.
Identifiers: *Nara River (USSR).

1 km long stretch of the Nara River was surveyed in order to assess pollution loads contributed by the Serpukhov Paper Mill and by a synthetic textile fiber factory, as well as the seasonal self-purification capacity of the stream. Effluents were analyzed for discharge volumes, flow rates, chemical composition, and physical characteristics, as well as for downstream dilution. Dissolved oxygen did not vary greatly with flow rate, water temperature, or season, whereas the suspended solids content showed wide seasonal variations. The BOD was the most significant indicator of water quality and of self-purification. According to this criterion, the greatest source of pollution (37%) was the effluent from the horizontal sedimentation tank of the paper mill, followed by its second discharge outlet (29%) and by one of the textile factor's discharge pipes (22%). (Stapin-Witt-IPC)

CALIFORNIA POWER PLANT SITING STUDY: VOLUMES, I, II, AND III.
Holmes and Narver, Inc., Anaheim, Calif.

Contract Report HN-8145.3-.5 (UC-12), May 1973. 466 p, 72 fig, 45 plate, 52 tab, 309 ref, 4 append.

Descriptors: *Powerplants, *California, *Environmental engineering, Nuclear powerplants, Underground powerplants, *Environmental effects, Social aspects, Thermal pollution, Water pollution control.
Identifiers: Offshore powerplants.

The concept of locating powerplants inland ranks highest in overall acceptability and would utilize land of greatest abundance in California. The concept consistently ranks high in acceptability when compared with other concepts against only cost, environmental impact, feasibility, or risk individually. Underground locations are not competitive with the acceptability of aboveground plants; but if they are preferred for aesthetics or for any of the other factors studied, the most favorable is one located in a cut-and-cover situation in nonmassive or poorly cemented materials. Offshore locations are not competitive with the acceptability of aboveground plants. The floating plant in a vessel located in deep water is more acceptable than the other offshore concepts because of its lower cost and the length of coastline where deep water exists. (Knapp-USGS)

ENVIRONMENTAL IMPACT STUDY.
Ocean and Atmospheric Science, Inc., Dobbs Ferry, N.Y.

Available from NTIS, Springfield, Virginia 22151, as AD-754 458 Price $10.60 printed copy; $1.45 microfiche. Final Technical Report 72-116, November 1972. 418 p, 7 fig, 22 tab, 15 ref, 6 append. ONR N00014-72-C-0425.

Descriptors: *Environmental control, *Pollution abatement, *Pollutant identification, *Water pollution sources, Air pollution, Analytical techniques, Instrumentation, Laboratory tests, On-site investigations, Mass - spectrometry, Polarographic analysis, Electrodes, Chromatography, Federal government, State governments, Administrative agencies.

The Advance Research Projects Agency (ARPA) Environmental Impact Program is directed toward identifying those scientific and technical areas necessary to achieve satisfactory evaluation and abatement of the environmental impacts of Department of Defense (DoD) activities. The effort is directed toward high technology problems for which there are current voids not being adequately addressed by others and for which the environmental evaluations require considerable interservice and interagency participation. Several areas were identified and appear to be germaine for additional efforts by DoD and ARPA. These include: sensors and instrumentation, critical materials, environmental impact prediction facility, model base, and environmental management. (Woodard-USGS)

REPORT TO THE FEDERAL WORKING GROUP ON PEST MANAGEMENT FROM THE TASK GROUP ON CATEGORIZATION OF PESTICIDES USED BY THE FEDERAL GOVERNMENT.
Federal Working Group on Pest Management, Rockville, Md.

Available from NTIS, Springfield, Va. 22151 as PB-214 385 - Price $3.00 printed copy; $1.45 microfiche. Report-72-1, September 1972. 36 p, 2 append.

Descriptors: *Pesticides, *Pest control, *Federal Government, Water pollution control, Acaricides, Fumigants, Fungicides, Herbicides, Insecticides, Molluscicides, Piscicides, Rodenticides, Pollutant identification.
Identifiers: *Pesticides categorization, Federal pest control programs, Pest management.

The report is designed for use of federal agencies which require the use of pesticides. The intent is to tie pesticide usage with the proper training of personnel using pesticides and appropriate professional review of pest management programs. The report is to be used in conjunction with the report to the Working Group from the Task Group on Training Objectives and Standards (FWGPM-72-2). Both reports are applicable to federal pest management programs only and are not intended as guidelines for public regulatory agencies or for regulatory decisions. Categorization is presented for 184 pesticides used by the federal government during 1970, 1971, and 1972. The four categories are described. Criteria used for the categorization as well as the levels of required training and review for each category are also presented. (Woodard-USGS)

HEALTH STANDARDS FOR METALS IN DRINKING WATER,
National Environmental Research Center, Cincinnati, Ohio.
R. G. Tardiff.
In: Heavy Metals in the Environment; Proceedings of Seminar conducted by Oregon State University, Corvallis, Fall Quarter 1972: Oregon State University Water Resources Research Institution Report SEMN WR 016.73, p 113-139, January 1973. 10 fig, 2 tab, 10 ref.

Descriptors: *Water quality standards, *Potable water, *Public health, *Water pollution effects, *Heavy metals, Water Quality Act, Water pollution control, Water quality control, Industrial wastes, Municipal wastes, Pesticides, Toxicity, Regulation, Water policy, Water properties, Trace elements, Federal Government.

The evaluation of hazards from chemicals in drinking water and the setting of standards for these compounds are under the legal jurisdiction of the Environmental Protection Agency. The actual development of standards for these agents is directed by the Office of Water Programs with assistance of experts both inside and outside of the Agency. The National Environmental Research Center of Cincinnati, Ohio, is the focal point for EPA-directed research on the health aspects of chemicals in drinking water. The standards presently in force for chemicals in potable water were promulgated by the U.S. Public Health Service in 1962. These standards are listed and are compared with the proposed standards as revised by the Environmental Protection Agency. In discussing the biologic data which must be evaluated to set standards, and in emphasizing the necessity of current research, mercury and its

derivatives are used as examples. (See also W73-12604) (WoodarddUSGS)

FOULING ON EELGRASS (ZOSTERA MARINA L.),
Rhode Island Univ., Kingston. Graduate School of Oceanography.
J. McN. Sieburth, and C. D. Thomas.
Journal of Phycology, Vol 9, No 1, p 46-50, March 1973. 3 fig, 12 ref.

Descriptors: *Fouling, Diatoms, Marsh plants, Marine microorganisms, Marine plants, Marine algae, Chrysophyta, Electron microscopy, Salt marshes, Sampling, Rhodophyta, Fungi, Cyanophyta, Scuba diving, Marine bacteria.
Identifiers: *Cocconeis scutellum, Zoestera marina, *Colonization, *Eelgrass, Scanning electron microsopy, Macrophytes, Sample preparation, Spirulina.

The heavily fouled, immersed part of the blade, and the emersed portion of the blade undergoing fouling from mature, first-year plants collected by SCUBA from a brackish marsh were examined by scanning electron microscopy. The surface of young shoots emerging in the spring and the surface of mature blade tips immersed in the fall when examined at 500 to 2000x have a minimal scattering of coccoid and filamentous bacteria which are relatively insignificant in comparison to the colonization by pennate diatoms. Broken frustules and detritus adhere to form a crust which then becomes colonized nonselectively by a variety of microorganisms (stalked and colonial diatoms, filaments of red alga, a blue-green alga (Spirulina), a bacterium, and mycelia and sporangia of a fungus). Removal of the crust shows that the original 'cobblestone' surface of the eelgrass is obscured with a layer of deformed cells of Cocconeis scutellum which appears to be impressed into the epithelium. INDICATORS OF ENVIRONMENTAL QUALITY. PROCEEDINGS OF A SYMPOSIUM.

Philadelphia, Pa., Dec. 26-31, 1971. Plenum Press: New York, N.Y., London, England. 1972. W. A. Thomas, editor, 275 p, Map. Illus. Pr. $18.50.
Identifiers: Books, *Environmental quality, *Indicators, Plants, Pollution, Proceedings, Symposium.

Indicators and indices which measure variables and provide overall composite values for environmental shifts are examined, emphasizing the importance of developing a common denominator with which to assess the environment. The first group of papers covers the following topics: indicators of environmental quality; use of environmental indices in policy formulation; urban-environmental indicators in municipal and neighborhood policy planning and decision making; the obligation of the scientist to explain environment to the public; and evaluation of natural environments. The next group of papers covers the following topics: establishing priorities among environmental stresses; pollutant burdens in humans-a measure of environmental quality; aquatic communities as indices of pollution; plants as indicators of air quality; biochemical indicators of environmental pollution; and use of sense of smell in determining environmental quality. The final group of papers includes the following topics: outdoor recreational resources and land use shift; a water quality index; indices of air quality; statistically based air-quality indices; indicators of environmental noise; developing a soil quality index; environmental indices for radioactivity releases; and plant indicators in ecology.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Water pollution sources, *Industrial production, *Industrial wastes, *Indexing, Chemicals, Pollutants, Toxicity, Oxygen demand, Bibliographies, Environmental effects, Color, Odor, Eutrophication, Hardness (Water), Reviews, Water pollution control.
Identifiers: Manufactured products.

Data on the pollution potential of manufactured products are compiled in a catalog of three sections. These data are required for pollution control and for enforcement of environmental quality standards. Section I contains summary data consisting of product name, production rate, product lifetime, toxicity, oxygen demand, solids, color, odor eutrophication, oils and tars, and water hardness. Section II is a product listing. It summarizes, for each product, the chemical compositions of the product. Section III consists of a list of chemical ingredients of products, a bibliography, toxicity data, and oxygen demand data. (Knapp-USGS)

Environmental Protection Technology Series Report EPA-R2-73-179b-d, April 1973 (3 vol). EPA Contract 68-01-0102.

Descriptors: *Water pollution sources, *Industrial production, *Industrial wastes, *Indexing, Chemicals, Pollutants, Toxicity, Oxygen demand, Bibliographies, Environmental effects, Color, Odor, Eutrophication, Hardness (Water), Reviews, Water pollution control.
Identifiers: Manufactured products.

Data on the pollution potential of manufactured products are compiled in a catalog of three sections. These data are required for pollution control and for enforcement of environmental quality standards. Section I contains summary data consisting of product name, production rate, product lifetime, toxicity, oxygen demand, solids, color, odor, eutrophication, oils and tars, and water hardness. Section II is a product listing. It summarizes, for each product, the chemical compositions of the components of the product. Section III consists of a list of chemical ingredients of products, a bibliography, toxicity data, and oxygen demand data. (Knapp-USGS)

ENVIRONMENTAL COST OF MINING,
Bureau of Mines, Washington, D.C.
James E. Gilley.
In: Proceedings of the Council of Economics, American Institute of Mining, Metallurgical, and Petroleum Engineers, March 1-4, 1971, New York, p 99-109. 1 tab, 14 ref.

Descriptors: *Pollution abatement, *Mining, *Environmental effects, Costs, Water pollution control, Land subsidence, Mine drainage, Land reclamation, Acid mine water, Spoil banks, *Cost analysis, Estimated costs, Applachian Mountain Region.
Identifiers: Underground mining, Tailings, Coal fires, Cost effectiveness, Surface mining.

The environmental effects of underground and surface mining, and mineral or solid fuel processing and costs of alternative remedies are identified. In mining operations surface subsidence results from maximal extraction in order to realize optimum profits and conserve mineral resources. Control of the more insidious social cost of fires in abandoned mines and in virgin coal deposits has been attempted on a cooperative basis. More costly pollution problems are acid water drainage and sedimentation which imposes high costs to water users and results in serious aesthetic degradation, diminished aquatic life, and a decline in waterbased recreational use. Control is not only costly, but of limited effectiveness. Costs of necessary rehabilitation range from $304 million for correcting stream pollution and adverse soil conditions to $1.2 billion for development of surface-mined lands for specialized uses. The accumulation of solid wastes associtated with resource processing is expected to continue at an accelerating rate as resource demands increase and the quality of remaining deposits declines. Research is being conducted to discover recycling methods for these wastes. (Weaver-Wisconsin)

ANTIPOLLUTION POLICIES, THEIR NATURE AND THEIR IMPACT ON CORPORATE PROFITS,
E. J. Stahr.
In: Economics of Pollution, New York University Press, New York, New York, p 81-136, 1971. 2 tab.

Descriptors: Economics, *Economic impact, *Environment, *Costs, Standards, Economic efficiency, *Pollution taxes (Charges), Industries, Cities, Effluents, Constraints, Water quality standards.
Identifiers: *Environmental pollution control, Antipollution charges, Economic incentives.

The problem of optimal environmental pollution control policy is generally discussed through consideration and criticism of public opinions and presentation of opinions following from economic principles. The nature of the pollution problem is shown to be one of 'ecosystem overload' due to increasing industrial production and world population, the introduction of 'exotic' materials into the environment, and the growing expectations of cleanliness, safety, and healthfulness by society. Antipollution policy should be based upon three principles: (1) elimination of polluting goods through technological change or social policy, (2) consideration of the economic efficiency of environmental programs, and (3) the establishment of environmental standards. The central conclusion suggests that economic incentives be introduced to pollution control programs. The impact of such policy on the domestic economy and international trade is generally discussed. The implications of the cost of environmental protection from pesticides is briefly reviewed. (Weaver-Wisconsin)

IDENTIFICATION AND ACHIEVEMENT OF ENVIRONMENTAL QUALITY LEVELS IN MANAGING THE USE OF NATURAL RESOURCES,
Iowa State Univ., Ames. Dept. of Economics.
J. F. Timmons.
Iowa Agriculture and Home Economics Experiment Station, Ames, Journal Paper No. J-7157, 1972. 29 p, 8 ref. OWRR B-015-IA (3)

Descriptors: *Water quality standards, *Management, *Cost transfer, Water policy, Decision making, Diseconomies of scale, Water reuse, Cost analysis, Methodology, Cost comparisons, Linear programming, Natural resources, Model studies, Cost allocations, Institutions.
Identifiers: *Environmental quality, *Least-cost analysis, *Next-use approach, Irreversible use.

Procedures for the identification, measurement, analysis, and achievement of environmental quality levels through natural resource management in the context of ecological, technological, and economic interrelationships are suggested. The next-use approach to the establishment of environmental quality levels given other social objectives was found preferable to the irreversibility approach. The next-use approach provided greater flexibility in the formulation of policy tailored for specific situations. Application of this approach is illustrated by two case studies in which least-cost estimates of achieving successively higher quality standards were obtained using linear programming. First-use effects on quality and next-use quality requirements were compared to derive the cost of alternative methods of raising the quality standards. Choice among these alternatives involves identifying the least-cost alternative given the provision of goods and services demanded by society. In addition, issues and possibilities involved with the achievement of a particular quality level in the context of various interrelated technological, economic and institutional considerations are briefly discusses. (Weaver-Wisconsin)
W73-12696

NOTE ON CHARGES AND BRIBES IN THE LONG RUN WITHIN WATERSHEDS,
Wyoming Univ., Laramie. Coll. of Commerce and Industry.
L. C. Maxwell.
Water Resources Research, Vol 8, No 5, p 1344-1346, 1972. 1 fig, 4 ref.

Descriptors: *Pollution abatement, *Pollution taxes (Charges), *Graphical analysis, Industries, Industrial wastes, Watersheds, Productivity, Economic efficiency, Economies of scale.
Identifiers: *Waste emission control, Long-run equilibrium.

How the impact of charges and bribes on long run levels of waste discharge and firm output for industries which are located in different watersheds and are characterized by increasing or decreasing costs was investigated. Kneese and Bower (1968) have demonstrated that the long run effect of charges and bribes was a symmetric reduction of waste emissions. The conclusion is that the impact of such charges and bribes is indeterminate. Based on the usual Marshallian conditions for long run equilibrium of firms and industries with the simplifying assumption that waste emission can be reduced only if the output of the firm is reduced, charges on waste emissions from a decreasing cost industry result in a decline in the production of both the representative firm and the industry; this impact is less severe in the case of a constant cost industry. The impact of such charges or bribes within any one watershed is indeterminate due to changes in emission which might occur in low damage watersheds, possible external resource price changes or insufficient a priori knowledge, as in the case in which abatement equipment is employed. (Weaver-Wisconsin)

A STUDY OF THE ECONOMIC IMPACT ON THE STEEL INDUSTRY OF THE COSTS OF MEETING FEDERAL AIR AND WATER POLLUTION ABATEMENT REQUIREMENTS. PART I - EXECUTIVE SUMMARY.

Available from the National Technical Information Service as PB-211 917, $3.00 in paper copy, $1.45 in microfiche. Council on Environmental Quality, Washington, D.C., July 1972. 16 p.

Descriptors: Costs, *Pollution abatement, *Cost analysis, *Economic impact, Financial feasibility, Air pollution, Water pollution control, Water quality standards, Industrial wastes, Pollution taxes (Charges).
Identifiers: *Steel industry, Capital expenditures, Foreign competition.

This volume summarizes findings and conclusions presented in Part II - The Structure of the Steel Industry and Part III - The Economic Impact of Pollution Abatement. The industry's output is highly concentrated among a small number of companies. Although demand for steel is highly sensitive to changes in the level of economic activity, steel prices have remained rigid in an upward direction. Lagging demand and increasing foreign competition have encouraged a breakdown in price leadership and increasing price shading. Stagnating demand resulted in falling profits which were stabilized in 1971 through price increases, improved productivity and management belt tightening. Voluntary restraint arrangements with foreign competitors have limited the increase of most types of steel imports. The potential impact of pollution abatement costs on the industry is dependent on many interacting and uncertain factors. However, subject to possible accelerated capital expenditures to replace plant and equipment which cannot be economically cleaned up, financing pollution abatement capital expenditures should be possible if the industry's profit performance parallels that projected in this study. (Weaver-Wisconsin)
W73-12707

IMPACT OF COSTS ASSOCIATED WITH NEW ENVIRONMENTAL STANDARDS UPON THE PETROLEUM REFINING INDUSTRY. PART I. THE IMPACT OF ENVIRONMENTAL CONTROL COSTS.
Sobotka (Stephen) and Co., New York.

Available from the National Technical Information Service as PB 207 199, $3.00 in paper copy, $1.45 in microfiche. Council on Environmental Quality, Washington, D.C. 59 p, November 1971. 2 tab., 9 exhibits.

Descriptors: *Pollution abatement, *Economic impact, *Oil industry, Costs, *Cost analysis, Cost trends, Financial feasibility, Capital costs, Construction costs, Equipment, Unemployment, Pricing, Effluents, Air pollution, Water quality standards, Industrial wastes, Pollution taxes (Charges).
Identifiers: *Refineries.

Analysis of cost and price effects of environmental pollution control bases upon cost data furnished by the Environmental Protection Agency leads to the following conclusions: Oil product price increases of about 8 cents per barrel resulting from installation and operation of new equipment and most importantly from substitution of low for high sulphur liquid refinery fuel. New control equipment will cost the industry $113 million. New control equipment installed in existing refineries has a higher cost per barrel of capacity than equipment installed during new refinery construction. Due to increasing demand, the absence of substitute products, and foreign competition, as well as a small price elasticity for most of the industry's products, the cost of control equipment will be substantially recovered through increased product prices. Refineries will be affected depending on their current effluent control facilities, size, and oil refining processes. Refineries below 25,000 barrels per day capacity may be unable to finance control facilities due to large control costs relative to their going concern value. These refineries account for less than 1% of industry capacity and employ less than 1,000 people. (Weaver-Wisconsin)
W73-12708

A DESCRIPTIVE ANALYSIS OF THE BAKERY PRODUCTS INDUSTRY DETAILING INDUSTRY TRENDS AND CHARACTERISTICS RELEVANT TO ECONOMIC IMPACT ANALYSIS OF ENVIRONMENTAL STANDARDS. PART II.
Ernst and Ernst, Washington, D.C.

Available from the National Technical Information Service as PB-207 170, $3.00 in paper copy, $1.45 in microfiche. Council on Environmental Quality, Washington, D.C. December 1971. 18 p, 3 fig., 4 tab.

Descriptors: *Economic impact, *Cost analysis, *Pollution abatement, Marketing, Industrial plants, Cost trends, Competition, Demand, Water quality standards, *Pollution taxes (Charges), Industrial wastes.
Identifiers: *Bakery industry, Industry trends, Industrial organization.

The structure, characteristics and trends of the bakery industry relevant to the economic analysis of the impact of pollution abatement costs are described. The market for bakery products and, thus, location of bakeries is a strict function of population and is subject to only insignificant variations due to regional preferences. Thus, cost increases associated with pollution abatement will be spread uniformly over regions, given uniform cost increases across all regions. The demand for bakery products has been highly inelastic. Despite a growing trend toward concentration in the bakery industry, there remain a large number of firms whose competitiveness has resulted in low profit margins. In addition, low-technology plants do not typically operate at a cost disadvantage. Thus, cost increase due to pollution abatement will have an unbiased impact on plants of various sizes. Government influence on supply of bakery products is minimal. There exists sufficient overcapacity to correct for possible losses in supply due to plants leaving the industry. (See also W73-12710) (Weaver-Wisconsin)
W73-12709

A STUDY OF THE IMPACT OF POLLUTION STANDARDS AND CHARGES ON THE BAKERY INDUSTRY. PART III.
Ernst and Ernst, Washington D.C.

Available from the National Technical Information Service as PB-207 171, $3.75, in paper copy, $1.45 in microfiche. Council on Environmental Quality, Washington, D.C. December 1971. 36 p, 3 tab, 2 append.

Descriptors: *Pollution abatement, *Economic impact, *Cost analysis, Industrial water, Industrial production, Cost trends, Financial feasibility, Water quality standards, *Pollution taxes (Charges), Industrial wastes.
Identifiers: *Bakery industry, Profit trends.

The preliminary findings of Part II of this study are amplified. The most relevant segmentation of the bakery industry is into (1) the bread, cake, and related products industry and (2) the biscuit and cracker industry. Within these two segments plants should be classified by size and amount of waste water discharged. Current trends in return on investment, employment, and concentration are expected to be unaffected by the small increases in cost due to pollution abatement activities. Using a cost model for pollution control in the bakery industry supplied by the Environmental Protection Agency, the probable impact of pollution control costs was found to be very insignificant. Annual abatement costs expected in the most expensive year (1976) were estimated by EPA to be $4.84 million. According to U.S. Department of Commerce data industry sales in 1976 are estimated as $9 billion. Thus, pollution abatement would raise costs .054 cents per dollar of sales, given current price trends. (See also W73-12709) (Weaver-Wisconsin)

MATHEMATICAL MODELING FOR ENVIRONMENTAL POLLUTION CONTROL,
Clemson Univ., S.C.
B. C. Dysart, III.
Seminar presented to: Southeast Water Laboratory, Environmental Protection Agency, Athens, Georgia, p 1-10, March 1972. 10 p, 1 fig. OWRR-B-017-SC (7).

Descriptors: *Water pollution control, *Environment, *Mathematical models, *Optimization, Value, Efficiency.
Identifiers: Accuracy.

There seems to be considerable hesitancy and reluctance on the part of many people to use optimization, for several reasons. Also, there are many who utilize it when it is a grossly inappropriate choice of tool for the problem at hand. These two groups do not average out for the benefit of pollution control. Some of the reasons people claim for their reluctance to use the technique are discussed. They include: (1) Instream transfer functions and process models are not accurate enough to use with reliability--optimization techniques cannot be trusted in this sort of problem solving; (2) the problem or system is too complex to model; (3) since the chances of implementing an optimal policy are slim, why bother to find one; (4) the use of optimization results in too much dependence upon economics and not enough consideration for the pragmatic aspects of how to deal with the problem; and (5) common optimization techniques are not adequate when dealing with large systems with great precision and consideration of minute details. Optimization can be advantageous as tools for guiding planners in water resources development, but professionals must decide realistically just what they want from mathematical modeling in general. (Bell-Cornell)

EVALUATION OF HERBICIDES FOR SUBMERGED WEEDS IN CHAMBAL AND BHAKRA-NANGAL CANAL SYSTEMS,
Indian Grassland and Fodder Research Inst., Jhansi. Div. of Weed Ecology Control.
T. R. Dutta, J. Prasad, and R. P. Singh.
Indian J Agric Sci. Vol 42, No 1, p 70-75. 1972.
Identifiers: *Aquatic weed control, Berseem, Canals, Ceratophyllum-Demersum, Chara-Vulgaris, Chlorothiamid, Coriander, Diuron, Endothal, Esters, *Herbicides, Hydrilla-Verticillata, *India, Linseed, Mustard, Najas-Minor, Potamogeton-Crispus, Potamogeton-Nodosus, Potamogeton-Pectinatus, Potamogeton-Perfoliatus, Rice, Vallisneria-Spiralis, Weeds, Wheat, Xylene.

Chlorothiamid, endothal (dipotassium and alkylamine), 2.4-D butoxyethanol ester, diuron and xylene were screened in situ on 25-m lengths of channels heavily infested with weeds at Kota and Jyotisar. The discharge capacity of these channels were seriously hampered by growth of Potamogeton perfoliatus L., P. pectinatus L., P. nodosus Poir., P. crispus L., Chara vulgaris Vals, Najas minor Rend., Hydrilla verticillata (L. f.) Royle, Ceratophyllum demersum L. and Vallisneria spiralis L. The experiments were conducted in both slow-flowing and stationary channels. Chlorothiamid, endothal and 2,4-D completely killed all the submerged weeds. The herbicides were more effective in stagnant than in flowing water. The treated water was found safe for linseed, mustard, gram, berseem, coriander, wheat and rice, which are the common crops of these regions. The herbicide-treated water was non-toxic for mammalian consumption.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF PESTICIDES IN WATER--A REPORT TO THE STATES.
Environmental Protection Agency, Washington, D.C.

Available from the National Technical Information Service as PB-222 320, $5.75 in paper copy, $1.45 in microfiche. (1972). 85 p, 2 tab, 52 ref, append.

Descriptors: *Pesticides, *Water pollution effects, *Water pollution control, *Federal Water Pollution Control Act, State governments, Environmental effects, Economic impact, Social aspects, Pollution abatement, Watershed management, Water pollution sources, Reviews, Evaluation.

Current knowledge is presented of the effects on health and welfare of the presence of pesticides in water. This document is to serve as a guide to the States in carrying out the Federal Water Pollution Control Act. Some of the more important considerations are: the nature of the environmental effect of the presence of pesticides in water (e.g., long or short term, temporary or permanent, localized or widespread, etc.); the economic and social impact of the control measure, including both impact associated with restricting use of pesticides, and the impact of the environmental damage to be alleviated; the practicality and enforceability of the control measure, including the availability of techniques and instrumentation for determining whether particular standards are being met; and the availability of other control measures for meeting the objectives, and the relationship to and consistency of the control measure with policy and action under other programs. CORROSION BY THE SULPHATE-REDUCING BACTERIA,
University of Manchester Inst. of Science and Technology (England). Dept. of Chemical Engineering.
D. A. King, and J. D. A. Miller.
Nature, Vol 233, No 5320, p 491-492, October 15, 1971. 2 fig, 1 tab, 13 ref.

Descriptors: *Corrosion, Cathodic protection, Chemical reactions, *Sulfer bacteria, Anaerobic bacteria.
Identifiers: *Cathodic depolarization, Anodic reaction, *Corrosion cell, Oxygen-free conditions.

There are several explanations for the aggravation of corrosion of iron and steel in oxygen-free conditions by sulfate-reducing bacteria. These are (a) stimulation of the cathodic part of the corrosion cell by the removal and utilization of the polarizing hydrogen by the bacteria, (b) stimulation of the cathodic reaction by solid ferrous sulphides formed by the reaction of ferrous ions with sulphide ions produced by bacteria, (c) stimulation of the anodic reaction, metal dissolution, by bacterially produced sulphide, (d) local acid cell formation and (e) formation of iron phosphide by the reaction of the metal with bacterially reduced phosphates. A new theory of corrosion by the sulphate-reducing bacteria is proposed such that the cathodic reaction, hydrogren evolution, occurs on the ferrous sulphide produced by the reaction of ferrous ion with bacterially produced sulphide ion. The ferrous sulphide activity is diminished with time, but is restored by removal of the atomic hydrogen by bacterial hydrogenase activity. (Campbell-NWWA)

ENCOURAGE APPLIED RESEARCH AND PUBLISH THE FINDINGS,
Minnesota Mining and Mfg. Co., St. Paul.
T. T. Ling.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 92, No SA4, p 1-5, August 1966.

Descriptors: *Sanitary engineering, Waste water, Technology, *Engineering education, On-site investigations, Projects.
Identifiers: *Applied research, Federal Water Quality Act.

A number of engineers have indicated that most sanitary engineering research papers now being published are too 'academic'; findings cannot be directly applied to solve field engineering problems. In order to bridge this gap and provide a more balanced program that serves the academician as well as the field engineer, the scope of research must be enlarge to include more applied research. Due to the Federal Water Quality Act, information that can be used to solve various sanitary engineering problems is needed more than ever before; results obtained from applied research through the study of existing installations represent one of the best sources to fill this demand. Feasible means, such as the presentation of papers at national conferences, reimbursed if possible, are needed to encourage engineers, consulting firms, municipalities and various control agencies to participate in research and publish their findings. ANNUAL LITERATURE REVIEW: ADMINISTRATION, SYSTEMS ANALYSIS,
Cornell Univ., Ithaca, N.Y. Dept. of Environmental Engineering.
D. P. Loucks.
Journal Water Pollution Control Federation, Annual Literature Review, Vol 45, No 6, p 1407-1414, June, 1973. 98 ref.

Descriptors: *Water pollution control, Waste water treatment, *Systems analysis, *Planning, *Decision making, *Management, Water quality, Simulation analysis, Optimization, Dynamic programming, Linear programming, Bibliographies, *Reviews.

The 1972 literature on the development and application of systems analysis techniques for defining and evaluating alternative water pollution control policies can be divided into state-of-the-art reviews, methodological studies, and applications of mathematical models to river, lake, or estuarine water quality control problems, to the analysis and design of sewer systems and waste water treatment facilities, and to particular problems in thermal pollution and industrial and agricultural effluent control. Forty-four such documents (books, articles, and reports) pertinent to the field of waste water treatment and water pollution control are summarized. The writings include a broad spectrum of mathematical modeling techniques, such as simulation analysis, linear and dynamic programming, and other optimization methods, to estimate feasible and often least-cost design and management alternatives for water quality planning. Journal Water Pollution Control Federation, Vol 45, No 5, p 787-808, May 1973. 1 tab, 4 ref.

Descriptors: *Waste water treatment, *Administration, *Personnel, *Training, Operations, Classification, Education, Regulation, Water quality control, Water pollution control.
Identifiers: *Certification programs, Examination, Certification renewals, Certification criteria.

A study was conducted, supported by an EPA grant, of state programs for certification of operations personnel in wastewater facilities. Six states were visited and the others polled for facts and opinions on key issues. The project report included the findings and conclusions of the study and recommended actions for federal and state agencies. A 'State Certification Program Guide' is presented that attempts to describe the elements of an effective state program. The states are encouraged to coordinate their efforts, and particular attention is directed toward (a) adequate autonomy and budget, (b) separate certification from training, (c) broader coverage of personnel and facilities, (d) development of a sound classification system, (e) separate certification for industrial waste facilities, and (f) easier reciprocity among state programs. PROPOSED OIL POLLUTION REGULATIONS, (FINAL ENVIRONMENTAL STATEMENT).
Coast Guard, Washington, D.C. Marine Environmental Protection Div.

Available from NTIS, Springfield, Va. 22151 as EIS-AA-73-0279-F - Price $3.00 printed copy; $1.45 microfiche. February 1973. 22 p.

Descriptors: *Coast Guard regulations, *Oil spills, *Oil industry, *Water pollution control, *Navigable waters, Navigation, Legal aspects, Transportation, Ships, Boats, Barges, Harbors, Inland waterways, Environmental control.
Identifiers: Transfer of oil, Environmental Impact Statements.

The U.S. Coast Guard, acting under the authority of the Federal Water Pollution Control Act, presents regulations governing the design, construction, and operation of vessels operating in the navigable waters and contiguous zone of the United States, and governing the design, construction, and operation of onshore and offshore facilities engaged in the transfer of oil in bulk (more than 250 barrels) to and from vessels. The purpose of these regulations is to reduce the probability of an accidental discharge of oil or oily wastes to or from vessels, or as a result of certain vessel accidents of limited energy. Descriptors: *Systems analysis, *Cities, *Regional analysis, *Water distribution (Applied), *Sewers, *Planning, Land use, Demand, Network design, Model studies, Computer models, Cost analysis, Census, Human population, Water demand, *Oklahoma.

The objective was to provide the average planning group with a usable tool that would impart a systematic procedure for analyzing the water and sewerage networks of a regional metropolitan area. The framework derived for conducting this study was accomplished by the construction of six procedures which use three computer models: the inventory and data projection procedure which provides the input; the population model and procedure which generates the desirable alternatives in terms of people and their socio-economic characteristics; the land use procedure which allocates the output of the population model to an areal scheme; the demand model and procedure which produces the water demand and sewage output for the given areal scheme; the network model and procedure which optimizes on a least cost basis, while maximizing utilization of resources, the networks of water and sewerage to fulfill the alternatives available, and finally the plan procedures for the development of a continuing and comprehensive plan. The steps between each procedure have built-in planner intervention points, where the using group may 'game' new alternatives based on the results and data acquired from the previous procedure. The model was developed using data from the association of Central Oklahoma Governments.

CRITICAL REVIEW OF CURRENTLY AVAILABLE WATER QUALITY MODELS,
Hydrocomp, Inc., Palo Alto, Calif.
P. S. Lombardo.
Available from the National Technical Information Service as PB-222 265, $4.85 in paper copy, $1.45 in microfiche. Report, July 1973. 101 p., 5 fig., 5 tab, 62 ref, append. OWRR X-124 (No 3751) (1). OWRR 14-31-0001-3751.

Descriptors: *Water quality, *Model studies, *Reviews, Research priorities, *Simulation analysis, Management, Systems analysis, Input-output analysis, Data collections.

The state of the art of water quality modeling is reviewed and the six most comprehensive of the available models for simulating most water quality indices, including temperature, dissolved oxygen, BOD, nutrients, algae and zooplankton are evaluated. Models simulating only the DO-BOD relationship were considered to be inadequate for water quality management purposes and were not reviewed. Research needs for water quality model refinement are discussed. The importance of obtaining data adequate in quantity and detail for testing of models is stressed. Model application and analysis of model output are discussed. The Chen and Orlob model is felt to be the best present model for lake and estuarine analysis, and the Lombardo and Franz model appears to be the best available model for stream analysis.

MATHEMATICAL MODELS IN ECOLOGY, PROCEEDINGS OF THE 12TH SYMPOSIUM.
Grange-over-Sands, Lancashire, England, March 23-26, 1971. Blackwell Scientific Publications: Oxford, England; (Dist. in U.S.A. by F. A. Davis Co.). 1972. J. N. R. Jeffers, editor, 398 p, Illus. Map. Pr $21.00.
Identifiers: Books, *Ecology, *Mathematical models, Proceedings, Symposium, Computer models.

The papers presented represent the current state of the use of mathematical models in ecology and related sciences. The first group of papers cover the following topics: the challenge of mathematics to the ecologists; philosophical aspects of mathematical modelling in empirical science with special reference to ecology; developments in the Leslie matrix model; models and analysis of descriptive vegetation data; and theoretical models for large-scale vegetation survey. The next several papers cover the following topics: organization and management of an integrated ecological research program; building and testing ecosystem models; population models as a basis for pest control; an introduction to the analogue computer; parameter sensitivity and interdependence in hydrological models; and the use of computer simulation in conservation management. Papers are included on the following specific subjects: the simulation language as an aid to ecological modelling; stochastic model fitting by evolutionary operation; a field experiment, a small computer and model simulation; data management; and a discussion of the application of mathematical models to the assessment of the changes likely from the construction of an esturarine barrage. A section is included presenting a summary and assessment of the symposium from the point of view of a research director, an agricultural research scientist, a statistician and an ecologist. Numerous mathematical formulas are employed throughout, and each paper ends with a list of related references.--Copyright 1973, Biological Abstracts, Inc.

THE DEVELOPMENT OF A REGIONAL SYSTEMS ORIENTED WATER MANAGEMENT MODEL: A TOOL FOR POLICY ANALYSIS,
Case Western Reserve Univ., Cleveland, Ohio. Systems Research Center.
J. M. Richardson, Jr.
Technical Report, SRC Tech. Memo No 45, Rockefeller Paper-JMR-73-4, June 1, 1973. 33 p, 12 fig, 14 ref, 3 append.

Descriptors: *Water management (Applied), *Regional analysis, *Simulation analysis, *Planning, *Decision making, Water quality, *Political aspects, Water, Ecosystems, Phosphorous, Pollution abatement, Waste treatment, Governments, Computerprograms, Economics, Mathematical models, Systems analysis.

With the complexity of large social-technological-biological systems, the use of systems modeling and computer simulation techniques are believed to be necessary and highly potential for planning in the comprehensive field of water management. In order for a model to be useful to decision makers, it must meet two sets of potentially conflicting criteria: (a) Comprehensiveness and reliability; and (b) usability. Two submodels of a systems oriented regional water management model are discussed. The submodels, called PHIPAM (Phosphorus Interactive Policy Analysis Model) and IRRM (Institutional Regional Regulatory Model) are designed to simulate, respectively, an interactive decision stratum and the political aspects of local government planning and decision making in water management. They are specifically designed to strengthen the larger model of which they are a part in the problem areas of comprehensiveness and utility. PHIPAM and IRRM represent concrete attempts to bridge the gap between scientific validity and utility. With further development, it is hoped that they can contribute to the more effective utilization of systems models for policy analysis in the area of water management and elsewhere. (Bell-Cornell)

J. K. Garner, and C. S. Shih.
Available from the National Technical Information Service as PB-221 182, $3.00 in paper copy, $1.45 in microfiche. Technical Report No 49, June 1973, 152 p, 41 fig, 12 tab, 135 ref. OWRR A-017-TEX (2). 14-31-0001-3844.

Descriptors: *Water resources development, *Planning, Reliability, *Texas, Cities, *Water quality control, Regional analysis.
Identifiers: San Antonio (Tex), San Antonio River Basin (Tex), Cibolo Creek (Tex), Balcones Escarpment (Tex), Edwards Plateau (Tex), Sensitivity.

The region incompassed by the San Antonio River Basin is described. Included is a brief summary of the regional economy, demography, and geographical characteristics. Additionally, quantitative information including the inventory and planning control for both surface and groundwater resource management of the San Antonio area is presented. Emphasis has been placed upon the identification of the probabilistic nature of regional water quality management. The methods and techniques developed for handling massive data and the reliability analysis for regional water quality control are also presented. (Runkles-Texas)

AN EVALUATION OF BALTIMORE HARBOR LAND USE POTENTIALS,
Regional Planning Council, Baltimore, Md.
M. L. Collin.
Available from the National Technical Information Service as BTL-RPC-BHLNVR-2-73. Prepared for Maryland Environmental Service, February 1973. 239 p, 34 fig, 8 tab, 4 append, 110 ref.

Descriptors: *Harbors, *Land use, Water quality, Environmental effects, *Urban renewal, Navigation, Aesthetics, Social aspects, Recreation, *Maryland, City planning.
Identifiers: *Baltimore Harbor, Optimal development, Compatible development, Ann Arundel County, Maryland, Baltimore City (Md), Maryland Port Authority, Charles Center - Inner Harbor Management, Army Corps of Engineers.

Baltimore Harbor has been an important commercial center for over 200 years. A concerted effort has been made by local planners, citizens, and governmental agencies to not only sustain the economic productivity of the Harbor but also to make the Harbor a more attractive and healthy setting for a wide range of activities and to help preserve various ecological processes. Land use on the shoreline of the Harbor is discussed. This includes discussions of the history of the Harbor area, existing land use patterns, effects of existing and uses on the water quality of the Harbor, and socio-economic trends in Harbor areas. Concepts of optimal harbor development and land use patterns are also discussed including suggested patterns for specific areas. Some features of optimal development include maximum public access to the water, compatible development of residential, recreational, and commercial land uses, redevelopment of deteriorating commercial and industrial areas, and a new lateral circulation pattern. HEURISTIC RANKING AND PRIORITIZING UNDER SUBJECTIVE CONDUCTIONS,
Bureau of Reclamation, Denver, Colo.
B. W. Paul.
Paper, ORSA, TIMS, AIEE Jt Natl Meet, Atlantic City, NJ, Nov 1972. 24 p.

Descriptors: *Project planning, *Decision making, *Priorities, Flood control, Economic justification, Economics, Project feasibility, Costs, Budgeting, Finance, Water quality, Recreation, Electric power production, Irrigation, Evaluation, Planning.
Identifiers: Environmental quality, Heuristic methods, Fish and wildlife, Criteria.

Annually the Bureau of Reclamation must decide which of some 150 potential planning projects should be identified for funding. A ranking or priority system is discussed by which the projects of different regions can be consistently evaluated and compared. Two side benefits are desired of the system: One is an audit trail of the decision process so that during Congressional hearings the reasons for choosing one project over another can be given; the other is a means of introducing and using new multiobjective planning (MOP) criteria. New Water Resource Council MOP standards require evaluation on a 4-account system; National Economic Development (NED), Regional Development (RD), Environmental Quality (EQ), and Quality of Life (QL). Results and analysis of system use are discussed. The system is shown to be a viable tool in analyzing projects for timely development. (USBR)

NEW TECHNIQUES FOR PARTICIPATIVE PLANNING IN WATER RESOURCES,
Colorado Univ., Boulder.
J. E. Flack.
Proc Int Symp Uncertainties Hydrol Water Resour Syst, Vol II, p 730-737, Univ Ariz, Tucson, Dec 1972. 11 ref.

Descriptors: *Planning, *Water resources, Economic efficiency, Public benefits, *Analytical techniques, Project planning, Economic justification, Statistical analysis, Environmental effects, *Decision making, Methodology.
Identifiers: Computer graphics, Alternatives, Public opinion, Policies, Statistical analysis.

A method is described that will permit selected participants in the decision-making process to exercise judgement, as contrasted with approval or disapproval, during the planning process. Major steps in this procedure are: (1) important attributes of technically complex issues surrounding water resources development are identified and defined in terms meaningful to laymen; (2) alternative water resource plans are evaluated; (3) through analysis of participants' evaluation judgments, alternative physical plans are developed; and (4) the final plan is recommended by a representative panel of citizens, agency officials, special-interest groups, and the engineer-planner. Analytical aids are provided to ensure that the recommendations of panel members are consistent with their best judgment as well as the judgment of the broader range of participants, and the technical and financial constraints of the system. Advantages of this process are that many interests become involved in the planning, several alternatives are developed, and decision making is structured to reduce disagreement and increase certainity of plan acceptance. (USBR)

MEASURING AND DEVELOPING METHODS OF ATTITUDE AND MOTIVATIONAL CHANGE IN IMPLEMENTING THE BIG BLUE RIVER BASIN WATER PLAN,
Doane Coll., Crete, Nebr.
E. J. McPartland.
Available from the National Technical Information Service as PB-222 274, $5.50 in paper copy, $1.45 in microfiche. 1973. 200 p, 54 tab, 45 ref, 7 append. OWRR-C-3160 (No 3696) (1). 14-31-0001-3696.

Descriptors: *Attitudes, *Behavior, *Motivation, Social aspects, Land management, Pollution abatement, Water quality, Recreation, Irrigation, Flood control, *Nebraska.
Identifiers: *Net attitude change, *Gross attitude change, Demographic characteristics, Survey research, Public opinion, *Big Blue River Basin water plan.

A series of public opinion surveys was used to determine what demographic factors were most related to people's attitudes toward water resources use, to discover public attitudes toward various issues concerned with water resources use, and to test and compare methods of communicating knowledge about water resources problems. The results indicated that higher incomes, more years of formal education, younger age groups, and town residence were more as-

sociated with positive attitudes toward water resources use than other variables. A close relationship to farming was less favorably associated with positive attitudes toward water resources use than any other demographic factor. Attitudes were generally positive toward proper farming methods, small watershed development, pollution abatement, and to a lesser extent for recreational development. Farmers opposed government regulation of farming practices, the construction of large flood control reservoirs in their area, and were divided over the issue of metering irrigation water. Informational sources pervaded by personal contact and inducing personal involvement were more closely associated with significant short-term attitude change than more impersonal informational sources such as newspapers.

A STUDY OF SELECTED ASPECTS OF RURAL WATER SYSTEM DEVELOPMENT IN MISSISSIPPI,
Mississippi State Univ., State College. Social Science Research Center.
P. J. Ross, R. N. Friery, and J. H. Peterson, Jr.
Available from the National Technical Information Service as PB-222 275, $3.50 in paper copy, $1.45 in microfiche. Mississippi Water Resources Research Institute Report, 1973. 53 p, 7 fig, 20 tab, 13 ref, 3 append. OWRR A-068-MISS (1).

Descriptors: Social aspects, *Rural sociology, Water supply, *Mississippi, Water resources development, *Rural areas, *Community development, Social change, *Regional analysis, *Regional development.

The major aims were to study patterns of the development of rural water systems in Mississippi and to examine major variables associated with patterns of rural water system development. Major findings included: (1) wide range of differences between water systems in terms of size, expansion, and racial composition of associated members, (2) distinct patterns of rural water systems development in the state following regional lines, and (3) slight to moderate associations between socioeconomic and demographic variables and rural water system development, though the differences in rural water systems development were not consistently or substantially explained by socioeconomic and demographic variables indicating that rural water system development is dependent on the interaction of many types of variables. ECONOMIC AND RELATED IMPACTS OF RURAL WATER SYSTEMS IN MISSISSIPPI,
University of Southern Mississippi, Hattiesburg. Bureau of Business Research.
B. M. Landry, C. P. Cartee, and D. C. Williams, Jr.
Available from the National Technical Information Service as PB-222 276, $3.50 in paper copy, $1.45 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Report July 1973. 67p, 1 fig, 8 tab, 12 ref, 5 append. OWRR-A-060-MISS (1).

Descriptors: Water supply, *Rural areas, *Economic impact, *Mississippi, Social aspects, Water resources development, *Community development, *Rural sociology, *Social change, *Regional analysis.

Construction and operation of rural community water systems in Mississippi have resulted in economic and related impacts. This study identified the impacted variables and quantified and qualified them as possible. Variables isolated for study included direct expenditures for construction and on-going expenditures related to operations and maintenance, land values, new housing construction, and commercial and industrial activity. Other variables studied included the change in the number of households lacking a water supply, system effects on households who could not afford individual wells, changes in the use of water-using household appliances, household improvements, and changes in water use per connection. In addition to the economic impact of the direct and on-going expenditures for the systems, each of the above variables was found to be impacted to varying degrees by the presence of the water system in the community. These are quantified and qualified based on a statewide survey of all systems. (See also W73-12492)
W73-12493

THE EFFECT OF PRICE AND OTHER SELECTED VARIABLES ON WATER CONSUMPTION,
Mississippi Univ., University. Bureau of Business and Economic Research.
K. W. Hollman, and W. J. Primeaux, Jr.
Available from the National Technical Information Service as PB-222 264, $3.00 in paper copy, $1.45 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Report, July 1973. 23 p, 5 tab, 4 ref. OWRR-A-064-MISS (1).

Descriptors: *Pricing, *Water utilization, Economics, Water conservation, *Water allocation (Policy), *Mississippi, Optimum development plans, *Regression analysis, Water demand, *Community development.

The objective was to isolate the impact of selected variables on water consumption. It is important to identify the determinants of water consumption so that vital managerial decisions can be facilitated. Given the variables which affect water utilization, public officials can manipulate prices and policies to help conserve water and to allocate water supplies in the optimum manner. Data from 14 cities in north Mississippi were used in the analysis. A multiple regression model was used to determine the specific impact of the variables. The principal conclusion of the analysis was that consumers are relatively unresponsive to price differences within the price ranges displayed in the study. These results indicate that price can be used effectively as a revenue raising device but is probably ineffective as a rationing device within the current range of prices. The number of residents per household was the primary determinant of water consumption levels per household. Other factors also had a small but significant explanatory effect. In general, the results reveal that communities able to forecast correctly their future population growth will be in an advantageous position with respect to future demands on their water systems.

PROBLEMS OF ENVIRONMENTAL ECONOMICS.

Organization for Economic Co-operation and Development seminar June-August 1971, Paris, France, 1972. 278 p. 20 fig, 17 tab, 9 ref. Price $5.50.

Descriptors: *Environment, *Pollution abatement, *Economic efficiency, *Economics, Analytical techniques, Cost-benefit analysis, Input-output analysis, Econometrics, Cost allocation, Foreign trade, Indicators, Decision making.
Identifiers: *Environmental pollution, Policies.

This volume consists of papers written for the seminar on environmental economics organized by the 'Central Analysis and Economic Evaluation Unit' of the Organization for Economic Co-operation and Development. Three selected subjects were discussed: (1) problems and instruments of environmental cost allocation; (2) methods of analysis and environmental indicators; and (3) international problems. Introductory papers investigated possible conflict between economic growth and environmental protection. The subject of allocation of environmental costs was treated in discussions of the economic efficiency of alternative environmental policies as based upon a study of the economic principles for internalizing external economics. Determination of environmental indicators was the area of principal interest in the discussion of methods of analysis. Two lines of approach studies were the approach by sectors, including benefit-cost analysis, and the integrated approach by input-output analysis, materials balance and econometric models. International problems studied were connected with the impact of environmental policy on international trade and 'trans-frontier pollution.' (See also W73-12676 and W73-12686) (Weaver-Wisconsin)
W73-12675

ENVIRONMENTAL POLICY ISSUES: REAL AND FICTITIOUS,
University Coll. London (England). Dept of Political Economy.
W. Beckerman.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 19-38. 2 fig.

Descriptors: *Welfare (Economics), *Environment, *Gross National product, *Pollution abatement, Quality control, Values, Costs, Optimization, Economics, Economic efficiency, Decision making.
Identifiers: *Environmental pollution, Economic growth, Policies, Value judgements, Economic conflicts, Pollution control.

The main economic aspects of environmental policy are surveyed in order to differentiate those which are particularly important in formulating practical policies concerning the environment as well as those relevant to the work of an international economic organization. Two general economic aspects of environmental policy are discussed: (1) the relationship of economic growth or development and the quality of the environment, and (2) the optimum composition of national output taking into account the effects of different components of output on the environment. A conflict does not automatically arise between economic growth and environmental protection; in fact, economic growth with due regard for the environment could enable new technologies to be developed which might contribute to growth. More research should be done on social indicators and in defining the economic magnitudes indicative of welfare. To facilitate decision-making, studies should be made at the macro-economic level to analyze such problems as possible clashes between environmental goals and various national economic goals. The general need for further research into the choice of instruments for pursuing optimum environmental policies is discussed. (See also W73-12675) (Weaver-Wisconsin)
W73-12676

ANTI-POLLUTION POLICY AND COST ALLOCATION: THE ISSUES IN PRACTICE,
Padua Univ. (Italy).
G. Muraro.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 41-57. 1 fig, 9 ref.

Descriptors: *Economic efficiency, *Pollution abatement, *Cost allocation, Compensation, Pollution taxes (Charges), Economic feasibility, Control, Unit costs, Costs, Air pollution, Water pollution, Sewage, Methodology.

Identifiers: *Pollution control, *Policies, Externalities, Pareto optimality, Charges, Italy, Indirect control.

Most of the economic literature concerned with pollution advocates taxation of the polluter as a means for establishing Pareto optimality. A general discussion is presented which is intended to provoke further consideration of the practical features of various pollution abatement problems and to analyze how they hamper the optimal solution. Representative cases illustrate these problems as found in situations of consumer-to-consumer and industry-to-consumer externalities. The question of interim policy, presently under study in Italy, is reviewed. The Italian program accepts the principle of government support for polluters as an interim policy. Although polluters will eventually be expected to meet standards or pay an optimal pollution tax, interim policy would provide incentives for the adoption of pollution control measures. (See also W73-12675) (Weaver-Wisconsin)
W73-12677

NOTES ON INFORMATION AND ADMINISTRATIVE COSTS IN THE THEORY OF EXTERNALITIES,
Queen Mary Coll., London (England). Dept. of Economics.
A. Coddington.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 59-65. 5 fig.

Descriptors: *Pollution abatement, *Administrative costs, Cost allocation, Cost-benefit theory, Standards, Economic feasibility.
Identifiers: *Externalities, Cost internalization, Allocative efficiency, Information costs, Pollution control.

Although the simple theory of externalities suggests that misallocation of resources due to divergent marginal private and social costs may be corrected to some degree by internalizing this difference, this theory fails to consider the social costs associated with internalization. Two categories of such costs are presented: the costs of acquiring the information necessary to determine the allocative optimum, and the costs of administering the system of cost allocation. Only when these costs are considered can one deal with the questions of whether allocative correction is economically feasible or whether the simple theory leads to an optimal correction allocation for which the marginal costs need to be considered. Instruments for cost internalization include (1) charges, seen either as a unit tax on externality or as administered pricing of environmental inputs, (2) compensation, and (3) direct controls. (See also W73-12675) (Weaver-Wisconsin)
W73-12678

ENVIRONMENTAL QUALITY INDICATORS AND SOCIAL INDICATORS,
Commissariat General au Plan, Paris (France).
B. Cazes.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 77-82. 2 tab.

Descriptors: *Pollution abatement, *Indicators, *Cost-benefit analysis, Social values, Decision making, Benefits.
Identifiers: *Pollution control, *Environmental quality indicators, *Social indicators.

General expectations of social indicators are interpreted as including expression of results rather than costs and of more definitive results than economic concepts such as the GNP. A general discussion of ideal social indicators is presented and a system in which a social indicator should be viewed is suggested. This system includes four elements: (1) indication of continuous change with respect to the initial situation, (2) measurement of values attributed to benefits arising from each situation, (3) indication of cost involved in bringing about alternative situations envisaged, and (4) measurement of the net benefit for each alternative situation considered. The advantages of the type of social indicator suggested are discussed. Environmental quality indicators fit into the analytical scheme given for social indicators, which means that in addition to collecting physical indicators, the profits and costs of alternative policies which would change the situation indicators to a greater or lesser extent must also be considered. (See also W73-12675) (Weaver-Wisconsin)
W73-12679

PETER BOHM.
Handelshogskolan i Stockholm (Sweden).

In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 83-91.

Descriptors: *Pollution abatement, *Estimating, *Measurement, Indicators, Cost-benefit analysis, Pricing, Decision making, Benefits, Welfare (Economics), Jurisdiction.
Identifiers: *Pollution control, Social indicators, 'Willingness-to-pay'.

Environmental deterioration has been overlooked in the past because the value of such deterioration is difficult to determine. Many alternative measures of these environmental effects might be constructed; however, it is argued that such indicators are not a prerequisite for meaningful environmental policy and that they may, in fact, be misleading for policy decisions. Instead, it is suggested that what is needed is (1) a large set of physical (non-aggregated) indicators keeping track of crucial parts of the environment and (2) a code to translate changes in such data into comprehensible consequences for human life and well-being. In addition, there must be a process by which the benefits of pollution control can be compared with the costs. It is suggested that an approach to estimating the 'willingness-to-pay' of those who would benefit from a positive change in environmental quality is theoretically less objectionable and potentially practicable than alternative approaches such as opinion polls. The experimental use of the 'willingness-to-pay' approach is advocated both at the local level and as a possible solution for some multi-jurisdictional pollution cases. (See also W73-12675) (Weaver-Wisconsin)
W73-12680

THE SET UP OF THE STATISTICAL SYSTEM WITHIN WHICH THE DETERIORATION OF THE HUMAN ENVIRONMENT WILL BE ESTIMATED,
Centraal Bureau voor de Statistiek, The Hague (Netherlands).
R. Hueting.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 93-101.

Descriptors: *Statistical methods, *Pollution abatement, *Market value, *Welfare (Economics), Measurement, Indicators, Cost analysis, Estimated costs, Estimated benefits.
Identifiers: *Pollution control, Collective goods, Netherlands.

The utility attributed to an 'environmental good' to be recovered through environmental pollution control and the cost of its achievement are found to be the prerequisite for striking a balance between the increasing consumption of industrial goods and the resultant diminishing supply of collective environmental goods, such as clean water, air, and space. The attempt of the Netherlands Central Bureau of Statistics to estimate this information is reviewed under three general headings: (1) goals of the investigation of the deterioration of the environment, (2) starting points of the investigation, and (3) methods of estimation. Under the first heading it was found that costs environmental control and change in the state and trend of the environment should be estimated. With these results economic growth of the past should be recalculated, and a well-rounded picture should be presented to policy makers. The investigation should begin first with an estimation of costs and second with an appraisal of the urgency of preferences for environmental control. Different methods of estimation are recommended for each environmental component (air, water, and soil) depending on techniques of environmental control employed in each case. (See also W73-12675) (Weaver-Wisconsin)
W73-12681

SOME LIMITATIONS OF BENEFIT-COST ANALYSIS IN RESPECT OF PROGRAMMES WITH ENVIRONMENTAL CONSEQUENCES,
London Univ., (England). Dept. of Economics.
A. Coddington, H. Opschoor, and D. Pearce.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 119-123. 1 fig.

Descriptors: *Pollution abatement, *Cost-benefit analysis, Decision making, Welfare (Economics), Input-output analysis.
Identifiers: *Pollution control, Revealed preferences, Externalities.

Benefit-cost analysis is an application of neo-classical welfare economics which allows social evaluations which are sensitive to individual preferences. However, the distinction between the welfare of and the preferences of an individual is introduced. This distinction must be noticed when revealed preferences are not based on an awareness of the results of choices and on the ability to link these states causally with consumption behavior or externalities which produce them. Although benefit-cost analysis should have a role in the formulation of environmental policy (1) the limited significance of the information it provides should be fully realized, and (2) it should be secondary to substantive investigation of environmental-economic interactions in physical terms. W73-12682

OUTLINE OF A MACRO-ECONOMIC ANALYSIS OF ENVIRONMENTAL POLLUTION: A MULTI-SECTORAL APPROACH,
Oslo Univ. (Norway). Inst. of Economics.
Steinar O. Strom.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 125-141. 2 tab, 1 ppend.

Descriptors: *Input-output analysis, *Mathematical models, Pollution abatement, Pollution taxes (Charges), Projections, Long-term planning, Decision making.
Identifiers: Residuals, Macro-economic analysis, Norway, Materials balance.

A study carried out in cooperation with the Planning Division of the Norwegian Department of Finance is briefly described. The goal was an empirical analysis of environmental spillovers from economic activities found through long-run projection analyses based upon a macro-economic framework. The conceptual framework of the study views economis activities as affecting the natural environment through (1) occupation of space (2) extraction of raw materials, and (3) return of residuals. Residuals are not identical to pollutants because the natural environment is considered to have an assimilative capacity for residuals. The macro-economic empirical study follows from a dynamic, input-output model which

includes the generation of residuals. Data employed by the model were gathered using an extended rational accounting scheme, which is described. Generation of residuals is included in the model by giving goods and services positive values, and primary and secondary wastes negative values. The behavior of the model is studies as a function of the levels of charges levied on wastes. (See also W73-12675) (Weaver-Wisconsin)

EVALUATION OF THE ECONOMIC EFFECTS OF ANTI-POLLUTION PUBLIC POLICY,
M. Lo Cascio.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 143-179. 3 fig, 1 tab.

Descriptors: *Pollution abatement, *Mathematical models, *Economic impact, *Econometrics, Economic prediction, Institutional constraints, Evaluation, Legislation, Welfare (Economics), Resource allocation, Costs, Prices, Productivity.
Identifiers: *Pollution control, Italy, Macro-economic analysis.

A methodology is discussed for analysing the effect on the economic system of direct State-intervention to control the main forms of pollution. The methodology presented is aimed at an economic analysis which might provide a specific solution to the problem of compatiability between one or more explicit objects of the function of social welfare (for example, balanced distribution of incomes) and the implicit objective of its function (for instance, a certain philosophy on development). In order to accomplish this an econometric model is presented which provides a basis for studying the sequence of effects induced by anti-pollution measures. These include: (1) the direct effects on costs and prices, (2) the effects on the demand for equipment, and (3) the effects on the structure of final demand, on wages and on output levels. A solution is achieved through simultaneously assessing the direct and indirect effects of pollution on costs and prices in 54 economic sectors over the time period up to 1975. (See also W73-12675) (Weaver-Wisconsin)

ECONOMIC EFFECTS OF TECHNOLOGY CHANGES IN RELATION TO THE ENVIRONMENT,
Bari Univ. (Italy). Instituto di Merceologia.
G. Nebbia.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 181-197. 3 tab.

Descriptors: *Input-output analysis, *Pollution abatement, Economics, Welfare (Economics), Technology, Pollutants, Waste assimilative capacity, Wastes.
Identifiers: Residuals, Italy, Technological change, Macro-economic analysis.

One of the objectives of the environmental activity of the Organizations for Economic Co-operation and Development, is to analyze and evaluate the economic effects of environmental problems consisered as an integrated system related to economic and social development. Before such an approach can be made, biological and ecological statistics must be gathered; these should include quantities of resources entering into the production and consumption processes as well as the volume, chemical composition, and destination of related wastes. The specific nature and characteristics of these data are discussed. Given these statistics it is recommended that analysis form only a part of broader research directed towards the investigation of how technological change may optimize the production of commodities at a greater level of social and environmental welfare. Work being done towards this purpose at Bari University, Italy, is describes as the construction of circuits which trace the input and output flows of resources as well as the types of wastes associated with each output and the distribution of each of those wastes in the environment. (See also W73-12675) (Weaver-Wisconsin)
W73-12685

THE ROLE OF UNIFORM STANDARDS IN INTERNATIONAL ENVIRONMENTAL MANAGEMENT.
Maryland Univ., College Park. Coll. of Business and Public Administration.
J. H. Cumberland.
In: Problems of Environmental Economics, Organization for Economic Co-operation and Development, Paris, 1972, p 239-253. 4 fig.

Descriptors: *Cost allocation, *Standards, *Pollution abatement, Management, Wastes, Pollutants, Industrial production, Welfare (Economics).
Identifiers: *International uniform standards, *Pollution control, Externalities, Pareto optimality.

The question of whether it is desirable to introduce a system of uniform international environmental standards is analyzed in the context of the differences in socio-economic structures, competitive strength, and natural resources between countries. It is argued that trade problems and purely economic criteria should not be allowed to obscure the need for compulsory standards when human health is threatened. Uniform standards are indispensable for ensuring biological safety and maintaining the quality of common property resources such as seas, lakes, rivers, and air. However, differences between countries are shown to make uniform standards ineffective with respect to cost allocation problems. Alternative economic measures, such as effluent charges and subsidies, would be superior to uniform product standards imposed upon heterogeneous economics. (See also W73-12675) (Weaver-Wisconsin)
W73-12686

EVALUATION OF ENVIRONMENTAL INTANGIBLES,
Department of Indian Affairs and Northern Development, Ottawa (Ontario). National and Historic Parks Branch.
N. H. Coober, and A. K. Biswas.
Genera Press, Bronxville, New York, 1973. 77 p. 14 fig, 320 ref.

Descriptors: *Intangible benefits, *Cost-benefit analysis, *Recreation, *Analytical techniques, Measurement, Aesthetics, Mathematical studies, Values, Evaluation.

Financial justification of environmental programs is vital to their implementation by either the private or public sectors. Such justification requires measuring intangible benefits and costs associated with various programs. Those techniques of measurement accepted in the past or currently proposed in the literature are synthesized, organized, and criticized. The report has three sections: (1) a historical and economic background of evaluation techniques and their relevance to benefit cost analysis, (2) a classification and discussion of techniques for economic evaluation of environmental intangibles and (3) a classification and critical review of non-monetary evaluation and comparison techniques. Two areas of methodology, each with opposing goals, may be distinguished. One seeks absolute values for intangibles; the other, relative values. Most authors reviewed agree on the need for a uniform approach allowing wider comparative evaluations. It is generally agreed that with minor modifications, methods suggested by Clawson (1959) are most expedient. The problem of inaccuracies in value estimates is thoroughly reviewed. (Weaver-Wisconsin)

PERUVIAN FISHERIES: CONSERVATION AND DEVELOPMENT.
California State Univ., Fresno.
B. B. Smetherman, and R. M. Smetherman.
Economic Development and Cultural Change, Vol 21, No 2, p 338-351, 1973. 2 tab, 46 ref.

Descriptors: *Conservation, *Commercial fishing, *Economic impact, Export, Economic efficiency. Marketing, Fish harvest, International waters, Regulation.
Identifiers: *Economic development, *Peru, *Fish meal, Anchovies, Development linkages, Nationalization, Guano.

Accelerated development of Peru's fishing industry has resulted from the growth in the production of fish meal from anchovies. The effects of this development on Peruvian politics and economics is reviewed. The economic history of Peru indicates its successive failures to channel primary resource booms into sustained economic growth. However, regulation of the anchovy resource has been attempted, and is becoming more effective. Regulation schemes have included encouragement of industrial self-restraint, imposition of closed seasons, and regulation of technology to control catch. In addition, Peru joined with other countries to organize and control the industry, and eventually nationalize fish meal marketing. The fishing industry's role in economic development is small as shown by the limited number of forward linkages that have accrued. However, the industry is very important for generating export income, and stimulating backward linkages and the consequential employment. The present government intends to expand the industry and use it as a base for sustained economic development. (Weaver-Wisconsin)

EXTINCTION OF A FISHERY BY COMMERCIAL EXPLOITATION: A NOTE,
London School of Economics and Political Science (England).
J. R. Gould.
Journal of Political Economy, Vol 80, No 5, p 1031-1038, 1972. 4 fig., 7 ref.

Descriptors: *Commercial fishing, *Economics, *Exploitation, Fish populations, Sustained yield, Yield equations, Mathematical models.
Identifiers: Extinction, Catch locus.

Inferences concerning the inability of the economic theory of commercial fishing to incorporate possible extinction of a fishery as drawn by Vernon Smith (1969) are reexamined. Traditional theory, as illustrated by analysis of the sustainable yield function of fishing effort, is shown to provide the basis for Smith's inference. A reformulation of this model provides a stronger analytical tool for the discussion of extinction. This reformulation introduces economic considerations via a catch locus and biological factors via a natural population increase curve. It is shown that commercial extinction of a fish population is conceivable despite the fact that fishing would become unprofitable long before the population of a given species was wiped out. This follows from the notion of minimum biologically viable population. (Weaver-Wisconsin)

WATER RESOURCE DECISON MAKING--HOW EFFECTIVE IS THE PUBLIC INPUT,
Oregon State Univ., Corvallis.

J. G. Monks.
In: 1973 Proceedings of the 19th Annual Meeting, 'Realism in Environmental Testing and Control,' April 2-5, 1973, Anaheim, California, p 345-350. 2 fig, 4 ref.

Descriptors: *Water resources development, *Decision making, *Social values, *Water Allocation (Policy), Social impact, Social aspects, Administration, Optimum development plans, Political aspects, Project planning, Benefits, Project post-evaluation, Standards, Social participation, *Oregon.
Identifiers: Case study, *Junction City (Ore.), Public preferences.

Natural resource management often necessitates that society collectively undertake development and control activities. However, in order that the governing system serve to achieve allocative efficiency as well as the results the public wants, resource management objectives must be clearly delineated, and progress monitored and carefully directed to insure that activities are carried out according to plan. The Junction City (Oregon) Water Control District was used as a case study of the current structure of water management to determine whether it satisfied these requirements. Beginning with its historical background, the effectiveness of the allocation process is questioned as to whether the objectives were defined in the terms of public interest and its developmental and control capabilities. It is concluded that standards for social or ecological outcomes were not precisely defined nor were outcomes a democratic representation of the project area population's preference. Legislation was used to benefit a few citizens at the expense of the many. In addition, the allocation structure did not effectively control adverse environmental effects which are of concern to the public. (Weaver-Wisconsin)

EXTERNALITIES, WELFARE, AND THE FEASIBILITY OF CORRECTIVE TAXES,
State Univ. of New York, Stony Brook.
R. Dusansky, and P. J. Kalman.
Journal of Political Economy, Vol 80, No 5, p 1045-1051, September/October 1972. 1 ref.

Descriptors: *Welfare (Economics), *Economic efficiency, *Mathematical models, *Optimization, Taxes.
Identifiers: *Corrective taxes, *Pigouvian tax policy, Profit maximization, Separable cost functions, Subsidies, Technological externalities, Cost functions.

Implementation of the Pigouvian tax policy for correcting technological externalities is dependent on the nature of cost functions faced by the relevant firms. The Pigouvian approach assumes separable cost functions where the marginal costs of the firm are dependent only on its own output. Given such cost functions the policy maker may impose corrective unit taxes (or subsidies) such that the actual outputs arrived at by individual profit maximization equal those deemed optimal as a result of social welfare maximization. In the case of non-separable cost functions, the marginal cost functions of the firms involved are interdependent. Because profit maximization decisions of individual firms are not independent of the output of other firms, selection of corrective taxes is severely complicated, if not made impossible. Given a partition of the assumed n-firm economy, the necessary and sufficient conditions for separability are solved for the class of cost functions consistent with feasible implementation of Pigouvian tax policy. Similarly, the feasible set of cost functions is derived given the assumption of multiproduct firms. Finally, these sets of feasible cost functions are shown to include a wider range than indicated by the Davis and Whinston results. (Weaver-Wisconsin)

COSTS AND PROFITABILITY IN THE COMMERCIAL FISHING INDUSTRY: THE INSURANCE DILEMMA,
Washington Univ., Seattle. Div. of Marine Resources.
M. L. Redfield.
Washington Sea Grant Publication WSG-MP 71-4, November 1971. 59 p 6 fig.

Descriptors: *Commercial fishing, *Insurance, *Cost-benefit analysis, Safety, Return (Monetary), Working conditions, Obsolescence, Costs, Profits, Trade associations, Compensation, Damages, Competition.
Identifiers: Foreign competition, Local competition, Policy formulation.

Insurance coverage constitutes a disproportionate share of the sharply increasing costs of operating a fishing vessel; this threatens the viability of the United States' fishing industry in the face of foreign competition. The current study found that high insurance costs reflected high vessel casuality rates caused by extreme competitive pressures and low profits. This condition follows from high labor costs, high costs of boats and equipment, which are required by law to be of United States manufacture (and consequently are more costly), the influence of price competition with imports and the system of free entry which reduces the catch of each participant. These high costs, combined with low profitability, result in deteriorating equipment and working conditions (smaller crews, longer hours, more intensive effort), an older labor force, and thus increased accidents. Alternatives for maximum reduction of insurance expenses include (1) schemes for continuing private insurance, (2) eliminating barriers against purchase and use of foreign equipment, (3) instituting limited entry to the industry, and (4) laissez-faire. Choice among alternatives must be based upon cost-benefit analysis. Limited comparison indicated that an optimal program will consist of safety regulation combined with alternatives (1) or (2). (Weaver-Wisconsin)

VALUATION OF TIMBER, FORAGE AND WATER FROM NATIONAL FOREST LANDS,
Forest Service (USDA), Tucson, Ariz. Rocky Mountain Forest and Range Experiment Station.
P. F. O'Connell.
The Annals of Regional Science, Vol 6, No 2, p 1-14, 1972. 3 fig, 18 ref.

Descriptors: *National forests, *Lumbering, *Forage, *Value, Linear programming, Land management, Economic efficiency, Public lands, Recreation demand, Water demand, Profit, Market value, *Arizona.
Identifiers: *Salt-Verde Basin (Ariz.), Resource valuation, Multiple-use linear programming, Relative price trends.

A procedure for determining relative trade-off values for timber, forage and water resources is presented. Such a procedure is essential for resource management decisions concerning changes in water yields within a watershed. Data used are specific to the Salt-Verde Basin in central Arizona, but the methodology is applicable to any National Forest lands. Prices in the primary resource markets fail to reflect the full value of those resources to society because of market imperfections, administrative procedures, and various institutionalized constraints. Since each of the resources is an input for a product sold in markets characterized by competitive conditions, a range of resource values was derived from a simple valuation model based upon the price of secondary products such as lumber, livestock, and feed grains. Resource value was assumed to be within limits set by market prices paid and maximum prices manufacturers could pay. A multiple-use linear programming model is suggested to determine optimal land management programs given the needs of the public as projected from relative price trends of the secondary products studied. Future demand-supply conditions are expected to increase the value of timber output relative to the value of water and forage output. (Weaver-Wisconsin)

DETERMINATION OF PUBLIC ENVIRONMENTAL PREFERENCES IN WATER RESOURCES PLANNING AND DEVELOPMENT,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering; and Clemson Univ., S.C. Dept of Economics.
Benjamin C. Dysart, III, and Andy H. Barnett.
In: American Society of Civil Engineers Annual and National Environmental Engineering meeting, October 18-22, 1971, St. Louis, Missouri. 28 p. 2 fig., 7 tab. OWRR B-017-SC (6).

Descriptors: *Surveys, *Social values, *Planning, *Water quality, Social participation, Water pollution control, Industrial wastes, Correlation analysis, Water resources development, Decision making, *South Carolina.
Identifiers: *Public preferences, *Greenville County (S.C.), Reedy River (S.C), Willingness-to-pay, Mail questionnaire.

A crucial element of the water resources planning process is the evaluation of public environmental preferences early in the plan's formulation. The mail questionnaire technique was employed to provide reliable information and minimize the time, difficulty and expense. Although public referenda authorize specific development plans, the reported technique approximates acceptable expenditure levels and indicates which sectors of the populace might respond to additional educational efforts concerning the desirability of the project. The feasibility of implementation of water quality improvement plans for Greenville County, South Carolina, was used as a case for study. Response to the mail questionnaire established an ordinal preference ranking of potential uses of the Reedy River with scenic appeal ranking first. Correlation analysis of public ranking of critical problems indicated that water pollution was third to crime and education. Preference analysis indicated that the public supported increased expenditure for water pollution control and that residents were willing to bear what they considered to be a reesonable cost of a significant level of improvement in environmental quality. ELEMENTS OF THE WATER RESOURCES SITUATION IN ALABAMA,
Geological Survey, University, Ala.
D. B. Knowles, and H. C. Barksdale.
Available from NTIS, Springfield, Va 22151 as PB-214 181. Price $3.75 printed copy; $1.45 cents

microfiche. December 1969 (revised August 1970). 28 p.

Descriptors: *Water resources development, *Administration, *Alabama, Project planning, Water utilization, Hydrology, Flood plains, Streamflow, Low flow, Waste disposal, Water pollution control, Gaging stations, Observation wells, Water quality, Estuaries, Reviews.

The water-resources situation in Alabama has many facets ranging from water supply to waste disposal, from floods to droughts, and from navigation to recreation. Within this wide range of topics two common elements have been selected for consideration-- factors intimately related to the hydrologic cycle, and significant areas wherein the knowledge and data are inadequate. A discussion of the hydrologic cycle provides a background of understanding. This is followed by a discussion of the types of data and studies that are required for a better understanding of water related problems with recommendations for needed supplemental or additional studies. Most water-resources problems relate in one way or another to the availability of water. Problems of water supply cover much of the water-resources field and are not restricted to the availability of water for domestic, industrial, or agricultural purposes. Under this concept, water for operation of navigational locks, dilution of wastes, launching of a boat or for support of fisheries all become water-supply problems. It is in this broader sense that water-supply problems and the knowledge and data needed for their solution are discussed. (See also W73-12315) (Woodard-USGS)

Identifiers: Symposium.

This is the last in a three-part series of public information reports based on an October 1970 University of Wisconsin Sea Grant Conference, 'The Great Lakes-Sink or Swim.' One of the issues that frequently is identified in Great Lakes research is the problem of multiple use and the attendant conflicts that the users may face. In the past these conflicts seemed inevitable but not catastrophic. Population and use rate, however, is increasing, and the interference from one user to the next is demanding more attention to resource management practices. The University of Wisconsin Sea Grant program has attempted to look at the use pattern as a starting point for problem identification. This part contains the following papers: Our Environmental Equilibrium in Nature, by D. V. Anderson; A Symposium on the Preservation and Multiple-Use Problems in the Great Lakes, by P. M. Higgins; Toward a Regional Policy for the Great Lakes, by J. L. Hazard; the Planning Viewpoint, by D. C. N. Robb; and An Industrial Point of View 1970, by S. Burnstein. OUR ENVIRONMENTAL EQUILIBRIUM IN NATURE,
Toronto Univ. (Ontario).
D. V. Anderson.
In: Multiple-Use Problems in the Great Lakes; Wisconsin University Sea Grant Report WIS-SG-72-107 (Public Information Report No 7), p 7-13, 1972.

Descriptors: *Regional development, *Great Lakes, *Water resources development, *Water policy, Environmental effects, Environmental control, Water pollution control, International waters, Economic aspects, Social aspects, Legal aspects, Water demand, Water supply, Water quality, Ecology, Water utilization, Management, Multiple-purpose projects, Reviews.
Identifiers: Symposium.

The public must decide how active the control of the development of the shores of the Great Lakes should be before the water managers can begin to act. Several areas of decision are: whether the cities should be allowed to make use of lake bottoms for extending valuable lakeside real estate; whether to protect the north shore of Lake Erie from erosion, the major source of pollution in the lake, by constructing polders; whether to place the dykes a mile offshore to claim 100 sq mi land, rather than to maintain the status quo; whether to attempt to sustain aquatic life; whether to site powerplants for warming harbor waters and canals, or for power needs only; and finally, whether to stop discharging sewage into the lakes and what treatment to use. TOWARD A REGIONAL POLICY FOR THE GREAT LAKES,
Michigan State Univ., East Lansing.
J. L. Hazard.
In: Multiple-Use Problems in the Great Lakes; Wisconsin University Sea Grant Report WIS-SG-72-107 (Public Information Report No 7), p 23-34, 1972. 15 ref.

Descriptors: *Regional development, *Great Lakes, *St. Lawrence Seaway, *Water policy, *Environmental control, Planning, Water resources development, International waters, Federal Government, State governments, Economic aspects, Social aspects, Water demand, Water supply, Water utilization, Multiple-purpose projects, Management.

An overview of the Great Lakes-St. Lawrence system is presented to inform the general public as well as industrial and political decision makers. The movement toward a regional policy might take on more coherence as it matures by increasing efforts toward: achieving cohesive regional units around the lakes; identifying changing regional needs and goals; gaining a systematic knowledge of the lakes, their behavior and condition; developing programs that satisfy the needs of the present and future generations; and implementing those programs through appropriate channels--regional, federal, dominion--and now, responsive modes of organization. These steps would provide flexible policies for the lakes. And if successful in this major endeavor, it will be possible to move toward the following objectives over the long run: to preserve and improve the lakes; to expand the mid-continent economy; to enhance the region's contribution to the external world; and to harmonize working relations with the provinces and Canada. (See also W73-12960) (Woodard-USGS)

THE PLANNING VIEWPOINT,
Great Lakes Basin Commission, Ann Arbor, Mich.
D. C. N. Robb.
In: Multiple-Use Problems in the Great Lakes; Wisconsin University Sea Grant Report WIS-SG-72-107 (Public Information Report No 7), p 35-45, 1972.

Descriptors: *Regional development, *Great Lakes, *Water policy, *Environmental control, Planning, Water resources development, International waters, Legal aspects, Economic aspects, Social aspects, Water demand, Water supply, Water utilization, Multiple-purpose projects, Management.

The Great Lakes are used for water supply, transportation, recreation, power, fish, and as dumps for solid and liquid waste disposal. The lakes have a very large, but still limited, capacity to support any one of the above uses. In addition, as individual uses increase, they begin to conflict with each other. Transportation, with its demand for high lake levels, encourages conditions which result in shore erosion with negative effects on water supply, recreation and fish. Increasing use of the lakes for waste disposal creates problems for fish, recreation, water supply and, to a limited extent, for power. The demands on the lakes from all of the above uses are dependent to a large extent on both population and per capita demand, both of which continue to increase. Serious attention is just beginning to be paid to the possibilities of managing population and per capita demand toward partial solution of present environmental problems. Effective resource management requires: clearly defined goals and objectives; adequate data on present conditions; adequate procedures to predict consequences on the resources of alternative future actions; clear definition of responsibility and authority; and adequate funding. W73-12964

AN INDUSTRIAL POINT OF VIEW-1970,
Wisconsin Electric Power Co., Milwaukee.
S. Burnstein.
In: Multiple-Use Problems in the Great Lakes; Wisconsin University Sea Grant Report WIS-SG-72-107 (Public Information Report No 7), p 47-51, 1972.

Descriptors: *Regional development, *Great Lakes, *Water resources development, *Water policy, *Environmental control, Industry, Electric power industry, International waters, Economic aspects, Social aspects, Legal aspects, Water demand, Water supply, Water utilization, Multiple-purpose projects, Management.

The Great Lakes present a unique natural resource whose utilization has sponsored the basic activities of over 60 million people who live around its shores. Continued use of this resource is unavoidably tied to the welfare of these millions. Preservation of the quality of this resource is essential to its continued use. The multiple uses of the Great Lakes, with minor omissions, are discussed in five basic categories: drinking water and sanitation; transportation; industrial processes; food supply; and recreation. Industry is a summation of all the other uses. It is impossible for drinking water and sanitation to serve the vast population of the region without piping and power and the waterworks and the public works that industry provides. A transportation industry on the lakes, commercial fishing industries, and even a recreational industry, are all typical of those devices which in their specialized areas create or enhance the value of things. The electric power industry, which is perhaps the key to all other industrial and economic development, is the largest nonconsumptive water user on the Great Lakes. CONSTRUCTION COSTS OF WATER SUPPLY AND SEWAGE NETWORKS IN POLAND--1961-1970,
Institute of Public Utility Services, Warsaw (Poland).
M. Gorczyca.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 98, No SA6, p 9458-1003, 1972. 3 fig, 8 tab.

Descriptors: *Construction costs, *Water supply, *Sewage, *Cost analysis, Estimated costs, Direct costs, Unit costs, Return (Monetary).
Identifiers: *Warsaw (Poland), *Lodz (Poland), Profitability, Cost, *Poland.

The Institute of Public Utility Services at Warsaw, Poland, has studied the building costs of water supply and sewage networks in order that any cost fluctuations may be continuously supervised, compared with building estimates, and profitability assessed. The factors isolated as primary determinants of these costs included the following site features: (1) hydrogeological conditions, (2) costs of removal of previous installations, (3) technical, economic and organizational solutions used by contractors, (4) unusual construction conditions, and (5) the level of estimated prices for construction assembly work and production factors. A classification and calculation scheme is presented for the analysis of building costs. Direct costs are those associated with a specific site while general costs are site-unrelated. Unit costs of building data indicated considerable variation in costs between various pipe cross sections and materials. Analysis of these costs for the period 1961-1970 with a combined index indicated a strong price preference for asbestos-cement pipes. Despite price increases during the same period, a steady trend of profits had prevailed. (Weaver-Wisconsin)

OUTDOOR RECREATION IN THE BALTIMORE AREA.
Regional Planning Council, Baltimore, Md.

July 1967. 156 p, 23 fig, 21 tab, 56 ref, 1 append.

Descriptors: *Recreation, *Recreation demand, *Watersheds, Planning, Models, Projections, Standards, *Maryland, Regional analysis, Regional development.
Identifiers: Open space, Regional Planning Council, *Baltimore region, Water-based recreation.

Study focuses on specific needs and preferences of people in the five-county Baltimore region and looks at recreation and open space in terms of several types of activities. A key element in this analytical approach is the recreation trip distribution model which projects the number and location of trips for various recreation purposes. The recreation plan is based on a system of open space corridors proposed in the Council's Suggested General Development Plan and includes numerous park areas and activities to be incorporated within this framework. These activities include swimming, picnicking, fishing, bicycling, boating, camping, hiking, and driving for pleasure. Special attention is placed on use of individual watersheds in the region and the demand-supply relationships for each watershed. (Elfers - North Carolina)

(1972)

Descriptors: *Insurance, *Flood damage, *Flood protection, *Virginia, Land use.
Identifiers: National Insurance Program, Insurance coverage.

Basic public information is presented to Virginia residents of flood-prone communities of the danger of floods, their potential damage, or control, and opportunities for flood insurance through the National Flood Insurance Program. This low cost insurance program requires that governmental bodies of insured communities plan and adopt land-use and Land management measures that will reduce flood loss. Protection from economic loss is provided while at the same time potential losses are reduced. Coverage includes most structures and their contents up to specified limits. An Emergency Program allows for coverage during the interim period in which land use plans are being formulated and implemented. Public support is encouraged and recommendations are made for specific community actions to obtain this insurance. (Weaver-Wisconsin)

The critical experimental design parameters elucidated by a software-oriented study were considered and the translation to hardware-oriented instrumentation is described. The hardware device was evaluated experimentally in the laboratory and the capabilities compared to the software-generated experimentation. Results indicate the essentially identical analytical performance is achieved at greatly reduced complexity of operation and expense. In addition, the hardware-oriented instrumentation provides the capability for greater measurement rates. (Holoman-Battelle)

Descriptors: *Water pollution sources, *Lake Erie, *Lake Ontario, *Remote sensing, *Aerial photography, Thermal pollution, Sediment transport, Algae, Industrial wastes, Effluents, Path of pollutants, Satellites (Artificial), Instrumentation.
Identifiers: *ERTS.

An evaluation of ERTS projects is presented for the fourth bimonthly reporting period, October to December 1972. A NOAA Buffalo Dehavaland Aircraft was instrumented with a multispectral camera and dual-channel IR scanner for environmental studies of Lake Erie and Lake Ontario. The Buffalo aircraft flew most of the Lake Erie shoreline west of Long Point, Ontario, and Ashtabula, Ohio. ERTS-1 crossed Lake Erie while the Buffalo was imaging the Canadian shoreline. Major features observed were: thermal and sediment features off Pointe aux Pins and Pointe Pelee; a thick algal mat in the Bass Islands area several hundred feet wide and 10-15 miles long; a portion of the Cuyahoga River plume at Cleveland; powerplant effluent near Monroe, Michigan; and Detroit River and Lake St. Clair. The western side of Lake St. Clair was black. Expected accomplishments for the next reporting period are outlined. (Woodard-USGS)

VARIABLE SAMPLING FREQUENCY - A NEW ADAPTIVE TECHNIQUE,
A. A. Sutherland, Jr.
Control Engineering, Vol 20, No 4, p 33-35, April 1973. 3 fig, 1 ref.

Descriptors: *Sampling, *Antomatic control, Control systems, Monitoring, Algorithms.
Identifiers: *Adaptive control.

An adaptive technique has been developed for sampling for control of plant processes which vary randomly with time. A simple digital algorithm samples plant status according to the frequency of variation--less frequent sampling with slow variations and more frequent sampling with increased variations. The method purportedly provides control action economy and good predictability of plant behavior. (Little-Battelle)

HEATED SENSORS FOR FLOW MEASUREMENTS,
R. Wasserman, and H. Grant.
Instruments and Control Systems, Vol 46, No 5, p 59-61, May 1973. 4 fig, 4 tab.

Descriptors: *Water temperature, *Flow rates, *Viscosity, *Reynolds number, *Thermal conductivity, Temperature, Electrical equipment.
Identifiers: *Hot wire sensors, *Hot film sensors, Sensors.

Heated sensors consist of electrical probes connected to a bridge circuit which provides a current flow to maintain the temperature of the probe above ambient. By knowing characteristics of the fluid to be measured and the probe, it is possible to measure temperature, viscosity, Reynolds number, thermal conductivity, and mass flow. Where fluid temperature fluctuates, errors in mass flow measurements can be compensated for by computation or by using an additional unheated sensor. Measurement circuits may employ either constant temperature or constant bridges depending on the requirements of the system. Probes are constructed of platinum, tungsten, or platinum-iridium wire of 0.00008 to 0.001 inch diameter or of films of resistance material plated on ceramic or quartz substrates. A comparison of the performance characteristics of wire and film probes in various fluids is given. (Little-Battelle)

SELECTIVITY OF TOWED-NET SAMPLERS,
National Marine Fisheries Service, Honolulu, Hawaii. Southwest Fisheries Center.
R. A. Barkley.
U S Natl Mar Fish Serv Fish Bull. Vol 70, No 3, p 799-820. 1972. Illus.
Identifiers: Animals, *Nekton, Nets, *Plankton, *Samplers, Selectivity, Towed nets.

The ideal sampler for plankton and nekton is one whose selective characteristics are known to be appropriate to any given problem, so that it catches the right organisms, and rejects others, with known efficiency. A quantitative theoretical analysis of 1 aspect of selectivity, avoidance of towed-net samplers is presented. The theory is evaluated against 3 sets of paired samples obtained by different nets at different speeds to provide absolute and relative tests of its validity. A single sample obtained by 1 net towed at 1 speed is then analyzed to illustrate the procedure. Final evaluation of the theory awaits studies of animal behavior when confronted by a sampler, but the theory provides informative and reasonable interpretations of plankton and nekton catch data, particularly estimates of population abundance and mesh losses, even when behavior of the animals is not known.--Copyright 1973, Biological Abstracts, Inc.

A SIMPLE METHOD FOR RECORDING FISH HEART AND OPERCULUM BEATS WITHOUT THE USE OF IMPLANTED ELECTRODES,
Maine Univ., Orono. Dept. of Zoology.
S. A. Rommel, Jr.
Journal of the Fisheries Research Board of Canada, Vol 30, No 5, p 693-694, May 1973. 1 fig, 4 ref.

Descriptors: *Electrodes, *Fish physiology, *Methodology, Fish, Atlantic salmon.
Identifiers: *Heart rate, *Opercular beats, Electrocardiograms, Anguilla rostrata, American eel, Salmo salar.

A method is described by which heart and opercular beats can be recorded from gently restrained, freely-swimming fish without implanting electrodes. The fish were restrained in soft plastic mesh cages so that the long axis of the body was usually aligned in one direction. Electrodes, consisting of carbon rods with leads to a polygraph, were fastened to either end of the cage. Electronic filtering was used to eliminate low frequency swimming movements and high frequency electrical noises. Atlantic salmon and American eel were used in the tests. The method was usable in waters with resistivities between 4000 ohm-cm and 400 ohm-cm. Best results were obtained in water of about 1000 ohm-cm. Excellent agreement was obtained between the water electrode recording and implanted electrode recordings. The method can minimize fish handling in some physiological experiments. (Mortland-Battelle)

GEOHYDROLOGY OF THE DOVER AREA, DELAWARE,
Delaware Geological Survey, Newark.
K. D. Woodruff.
Hydrologic Map Series, No 1, 1972. 1 sheet, 1 map, 7 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water quality, *Delaware, *Maps, Hydrographs, Water wells, Pumping, Drawdown, Groundwater recharge, Rainfall, Aquifers, Chemical analysis.
Identifiers: *Dover (Del).

Total groundwater use in the Dover, Del., area, principally by the city of Dover and the Dover Air Force Base to the southeast, is around 6 to 8 mgd. About 6 to 7 mgd is pumped from the Cheswold aquifer while the remainder comes from the Piney Point Formation. Outside the areas served by public wells, most domestic water comes from the Columbia Formation or the Frederica and Cheswold aquifers. Several large irrigation wells are located where either the Frederica or Cheswold aquifers subcrop directly beneath sands of the Columbia Formation. The Cheswold aquifer is presently being consistently overpumped by about 1-2 mgd and records also indicate that levels in the Piney Point Formation are dropping, particularly during the summer months. Transmissibilities for the Cheswold aquifer range from about 11,000 gpd/ft to the south of Dover to about 33,000 gpd/ft near the middle of Dover. Coefficients of storage range from 0.0003 to 0.006. Transmissibilities in the Piney Point Formation vary from 6,000 gpd/ft north of Dover to 36,000 gpd/ft southeast of Dover. Except in the extreme northern part of the area aquifers beneath the Piney Point contain water having chloride concentrations greater than 250 mg/l. Maps and illustrations describe the hydrogeology and water quality. (Woodard-USGS)

HORTON'S 1945 STUDY: A CARTOBIBLIOGRAPHY,
Indiana Univ., Bloomington. Dept. of Geography.
M. C. Roberts, and D. A. Cobb.
Geological Society of America Bulletin, Vol 84, No 8, p 2733-2735, August 1973. 1 tab, 1 ref.

Descriptors: *Maps, *Hortons law, *Bibliographies, *Geomorphology, Topography, Terrain analysis, Drainage patterns (Geologic).

All the topographic maps used in Horton's classic 1945 paper are listed. Two obstacles face the researcher in attempting to use Horton's data. In the first place, all of the maps used by Horton have either been revised, replaced by large-scale maps, or are out of print (therefore, current U.S. Geological Survey indexes of topographic maps are of little value because they list only those quadrangles presently available). The second obstacle is that in the paper Horton refers to drainage basins and other physical features for which he does not list the topographical map sources even though he uses them. These obstacles are removed by providing a complete list of all the topographic maps used in the study. (Knapp-USGS)

HIGH SPEED A-D CONVERTERS IN A MEMORY TEST SYSTEM,
Inter-Computer Electronics, Inc., Lansdale, Pa.
J. J. Connolly, and M. Rosenbaum.
Computer Design, Vol 12, No 2, p 86, 88, 89, February 1973. 2 fig.

Descriptors: *Date transmission, *Data processing, Digital computers, Automation, Instrumentation, Mechanical equipment, Automatic control.
Identifiers: *Analog to digital converters, Digital sampling systems, On-line computers, Buffer memory systems, Data gathering systems, Computer memory.

A low repetition rate digital sampling system is described in which a buffer storage unit provides a reduction in data rate so that digital samples may be processed and analyzed by an on-line computer. This computer may be either a special-purpose digital processor, or a general-purpose device

wherein digital data sample analysis is accomplished by means of a software program. A block diagram is given of the memory data gathering system using an A-D converter. This system will take five samples of the sense amplifier output at 50-ns intervals, convert the analog value of each sample to a 6-bit digital number, and place these numbers in five storage buffers. The converter has a sampling rate capability of up to 20 million samples/s, accuracy of plus or minus 0.8 percent FS plus or minus 1/2 LSB, and is TTL compatible. A 4-bit delay code defines the 100-ns multiple that must elapse after acceptance of an external convert command before actual sampling of the sense amplifier output signal begins. (Holoman-Battelle)
W73-12891

A METHOD FOR HIGH SPEED BCD-TO-BINARY CONVERSION,
Bendix Corp., Kansas City, Mo.
L. C. Beougher.
Computer Design, Vol 12, No 3, p 53-59, March 1973. 6 fig, 11 ref.

Descriptors: *Methodology, Digital computers.
Identifiers: BCD to binary conversions, *Conversion systems, Computer memory, Converters.

The BCD-to-binary design proposed as a high speed coded number converter can translate an 8-digit BCD number into a 27-bit binary number in 60 ns. The method is sufficiently fast to complete the process within one computer memory cycle of any available digital computer. High speed conversion of the number provides assurance that the input data to the computer will be in binary form at any time computer instructions request it. The design architecture was implemented using Schottky-clamped TTL integrated circuits. A less costly configuration can be obtained by using standard TTL integrated circuits such as the 74181 arithmetic logic unit and 74182 carry-look-ahead generator but results in a sacrifice of conversion speed. When standard TTL logic circuits are used, the converter can be expected to convert an 8-digit BCD number into a 27-bit binary number in approximately 150 ns, which is sufficiently fast for many applications and provides a saving of initial component costs. (Holoman-Battelle)

BOOST A/D RATES WITH STAGGERED OPERATION,
Grumman Aerospace Corp., Moriches, N.Y.
H. Baluta.
Electronic Design, Vol 21, No 4, p 54-57, February 15, 1973. 5 fig, 1 tab.

Descriptors: Design criteria, *Rates, Interfaces, Timing, Design standards, Velocity.
Identifiers: *Digital to analog converters, *Conversion speed, Timing constraints.

The operation of two interleaved a/d converters is discussed in order to clarify the details of interface circuit requirements versus the number of converters used. Conversion speed is doubled by the interconnection of two converters; however, external timing constraints limit the attainable speeds. (Holoman-Battelle)

Identifiers: Foreign studies, *Structural concrete, Supports, Bending moments, Plates, Torsion, Axial loads, Ultimate strength design, Theoretical analysis, Comparative studies.

An analytical method is presented for predicting strength of a corner column-slab connection in a flat plate structure subjected to bending moments or combined bending and axial load through the column stubs. The column side to the effective slab depth ratio, r/d, concrete and steel properties, steel configuration near the column-slab interface, and the moment to shear ratio are considered. The ultimate strength method of analysis for the reinforced concrete elements is based on the assumption of an idealized mode of failure. Flexural, torsional, and shear resistance of the idealized slab sections framing into the column was based on recent research into torsional and shear strength of beams. Equilibrium and compatibility are satisfied at ultimate load and the concrete in the compression zone above the head of the failure crack must reach some critical stress condition. Basic assumptions used in the method are discussed and the derivation presented. Validity was determined from comparisons of theoretical predictions with available test results; excellent correlation was obtained. Recommendations for application and a numerical example are given. Identifiers: *Reservoir capacity, Flood hydrographs, Stochastic models, Computations.

A simple approach is presented for solving the problem of designing adequate reservoir storage capacity with available data consisting of a lengthy record of monthly rainfall and a short record of monthly runoff. The procedure permits the synthesis of long streamflow sequences without encountering the problems associated with selection and fitting of suitable models to observed runoff series. This approach is particularly applicable in developing countries where data available is inadequate. Three principal model components used are: (1) COR, rainfall-runoff model, (2) TSA, time series analysis of observed monthly rainfall sequence (synthesis of a long rainfall series), and (3) RES, simulation of reservoir operation. Basic premises and mathematical operations of these components are presented. The models were applied to several river systems and the results compared with observed streamflow data. Experience shows that the required reliability of the target withdrawal is an important factor in determining necessary storage. For a given draft, particularly one approaching the mean inflow, the required storage is extremely sensitive to reliability. For a given reliability, increases in target withdrawal require increasingly larger increases in storage. (USBR)

Since the first application of the prestressing technique to Cheurfas Dam, Algeria, in 1937, use of cable prestressing in dams has grown rapidly. The technique has been applied successfully to strengthening and raising numerous old dams and to construction of several new dams. To design the most economical sections, an outline of prestressing techniques in dam construction and the analysis of stresses in the dam and the foundation are presented. Studies using the theory of elasticity show that the prestress load is effective for economical design of a dam up to a height of about 80 m for a load of 200 metric tons per meter. Maximum spacing of anchors may be limited to 6.0 m and should be located about 1.5 m from the upstream face. With constant prestress force, horizontal tensile stress will decrease as the depth of the anchorage increases, but with the same depth, cracks may appear with higher prestressing force. Stress coefficients for different locations in the foundation for the internal concentrated load are tabulated. Actual stresses in metric tons per meter squared can be calculated by multiplying the coefficients by the prestressing forces in metric tons per meter and dividing by the depth of anchor d in meters. Descriptors: *Channel improvement, *Hydraulic models, *Shoals, *Alaska.
Identifiers: *Navigation channels, *Gastineau Channel (Alas).

A model study was conducted to determine the best means of resolving the shoaling problem in the Gastineau Channel, Alaska. The model, constructed to linear scale ratios of 1:500 horizontally and 1:100 vertically, reproduced about 7 miles of Gastineau Channel from Fritz Cove on the west to 1 mile north of Juneau, Alaska, on the east. It was equipped to reproduce and study prototype tides, tidal currents, freshwater inflow, and shoaling. The shoaling tests were conducted using granulated plastic to simulate the natural sediments, and a technique was developed to properly reproduce the prototype shoaling pattern and distribution. It was determined from the model tests that any one of several impermeable dikes with a top elevation above high water and located along the north side of the navigation channel would reduce shoaling by 80 to 85 percent. Diversion of Fish Creek away from the navigation channel would result in an additional 5 percent reduction. The shortest dike tested (plan 4) was 17,250 ft long, and the shoaling reduction for this plan was essentially the same as that for longer dikes. (WES)

Available from NTIS, Springfield, Va 22151, as AD-754 535 Price $3.00 printed copy; $1.45 microfiche. Technical Report H-70-13, December 1972. 17 p, 1 fig, 9 plate, 4 photo.

Descriptors: *Spillways, *Dams, *Illinois, Hydraulic models, Design flow, Discharge (Water).
Identifiers: *Oakley Dam (Ill).

The plans for the Oakley Dam project, Illinois, were changed by modification of the spillway design. These modifications, involving lowering the elevation of the spillway crest, decreasing the length of the spillway, and extending the gate piers upstream were tested in a hydraulic model. Approach flow conditions with the revised spillway installed were generally satisfactory, although the decrease in spillway height increased the velocity along the abutment wraparounds and increased drawdown and contraction in the end bays of the spillway. The capacity of the spillway was adequate; the maximum discharge of 150,000 cfs was passed at a pool elevation of 661.0 with the original abutments and 661.6 with the proposed design abutments. With the spillway reduced in elevation, better energy dissipation was obtained with two rows of baffle piers on the downstream portion of the apron (type 8 basin) rather than with the chute blocks and one row of baffles with the orininal spillway (type 6 basin). A flow of about 35,000 cfs could be passed through the two bridges below the structure without overtopping the roadway. Riprap having an average stone size of 400 lb was required for a distance of 60 ft downstream of the stilling basin; 15-lb stone should suffice for the rest of the exit channel. Additional protection should be provided at the abutments of the bridge. (Knapp-USGS)

COMPUTING BACKWATER AT OPEN CHANNEL CONSTRICTIONS,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
J. W. H. Barrett, and G. V. Skogerboe.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY7, Paper 9841, p 1043-1056, July 1973. 9 fig, 2 tab, 10 ref, append. AID Contract csd-2460.

Descriptors: *Flow profiles, *Backwater, *Open channel flow, Non-uniform flow, Subcritical flow, Flow around objects, Bridges.
Identifiers: Open channel constrictions.

A subcritical (submerged) flow analysis for open channel constrictions was modified to provide an improved technique for computing the backwater resulting from constrictions. Application of the method to results from model studies provides a more accurate prediction of the effects of a contraction on open channel flow than the methods currently in use. Of particular advantage is the applicability of the proposed technique to any flow condition or regime and its independence of channel slope. (Knapp-USGS)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY7, Paper 9831, p 1027-1041, July 1973. 13 fig, 2 tab, 4 ref, append.

Descriptors: *Roughness (Hydraulic), *Stage-discharge relations, Discharge (Water), Backwater, Open channels, Open channel flow, Channel improvement, Hydraulic design.

In the hydraulic design of a channel improvement scheme, special attention is focused on the synthesis of the stage-discharge relationship for the downstream end of the improvement reach. In the absence of more directly applicable information, the design of the tail-water rating curve is based on the roughness characteristics of the river channel. Roughness is deduced from a combination of the high-water mark and flood flow which were recorded during the occurrence of a hurricane over the watershed. Manning roughness coefficient is 0.225 for the channel reach under consideration. This value is larger than corresponding predictions made on the basis of conventional methods for estimating n. FINAL ENVIRONMENTAL STATEMENT: SMALL BEACH EROSION CONTROL PROJECT, BROADKILL BEACH, DELAWARE.
Army Engineer District, Philadelphia, Pa.

Available from NTIS, Springfield, Va. 22151 as EIS-73-0225-F - Price $3.00 printed copy; $1.45 microfiche. February 1972. 17 p, 1 map.

Descriptors: *Beach erosion, *Erosion control, *Coastal engineering, *Delaware, Project planning, Recreation facilities, Berms, Shore protection, Ocean waves, Storms, Tidal effects.
Identifiers: *Broadkill Beach (Del), *Environmental Impact Statements.

The summer resort of Broadkill Beach is located in Sussex County on Delaware Bay about three miles northwest of Lewes, Delaware. The purpose of the proposed project is to protect the shoreline of Broadkill Beach by providing beach erosion control measures that would result in a recreational beach adequate to satisfy the present and future needs of the area. The problem at Broadkill Beach is the erosion of the beach along Delaware Bay caused by wave action during storms. As a result of this erosion, much recreational beach has been lost, and shore properties are now susceptible to damage from extreme tides and wave action. The plan of improvement, considered most suitable for Broadkill Beach consists of improving 4,500 feet of beach, extending from a point 2,700 feet north of the access road (Route 16) to a point 1,800 feet south of that road by placement of approximately 110,000 cubic yards of suitable sand to provide a berm 50 feet wide at an elevation 10 feet above mean low water, erection of 4,500 feet of sand fence and periodic nourishment of the beach by artificial placement of approximately 40,000 cubic yards of suitable sand every four years. Suitable material for initial fill and periodic nourishment is available from an offshore borrow source. (Woodard-USGS)

GENERALIZED DISCHARGE RELATIONS FOR CUTTHROAT FLUMES,
Colorado State Univ., Fort Collins.
G. V. Skogerboe, R. S. Bennett, and W. R. Walker.
J Irrig Drain Div, Am Soc Civ Eng, Vol 98, No IR4, p 569-583, Dec 1972. 11 fig, 2 tab, 5 ref, 2 append.

Descriptors: Irrigation, Open channel flow, *Discharge measurement, *Water measurement, Drainage, Flow measurement, Flumes, Design criteria, Hydraulic structures, Subcritical flow, Laboratory tests, Discharge coefficient, Fluid mechanics.
Identifiers: *Cutthroat flumes, Hydraulics, Measuring instruments, Parshall flumes, Submerged flow, Free flow.

The Cutthroat flume, a new flume designed to measure flows in flat gradient streams, is simple and economical, operates well under submerged flow conditions, and has low head loss. Initial investigations of the flume were limited to one length of 9 ft with throat widths ranging from 1 to 6 ft, and therefore, were not geometrically similar. To obtain generalized discharge rating curves for geometrically similar flumes, a group was rated under both free flow and submerged flow conditions. Twelve flumes were used in the study–3 flumes lenghts, 1.5, 3, and 4 ft, with 4 different throat widths for each length. In addition, the flume sizes were selected to permit correlations with the initial Cutthroat flume studies. To obtain the most accurate rating, based upon analysis of data scatters of laboratory ratings, flumes with throat width to length ratios between 0.1 and 0.4 are recommended. Because of scale effects, flumes less than 3 ft long are satisfactory only for free flow operations. Experimental flume dimensions are given; free flow and submerged flow coefficients and exponents are tabulated. (USBR)

COMPUTER DETERMINATION OF CRITICAL DEPTH CONTROL POINTS IN OPEN CHANNEL FLOW,
Southampton Univ. (England).
K. V. H. Smith.
Inst Civ Eng Proc, Part 2, Vol 53, p 461-470, Dec 1972. 5 fig, 4 ref.

Descriptors: *Open channel flow, Control structures, *Water surface profiles, *Hydraulics, Computer programs, Water control, Discharge (Water), Gradually varied flow, Fluid mechanics, Open channels, Hydraulic structures, Momentum equation, Equations, Foreign research.
Identifiers: Great Britain, Prismatic channels, *Critical depth, Water surface profiles, Calculations, *Critical velocity.

In open channels with variable geometry, or with discharge varying along the length of the channel, determining the location of a critical depth control point is difficult. A simple computer procedure is presented to locate a critical depth control as a point in a channel where a singularity occurs. With the described procedure, control points can be obtained for a wide range of conditions in open channel flow. This procedure is a modern equivalent of the transition profile method applied to prismatic and nonprismatic channels considering lateral inflow. The prismatic channels have a constant cross section with a defined (although not necessarily constant) invert slope. The nonprismatic channels have a variable cross section, including natural channels not having defined inverts. Gradually varied flow equations and conditions for a critical control for both prismatic and nonprismatic channels are discussed. Computer solutions for both kinds of channels are illustrated. Determining a critical depth control point in a nonprismatic outlet channel from a reservoir is exemplified. (USBR)

CHENA RIVER LAKES PROJECT, ALASKA, PROBLEMS RELATING TO CHANNEL DEVELOPMENT, EROSION, AND BANK AND LEVEE PROTECTION,
Committee on Channel Stabilization (Army).
C. P. Lindner, and G. B. Fenwick.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, March 1973. 24 p, 3 pl.

Descriptors: *Channel improvement, *Erosion, *Flood protection, Bank protection, *Levees, Shoals, *Alaska.
Identifiers: *Chena River (Alas), *Tanana River (Alas), Fairbanks (Alas).

This report is published by the Committee on Channel Stabilization primarily in furtherance of their objective, with respect to channel stabilization, to provide, at the request of field offices, advice on design and operational problems; and to review and evaluate pertinent information and disseminate results thereof. Opinions are given on channel stabilization problems involved in evaluating the several alternate plans for regulating the Chena and Tanana Rivers to provide flood protection for Fairbanks, Alaska. Some of the questions asked the Committee, and answered, were: How successfully can the river be diverted by the method outlined; Is location of the diversion satisfactory; How would the diversion affect the river downstream; What levee maintenance problems are likely to be encountered; Is levee design for Tanana River (braided river) the best possible for this type stream; Is there prior experience with levee construction or bank stabilization on large braided rivers; Will borrowing from the river have an effect on future erosion; What problems are associated with maintaining the pilot channel after construction. REFLECTION CHARACTERISTICS OF SCREEN WAVE ABSORBERS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
G. H. Keulegan.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Research Report H-73-3, April 1973. 42 p, 17 tab.

Descriptors: *Hydraulic models, *Screens, Waves (Water).
Identifiers: *Screen wave absorbers, *Wave reflection, *Wave absorbers.

Two expressions are derived for the reflected waves from a wave absorber consisting of small mesh screens with the pieces in parallel arrangement and equal distance apart. In deriving one of the expressions, it is assumed that one part of the

observed reflection is due to a reflection from the frontal part of the absorber and the remaining part, to a reflection from the rigid wall at the back. The agreement between observation and evaluation is fair. The other expression is derived empirically. The formula obtained relates the observed reflection from an absorber to the transmission that would have occurred had the wave absorber been used as a filter. The law derived is quadratic and resembles the form given by Goda and Ippen. (WES)

MATHEMATICAL SIMULATION OF THE TURBIDITY STRUCTURE WITHIN AN IMPOUNDMENT; HYDRAULIC LABORATORY INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
D. G. Fontane, J. P. Bohan, and J. L. Grace, Jr.
U.S. Army Engineer Waterways Experimental Station, Vicksburg, Mississippi, Research Report H-73-2, March 1973. 12 p, 6 tab, 3 pl.

Descriptors: *Mathematical models, *Impoundments, *Turbidity, Computer models, Forecasting, Impoundment, Model studies, Simulation analysis.

The turbidity structure of an impoundment was simulated using a mathematical model capable of simulating physical and chemical characteristics of an impoundment. Turbidity was handled as a conservative chemical substance. The model was used to predict the thermal and turbidity structures of an existing impoundment and was verified with observed data. The model was then used to predict the turbidity structure of a proposed impoundment. The effectiveness of selective withdrawal and, in particular, of a low-level outlet in controlling the turbidity structure of an impoundment was demonstrated. (WES)
W73-12562

WAVE TRANSMISSION THROUGH ROCK STRUCTURES; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulic Lab.
G. H. Keulegan.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Research Report H-73-1, February 1973. 56 p, 22 tab.

Descriptors: *Hydraulic models, *Waves (Water), Breakwaters, Jetties.
Identifiers: *Rock structures, Wave transmission.

Application of the energy method leads to a theoretical expression of the coefficient of transmission through a prismatic structure, constructed from rocks of uniform size, for long waves traversing the structure. When the dissipation in the voids is due partly to turbulent forces, the transmissions are expressed by a power formula. The formula is modified by a parametric factor to respond to the conditions met with in the ordinary model studies of the shorter waves. The factor form is determined from observations made with waves of varying periods. The relation of the adapted formula to the resistance of the structures for steady flow is shown. With the reflections not being amenable to an analytical treatment, test results are consolidated in a single curve, irrespective of the rock sizes, with the porosity remaining constant. (WES)
W73-12563

WAVE DAMPING EFFECTS OF FIBROUS SCREENS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. H. Keulegan.
U. S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Research Report H-72-2, September 1972. 82 p, 18 tab.

Descriptors: *Hydraulic models, *Screens, Waves (Water).
Identifiers: *Wave attenuation, *Fibrous materials.

Expressions are derived for the damping of essentially translatory waves by screens prepared from fibrous materials such as aluminum wool, rubberized hair, and polyurethane foam. The derivations involve either the resistance coefficients or the permeabilities of these materials and these are individually determined. It is found that with the aluminum wool the damping is exponential and yields expressions admitting logarithmic decrements. A comparision is made with the Biesel theory of decay in porous media. With the foams the damping is also exponential; on the other hand, with the rubberized hair the damping is best described in terms of a power formula. (WES)

EFFECTIVE HYDRAULIC ROUGHNESS FOR CHANNELS HAVING BED ROUGHNESS DIFFERENT FROM BANK ROUGHNESS; A STATE-OF-THE-ART REPORT,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
R. G. Cox.
U. S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-73-2, February 1973. 12 p, 2 tab, 9 pl, 3 app.

Descriptors: *Roughness (Hydraulic), *Open channel flow, *Flow resistance, Roughness coefficient, Mannings equation, Beds, Banks, *Reviews.

This report summarizes two numerical studies, one laboratory experimental study, and one analytical study of flow resistance in rectangular channels having one type or degree of boundary roughness on the bed and a second type or degree of roughness on the sidewalls. The numerical study showed that usual procedures for estimating resistance coefficients for channels of this type are not adequate. The laboratory study indicated that the relations between the effective Manning's n, the sidewall Manning's n, the bed Manning's n, and the channel geometry could be established empirically by extensive laboratory testing. The analytical study proved that laboratory studies using a smooth surface for one of its boundaries had little application to practical design problems. It also showed that the best solution to the problem probably would result by use of hydraulic roughness values to describe the boundary surfaces. The study showed that relatively large errors in estimating the hydraulic roughness effect only minor errors in capacity design. (WES)
W73-12565

EFFECTS OF PROPOSED DOCK EXPANSION AT NEWPORT NEWS ON TIDES, CURRENTS, AND SHOALING; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulic Lab.
R. A. Boland, Jr.
Sponsored by Newport News Shipbuilding and Dry Dock Company, Newport News, Virginia. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-72-10, August 1972. 9 p, 3 tab, 13 photo, 9 pl.

Descriptors: Currents (Water), *Docks, *Hydraulic models, *Shoals, *Tides, *Virginia.
Identifiers: *Navigation channels, *Newport News, James River.

The existing comprehensive fixed-bed model of James River was used for tests to determine effects of first and second phases of proposed shipyard expansion of Newport News Shipbuilding and Dry Dock Company facilities on tides, currents, and adjacent ship channel shoaling. Test results consist of comparable measurements of tide heights, current velocities, and shoaling quantities for existing and proposed conditions. Analysis of results of tests led to conclusions that proposed expansion at Newport News would have no significant effects on current velocities or tidal heights. Maximum increases in current velocities caused by proposed expansion occurred in and adjacent to the navigation channel at bottom depth at sta 2A and 2 where ebb current strengths were increased from about 1.0 to 2.0 fps. Current directions in adjacent reach of James River navigation channel should be improved somewhat after completing the second phase. Shoaling rates in areas adjacent to the dock showed increases ranging from 1.5 to 2.5 times the rates with base conditions installed, with maximum shoaling rate occurring with plan 2 installed. However, quantities involved are small and indicated increases should not be considered a significant deterrent to proposed expansion. (WES)
W73-12566

SEA-LAND NAVIGATION STUDIES; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
W. H. Bobb.
Sponsored by Sea-Land Service, Inc., and Port of New York Authority. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-72-9, August 1972. 14 p, 4 tab, 1 photo, 5 pl, 1 app.

Descriptors: *Hydraulic models, Dredging, *New York.
Identifiers: *Containerships, *Navigation channels, Newark Bay (NY) Kill Van Kull (NY), Arthur Kill (NY), *Ship models.

A fixed-bed undistorted-scale model of a portion of Newark Bay, Kill Van Kull, and Arthur Kill and a remotely controlled model of Sea-Land's new SL-7 containership were constructed to a scale of 1:100 and used to determine the adequacy of proposed dredging to provide docking and maneuvering areas to familiarize prospective captains and pilots with the handling characteristics of the new type ship. The Sea-Land model was equipped to reproduce steady state flows in flood or ebb directions and an erratic wind field from three directions. The SL-7 required major portion of the channel in Kill Van Kull and all of it in Newark Bay. Addition of the wind field greatly increased difficulties in rounding Bergen Point, passing through the bridge span, and approaching the Sea-Land wharf. Results of tests in New York Harbor model indicate that shoaling in presently maintained areas south of the bridge will be reduced when the maneuvering area is dredged, but shoaling in the maneuvering area and adjacent channel areas will be greatly increased. None of the plans tested had any significant effect on hydraulic conditions in the problem areas. (WES)
W73-12567

OUTLET WORKS STILLING BASIN FOR TALLAHALA DAM, TALLAHALA CREEK, MISSISSIPPI; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
N.R. Oswalt.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-73-5, April 1973. 8 p , 1 tab, 4 photo, 5 pl.

Descriptors: *Eddies, *Hydraulic models, *Outlet works, Flow, *Mississippi.
Identifiers: *Tallahala Dam (Miss), *Stilling basins.

Tests were conducted on 1:16.6-scale model of Tallahala Creek outlet works stilling basin to determine if eddies or other undesirable flow conditions would exist in the stilling basin. Basin consisted of a horizontal apron 90 ft long and 22 ft wide and was connected to 10-ft-diam outlet by a 56-ft-long transition with sidewalls flared 8.67 on 1. Eddies occurred in original design basin with discharges of 800 cfs or less and expected tailwater elevations. Eddies were eliminated by revising floor and walls of flared transition. Sidewall flare was changed from 8.67 on 1 to 11.83 on 1 and the IV-on-8H downsloping floor was changed to IV-on-6H upslope for a rise of 4 ft and then a downslope with curve following equation x2 ± 238y. Floor was sloped down laterally 1 ft from transition center line to each wall. Spray off baffle blocks occurred with design discharge and minimum tailwater with stilling basin as originally designed. Height of baffle blocks was increased and additional row of blocks was added to prevent this type of action. (WES)

SHOALING CONDITIONS, ST. LOUIS HARBOR, MISSISSIPPI RIVER; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. J. Franco.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-72-7, November 1972. 18 p, 17 pl.

Descriptors: *Shoals, *Harbors, *Hydraulic models, Mississippi River, Sediment transport, *Missouri.
Identifiers: *Chain of Rocks Canal, *St. Lous Harbor (Mo).

Purposes of study were to determine causes of shoaling in harbor and docking areas and to develop plans to eliminate or reduce shoaling in these areas and in lower entrance to Chain of Rocks Canal. Model was a movable-bed type, reproducing reach of Mississippi River and adjacent overbank areas between miles 191.0 and 169.9. Some of the results indicated: Shoaling along city front can be expected along the convex side of bends in streams carrying sediment. Conditions in the city front reach are also affected by movement of sediment from the Missouri River and by differences between channel characteristics in reach along city front and those in reach upstream. Improvement along city front can be obtained by closing channel along left side of Mosenthien Island, by extending training structures into channel on right side of Mosenthien Island and channel along city front, and by constructing a lock and dam structure downstream of the harbor area. Shoaling in lower entrance to Chain of Rocks Canal during low flows is caused by sudden expansion in channel width and movement of bottom currents towards approach channel past the end of the trail dike. EFFECTS OF SUBMERGED SILLS IN THE ST. CLAIR RIVER; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. J. Franco, and J. E. Glover.
U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-72-4, August 1972. 18 p, 5 tab, 7 photo, 20 pl.

Descriptors: *Navigation, *Hydraulic models, Lake Huron, *Michigan.
Identifiers: *Submerged sills, Navigation conditions, *St. Clair River (Mich).

Low lake level experienced in Lake Huron during the early 1960's had a detrimental economic impact on the area. To increase water level in Lake Huron, plans for using submerged sills at the head to St. Clair River were proposed. A fixed-bed, 1:60-scale model was used, reproducing approximately 2.8 miles of St. Clair River and a small section of the lower end of Lake Huron. With the sill arrangements developed, water levels in Lake Huron could be raised by up to 0.75 ft without adversely affecting navigation conditions. A type of sill that would facilitate construction and reduce construction cost could be used without any significant loss in effectiveness. Shoaling along the Canadian shore can be attributed to movement of sediment into that side of the river, the natural tendency for shoaling on the convex side of a river bend, and the effects of the eddy currents. Sills would tend to reduce the size of the eddy and the tendency for shoaling. Some deposition of sediment could occur along the left ends of some of the sills, but any of effectiveness resulting from deposition would be small. (WES)

ESTUARINE NAVIGATION PROJECTS.
Committee on Tidal Hydraulics (Army), Washington, D.C.

Available from NTIS, Springfield, Va. 22151 as AD-756 133, Price $3.00 printed copy; $1.45 microfiche. Technical Bulletin No 17, January 1971. 253 p, 57 plates.

Descriptors: *Navigation, *Tidal waters, *Hydraulic engineering, *Projects, *Inland waterways, United States, Federal Government, Estuaries, Bays, Canals, Dredging, Tidal effects, Currents (Water), Saline water intrusion, Sediment transport, Channel improvement, Harbors, Project purposes, Programs, Reviews, Hydraulic design.
Identifiers: *Estuarine navigation projects (USA), Shoaling.

Information is presented on selected navigation projects in tidal waterways such as inlets, bays, tidal rivers, and canals. Included for each of the projects are description of the waterway and the Federal project, data on the tides, freshwater discharges from upland sources, currents, salinity intrusions, shoaling, and the dredging required to maintain the channels. Specific problems are identified (where applicable) together with statements of the status of solutions of the problems. Available reference sources are listed. The information should have value in the planning, design, and maintenance of projects in waterways having similar characteristics. The order of presentation of the selected projects is clockwise around continental United States, beginning in New England; in addition, one project in Alaska and one in Hawaii are included. (Woodard-USGS)

GRAYS HARBOR ESTUARY, WASHINGTON: REPORT 2. NORTH JETTY STUDY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. J. Brogdon, Jr.
Available from NTIS, Springfield, Va 22151, as AD-748 813 Price $3.00 printed copy; $1.45 microfiche. Technical Report H-72-2, September 1972. 148 p, 2 fig, 122 plate, 5 photo, 4 tab, 1 ref.

Descriptors: *Coastal engineering, *Beach erosion, *Estuaries, *Jetties, *Washington, Harbors, Shore protection, Model studies, Ocean currents, Waves (Water), Tidal effects, Shoals, Sediment transport, Sands, Saline water intrusion, Forecasting, Planning, Evaluation, Navigation, Inlets (Waterways), Hydraulics, Flow characteristics.
Identifiers: *Grays Harbor Estuary (Wash).

This report is the second in a series to be published on the results of model tests on the Grays Harbor estuary, Washington, model conducted for the U.S. Army Engineer District, Seattle. The entrance to Grays Harbor is protected by two converging stone jetties that are about 1.23 miles apart at their outer ends. Between 1907 and 1914, the north jetty was constructed seaward from Point Brown for a distance of about 3.22 miles. The original top elevation was 8.0 ft mean lower low water (mllw). By 1933, the outer 7000 ft had deteriorated to mllw or lower. Between 1940 and 1942, the jetty was rehabilitated to within 850 ft of the original outer end with a top elevation of 16.0 ft mllw. By 1967 the outer 600 ft of the rehabilitated jetty was below mllw. The fixed-bed model of the Grays Harbor estuary was used to determine the effects of several plans for rehabilitation of the north jetty. Determinations were made of effects on hydraulic, salinity, shoaling, and dye dispersion characteristics. Test results consist of current velocity, tidal height, and salinity measurements; shoaling patterns in the entrance area; dye dispersion characteristics; and photographs of surface current patterns. A 650-ft extension to the north jetty would cause only insignificant local changes in current velocities and patterns in the entrance area. (Woodard-USGS)

MAINTENANCE OF THE HUDSON RIVER CHANNEL, NEW YORK, NAVIGATION PROJECT, (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, New York.

Available from NTIS, Springfield, Va. 22151, as EIS-NY-73-007-F; $3.50 printed copy; $1.45 microfiche. June 30, 1972. 12 p.

Descriptors: *Channel improvement, *Dredging, *Navigation, *Projects, *Hudson River, New York, New Jersey, Maintenance, Engineering, Environmental effects, Turbidity, Water quality, Ecology, Water pollution control, Reviews.
Identifiers: *Hudson River Channel, Spoil disposal, *Environmental Impact Statements.

The Hudson River Channel, New York, Navigation Project includes several phases that deal with environmental, economic, social, and safety aspects. Maintenance dredging of the Hudson River Channel is an existing Federal navigation project. The cahnnel is located in the Hudson River between New Jersey and New York City. The project was authorized by the River and Harbor Acts. It provides for: a channel 45 ft deep and 2,000 ft wide in the area of the Upper New York Bay to W. 40th Street, Manhattan, and 48 ft deep and 2,000 ft wide to 59th Street for a total length of approximately 6 miles; a channel, 40 ft deep for the full width of the river, extending from deep water in Upper New York Bay off Ellis Island to W. 59th Street, Manhattan, for a length of approximately 6 miles; and a channel, 30 ft deep, 750 ft wide, along the Weehawkin-Edgewater waterfront, for a length of 5 miles. (Woodard-USGS)

CONTROL OF UNDERSEEPAGE BY RELIEF WELLS, TROTTERS, MISSISSIPPI; APPENDIX K: 1969 PUMPING TESTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. C. Trahan.
Available from NTIS, Springfield, Va. 22151 as AD-756 208 - Price $3.00 printed copy; $1.45 microfiche. Technical Memorandum No 3-341, September 1970. 31 p, 5 fig, 8 plate, 3 tab.

Descriptors: *Seepage control, *Levees, *Mississippi River, *Underseepage, *Wells, Dewatering, Pumping, Water yield, Aquifers, Well data, Drawdown, Data collections, Hydrologic data, Engineering.

Identifiers: *Trotters (Miss), Relief wells.

The experimental relief well system installed in 1950 along the landside tow of the Mississippi River main line levee on the east bank at Trotters, Miss, (levee mile 54), is described in the main report to which this is an appendix. The well system was installed in order that information on the performance of relief wells over an extended period of time could be obtained. The relief well system consists of thirty 6-inch ID, wooden wells, on 50-ft centers, located parallel to, and 387 ft landward of the levee center line (just landward of the tow of the seepage berm). The well screens penetrate about 50% of the aquifer thickness and are surrounded by 6-inch-thick gravel filters. This report (Appendix K) presents well cleaning operations and pumping tests conducted in 1969. The well pumping test data were analyzed in order that the yields of the pump-tested wells could be compared with those obtained after installation. Photographs of well screens obtained in 1969 with the borehole TV camera are included for several selected wells. The specific yields for the 1950 pumping tests and all subsequent tests are tabulated. (Woodard-USGS)

SIMPLIFIED SOLUTION FOR DECREASING FLOW IN WELLS,
California Univ., Davis. Dept. of Irrigation.
G. Aron, and V. H. Scott.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 5, No HY5, p 1-12, September 1965. 8 fig, 2 tab, 5 ref, append.

Descriptors: *Aquifer charastics, *Hydraulics, Wells, *Mathematical studies.
Identifiers: Mathematical models, Mineral content, Piezometric surface.

The development of truly exact formulas or methods to describe the hydraulics of nonsteady groundwater flow is an extremely complex task. Even in the most sophisticated approaches, factors such as heterogeneity of the aquifer material, effect of mineral content on permeability, and lag in the response of piezometers to changes of the piezometric surface are neglected or highly simplified. Mathematical methods are used to demonstrate that even if the discharge, Q, from a well decreases with time, the drawdown h, at any time and at any distance from the well can be expressed by Jacob's formula. The proposed procedure should not result in an error of more than 5% to 10% in the computation of transmissability or drawdown, or 20% to 30% in the computation of the storage coefficient. MICELLAR SOLUTIONS STIMULATE WELLS,
Amoco Production Co., Tulsa, Okla.
D. L. Dauben, and H. R. Froning.
Oil and Gas Journal, Vol 70, No 38, p 72-78, 83, September 1972. 6 fig, 3 tab, 3 ref, append.

Descriptors: Wells, *Oil wells, *Injection wells, Chemical reactions, Oil industry, *Water chemistry, *Surfacants.
Identifiers: *Well stimulation, Well redevelopment, *Fluid-flow rates, Thermodynamic equilibrium.

Micellar solution treatment of selected injection and production wells can improve fluid-flow rates by removing residual oil saturations, organic deposits, trapped water or emulsions from the vicinity of the well bore. Micellar solutions (also called microemulsions) are composed of a hydrocarbon, water, a surfacent and a cosurfacant. The surfacent and cosurfacent act as coupling agents to solubilize two otherwise immiscible liquids by encapsulating either water into oil or oil into water. Those solutions are homogeneous and single phase in appearance and displacing ability. Properly mixed they exhibit good miscibility with various crude oils and with water, low and high temperature stability, and an acceptable tolerance to salt (NaCl) content variations. Careful selection of the wells to be treated, consideration of the mixture to be used with respect to the intended purpose, volumes injected, and injection procedures are critical to treatment success. Key factors for the design, application and evaluation of micellar treatment are described. (Hunt-NWWA)

DIAMOND-BIT RESEARCH PROVIDES BASIC DRILLING PARAMETERS,
Mobil Research and Development Corp., Dallas, Tex.
T. B. Dellinger, and B. J. Livesay.
Oil and Gas Journal, Vol 70, No 38, p 86-90, 95, September 1972. 6 fig, 22 ref.

Descriptors: Drilling, *Well drilling, Wells, Rotary drilling, Drilling equipment, Analytical techniques, Computers, Hydraulics, *Regression analysis.
Identifiers: *Diamond drill bits, *Hydraulic lift, *Fluid velocity.

Diamond-bit drilling has developed through the years with very little technical or theoretical guidance. Although mining-type diamond coring can be traced back to 1862, oil field-type operations didn't begin until 1921. Since there was little knowledge of the relationships between factors controlling the drilling characteristics of diamond bits, a study was performed to supply some of these relationships. A comprehensive examination is presented of the fundamental relationships of penetration rate, bit weight, rotary speed, torque and flow rate, and hydraulic lift. Formulae are presented to relate penetration rate to various combinations of variables. (Hunt-NWWA)

S. P. Garg, and J. Lal.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 97A, No IR1, p 131-147, March 1971. 10 fig, 7 ref, 2 append.

Descriptors: *Aquifer characteristics, Permeability, *Hydraulics, Wells, Equipment, *Well screens, Design flow.
Identifiers: *Mathematical analysis, *Entrance velocity, Piezometric heads.

Optimum and economical utilization of ground water involves determination of the depth to which the hole should be bored, selection of a suitable well screen with or without gravel pack, and selection of a suitable pumping unit. While the techniques for boring a well have improved considerably and better screens, as well as pumps have evolved, the progress of improvements in well screen design to conform with the aquifer has been slow. The design of a well which involves the determination of the correct screen size, its length, number and character of openings is still based on empirical criteria. An analytical and experimental study of well screen behavior is presented. General equations describing the hydraulics of well screens are presented in which aquifer permeability, well-screen friction, and other factors have been considered. These equations agree with experimental results and criteria for the design of well screens are presented. (Hunt-NWWA)

BACK-SURGE TECHNIQUE IMPROVES WELL COMPLETIONS,
R. E. Snyder.
World Oil, Vol 172, No 1, p 72-73, January 1971. 2 fig.

Descriptors: *Wells, Oil wells, Oil industry, Aquifer characteristics, *Flow characteristics, Hydraulics.
Identifiers: *Well development, Epoxy injection, *Controlled pressure surge.

Shell Oil Co. has improved productivity on well completions and increased workover success with new tools and methods which are designed to give a controlled pressure surge into the well from the formation to remove perforation restrictions and plugging. The basic goal is to provide the cleanest possible avenue between the well bore and the formation to enlarge the effective wellbore for maximum natural flow, clean all perforations to more effectively inject sand consolidation chemicals or efficiently distribute gravel packing material, open all perforations to acid stimulation, without fracture treatment, to expose entire pay zone. The back surge methods and tools discussed have improved consolidation jobs by assuring open perforations, and thereby reducing epoxy injection pressures, and allowing proper mechanical gravel packing. AN ELECTRIC CONVERSION FOR MECHANICAL HYDRAULIC GOVERNORS OF WATER WHEEL TURBINES,
Bureau of Reclamation, Denver, Colo.
C. L. Clemans.
Rep REC-ERC-72-29, Sept 1972. 27 p, 19 fig, 3 ref, append.

Descriptors: *Governors, Mechanical equipment, Performance, Control, Velocity, Research and development, *Hydraulic turbines, Coordination, *Electronic equipment, Power system operations, Testing procedures, On-site tests.
Identifiers: *Synchronous machines, Power system stability, Interconnected systems, Sensitivity, Control equipment, Circuits.

A conversion system for upgrading performance of conventional mechanical governors for hydraulic turbines has been developed. The conversion retains the proven long-term stability of the ball head speed reference but replaces the dashpot function with derivative terms from an independent frequency sensor. The result upgrades the governor system from temporary droop type to a higher order derivative-proportional-integral type. Installation is simple. All original mechanical apparatus is retained for startup and standby; control can be transferred instantly. Advantages are higher sensitivity to small system speed deviations and faster, smoother response to system load control. (USBR)

Inst Eng, Aust, Mech Chem Eng Trans, Vol MC8, No 1, p 37-43 May 1972. 7 fig, 1 ref, disc.

Descriptors: *Hydraulic gates, *Hydraulic valves, Hydraulic machinery, Hydraulic design, Automatic control, Gate hoists, Evaluation, Construction materials, Performance, Installation, Spillway gates, Radial gates, Butterfy valves, Stainless steel, Operation and maintenance, Reviews, *Hoisting machinery, *Australia.
Identifiers: Snowy Mountains Scheme (Australia), Policies, Foreign construction.

Hydraulic gates and valves constitute the basic control elements and are a prominent feature of the Snowy Mountain Scheme, which has been put into operation over the past 20 yrs. The general policies are reviewed and the effectiveness of the philosophies used are assessed. Gates and valves used in the main hydraulic systems of the scheme are listed. Trends in application of spillway gates, butterfly valves, gate hoists, and automatic gates are discussed. Records of serious malfunctions that have occurred, observations on significant developments in materials and on general trends during construction of the scheme are given. The successful construction and operation of the scheme suggests that sound practives have been used, and the experience gained has received recognition in Australia and other countries. (USBR)

ENERGY METHOD FOR COMPUTING THE AMPLITUDE OF VIBRATION OF CONDUCTOR BUNDLES DUE TO WAKE EFFECT,
Politecnico di Milano (Italy). Istituto di Meccanica Applicata.
G. Diana, and M. Gasparetto.
Eneg Elettr, Vol 49, No 8, p 532-539, Aug 1972. 10 fig, 7 ref.

Descriptors: *Transmission lines, Wind velocity, *Bundled conductors, Frequency, *Energy, Analytical techniques, Foreign research, Computer programs, Flow around objects.
Identifiers: Aerodynamic forces, Italy, *Vibration (Aeolian), *Wind (Meteorology), Amplitude, Electric conductors, Wakes, Galloping conductors, Harmonies, Motion, Computation, Mathematical analysis.

The phenomenon responsible for large amplitude vibrations in bundled conductors of transmission lines is described. A method is developed for computing energy introduced by the wind when a cylinder is moving in a wake of another cylinder. From previous studies, a deduction was made that the phenomenon is characterized by an elliptical motion of the cylinder in the wake, though a mathematical model to explain this type of motion is difficult to determine. Starting with this elliptical motion concept, aerodynamic forces acting on the cylinder were computed. Knowing the energy introduced by the wind, the amplitudes of vibrations caused by the wake effect in bundled conductors can be computed. Results indicate: (1) the energy is primarily introduced by a drag variation and the lift has a negligible effect; and (2) the energy introduced in a cylinder vibrating in a wake of another cylinder is perceptible only at very low frequencies, this justifying low frequency vibration occurring in a bundled conductor system. (USBR)

GUIDE FOR THE DESIGN OF ALUMINUM TRANSMISSION TOWERS.
American Society of Civil Engineers, New York. Task Committee on Lightweight Alloys.

J Struct Div, Am Soc Civ Eng, Vol 98, No ST12, p 2785-2801, Dec 1972. 2 fig, 2 tab, 11 ref, 3 append.

Descriptors: Structural engineering, Loads (Forces), Aluminum alloys, *Transmission towers, Aluminum, Towers, *Structural design, Stress, Buckling, Shear, Mechanical properties, Design criteria, Structural members, On-site tests.
Identifiers: *Aluminum towers, Fasteners, Torsion, Ultimate loads, Bolted joints, Fabrication, Bolts.

The ASCE Task Committee on Lightweight Alloys has prepared a guide for designing transmission towers for all voltage levels, constructed from aluminum alloy 6061-T6. Loading or overload factors, clearances or other electrical requirements, suitability of tower configuration or type, guys, footings, or anchors, are not discussed, as these are considered to be outside the scope of this guide. Analysis of the tower, subjected to the desired combination of ultimate loads, for the forces and, moments in the parts of the tower, is presupposed and suitable sizes of members and fasteners to carry these ultimate loads are established. Fabrication is discussed sufficiently to ensure realization of the designer's intentions. Test methods are discussed only to ensure validity of the tests. All designs are subject to the final scrutiny of full-scale tower tests. The guide should be considered as a means of designing a tower that will sustain specified ultimate loads without significant permanent deformation. (USBR)

TURBINE DESIGN AND PERFORMANCE FOR THE MERSEY-FORTH HYDRO POWER DEVELOPMENT,
Hydro-Electric Commission, Tasmania.
G. J. Causo .
Inst Eng, Aust, Mech Chem Eng Trans, Vol MC8, No 1, p 31-36, May 1972. 11 fig, 2 tab, 9 ref.

Descriptors: *Hydraulic turbines, Draft tubes, Hydraulic machinery, Francis turbines, Pelton turbines, Prototype tests, Foreign projects, Water hammer, *Guarantees, Governors, Prototype tests, *Australia, *Model studies.
Identifiers: Tasmania (Australia), Turbine efficiency, Load rejection, *Performance tests, Spiral cases, Kapla turbines, Water column separation, Acceptance tests.

The Mersey-Forth Hydroelectric development in Northern Tasmania comprises 7 single unit power stations, with a total installed capacity of 308 mw. Four aspects of turbine design and performance discussed are: (1) use of models as the basis for performance guarantees and the allied control of prototype similarity; (2) elimination of conventional governor on a turbine with long tunnel and penstock system; (3) use of a spiral case having unusually small dimensions for a Kaplan turbine and resulting advantages; (4) use of air to avoid adverse effects from water column separation on a turbine with a long pressure tailrace. Model and prototype tests are presented. Regardless of turbine manufacture, all power stations are equipped with ASEA/KMW electrohydraulic governors, simplifying maintenance and permitting adaptation of centralized control. (USBR)

VERTICAL DYNAMIC RESPONSE OF EMBEDED FOOTINGS,
Bureau of Reclamation, Denver Colo.
D. A. Tiedemann.
Report REC-ERC-72-34, Sep 1972. 22 p, 20 fig, 3 tab, 26 ref.

Descriptors: *Seismic Studies, Foundation investigations, Soil investigations, *Seismic properties, *Soil dynamics, Resonance, Soil physical properties, Foundations, Towers, Bibliographies.
Identifiers: Resonant column test, Pacific Northwest-Southwest Intertie, Fort Thompson-Grand Isld Trans Line, Anchored footings, In situ test, Auger-type footings, Vibrators (Mechanical), Pressed plate footings, Dynamic tests, Belled footings, Natural frequency, Footings, Damping.

Field tests were conducted with vibrators on prototype embeded transmission tower footings in 2 different soils to determine their vertical mode dynamic response characteristics. One test was on a belled-auger footing in a soft, saturated clay. The remaining tests were on anchor bar, screw auger, and single- and double-pressed plate footings in low-density dune sand. Also, in situ wave velocity measurements and laboratory resonant column tests were conducted to determine dynamic properties of the soils. Response curves obtained for the belled-auger footing were compared with responses calculated using the half-space theory and the lumped parameter method. Results obtained using the half-space theory differed considerably from measured values. Lumped parameter results indicated that the method was applicable; however, additional testing is needed to further define the effects of embedment on the mass, spring, and damping constants. Dynamic properties of the dune sand determined by in situ velocity measurements, resonant column tests, and empirical relationships were in very close agreement. (USBR)

H. G. Poulos, J. R. Booker, and G. J. Ring.
Soil Found, Vol 12, No 4, p 1-17, Dec 1972. 18 fig, 1 tab, 5 ref, append.

Descriptors: *Settlement (Structural), *Elastic deformation, Graphical analysis, Structural behavior, *Embankment, *Earth dams, Deformation, Elastic theory, *Rockfill dams, Stress analysis, Consolidation, Soil pressure, Soil mechanics, Dam construction.
Identifiers: *Vertical displacements, *Horizontal displacements, Foreign studies, Horizontal movement, Calculations, Displacements, Finite element method.

A simple method is described for obtaining the observed displacements in an embankment or earth dam during the following incremental construction. The method calculations horizontal and vertical displacements and stresses by obtaining coefficients from graphs and using these coefficients in equations. Knowledge of the deformation performance of embankments is important in determining whether future performance will be satisfactory. Several solutions are presented for the displacements and stresses within a homogeneous embankment resting on a rough rigid base, and application of these solutions to practical problems involving nonhomogeneous embankments and consolidation movements is discussed. For a rockfill embankment, comparisons of predicted settlements, observed values, and values predicted from a finite element analysis suggest that the proposed simple method is useful for obtaining rapid estimates of embankment deformations. BEARING CAPACITY OF FOOTINGS IN PLANE STRAIN,
Colorado Univ., Boulder.
H-Y, Ko, and L. W. Davidson.
J Soil Mech Found Div, Am Soc Civ Eng, Vol 99, No SM1, p 1-23, Jan 1973. 10 fig, 4 tab, 28 ref, 2 append.

Descriptors: *Foundation bearing tests, Laboratory tests, Foundation failure, Soil mechanics, Theoretical analysis, Bearing strength, Foundations, Bibliographies.
Identifiers: *Continuous footings, Plane strain, Foundation models, *Bearing capacity, *Footings, Sands, Roughness, Smoothness, Bearing pressure, Internal friction, Ultimate loads, Test results, Comparative studies, Loading tests.

An experimental program to study plane strain bearing capacities of model strip footings on dense sand is described. The model footings tested (1) were either 3 by 4 in. or 6 by 4 in. in plan (test box was 4 in. wide) and (2) had a smooth (glass) or rough (sandpaper) base. Test results showed plane strain conditions must be maintained in the test box, as deflections of the walls can cause a significant reduction in the ultimate bearing capacity and can allow lodging of sand grains between the footing and walls. Results also show that ultimate bearing capacities for rough footings are only 10% higher than those for smooth footings; thus, Meyerhof's recommendation that 1/2 (N sub gamma) be used for smooth footings is not substantiated. Sokolvski's method of solving the plasticity problem, as illustrated through the scaling procedure developed by Ko and Scott, produces the most accurate estimate of smooth footing bearing values and appears to give a slightly conservative estimate of rough footing bearing values. Use of internal friction angles calculated from triaxial tests as compared to plane strain tests is also discussed. (USBR)

8E. Rock Mechanics and Geology

EVALUATION OF HYDRAULIC PROPERTIES OF ROCK MASSES INFLUENCED BY MAJOR HETEROGENEITIES,
Golder, Brawner and Associates Ltd., Vancouver (British Columbia).
J. C. Sharp, Y. N. T. Maini, and T. L. Krekke.
Paper, 14th Symp Rock Mech, Penn State Univ, University Park, June 1972. 21 p, 9 fig, 10 ref.

Descriptors: *Heterogeneity, *Tunnel construction, *Faults (Geologic), Engineering geology, Groundwater movement, *Variability, *Hydraulic properties, Foundation investigations, Hydraulic conductivity, Tunnels, Seepage, Tunneling, Excavation, Slope stability, Piezometers, Rock mechanics, Base flow, Hydrogeology.
Identifiers: Hydraulic pressure tests, *Rock slope stability, In situ tests, Permeability tests.

Natural geologic processes generally cause heterogeneities (faults, sedimentary layers, and solution channels) in rock masses that can have a major influence on ground-water flow if the heterogeneities are continuous. Heterogeneities can be either permeable (water carrier) or impermeable (water barrier) relative to the rock mass and can be helpful or hazardous relative to slope stability, foundation, and tunneling situations. For slope stability under drawdown conditions, an impermeable clay seam running parallel to the slope can prevent ground-water pressures from dissipating, and lead to failure. In excavations and tunnels, permeable faults can allow costly water inflows, whereas, water trapped behind an impermeable fault or seam can burst suddenly into an excavation. In predicting the influence of heterogeneities, their areal extent and hydraulic conductivity relative to the surrounding rock are needed. A tunnel construction example is presented wherein an impermeable fault with a 250-ft head acting upon it was detected by piezometer measurements. A differential pressure test to evaluate expected flow across a fault is described. (USBR)

STRESS DISTRIBUTION AROUND A TUNNEL SITUATED IN A LAYER UNDER THE ACTION OF GRAVITY,
National Technical Univ., Athens (Greece).
P. S. Theocaris, and E. Koroneos.
Rock Mechanics, Vol 4, No 3, p 140-154, Nov 1972. 10 fig, 17 ref.

Descriptors: *Tunnels, *Tunnel pressures, Rock mechanics, Gravity, Stress, Stress analysis, *Tunnel design, Foreign research, Bibliographies, Elastic deformation, Strain, Laboratory tests, Model studies, Testing procedures.
Identifiers: Moire pattern, Greece, Experimental models, *Stress distribution, Displacement, Rock pressures, Test results, Underground openings.

A laboratory investigation determined the stress distribution around a circular tunnel caused by the forces of gravity. Tests were made on a model of a strongly plasticized epoxy polymer. Deformation of the 1- by 14- by 31-cm model was achieved by the inversion method, in which the model was freely suspended from the one extremity and left to deform by its own weight. The model simulated a circular tunnel surrounded by a narrow vertical layer loosely connected with neighboring layers. The projected image Moire method was used for measuring displacements. From the displacement, strains and stresses were calculated. Conclusions are that: (1) the stress field distrubance caused by the tunnel opening extends outward for 2 tunnel diameters; (2) maximum normal stresses appear at the springlines, invert, and crown of the tunnel; (3) tangential stress at the walls can increase to 3 times the value for the corresponding layer with no tunnel opening; (4) the tunnel has a strong influence on shear stresses; and (5) actual stress distribution around tunnels should be thoroughly examined. WELL LOGS CAN INDICATE FORMATION DRILLABILITY,
California Univ., Berkeley.
W. H. Somerton, and S. El-Hadidi.
World Oil, Vol 173, No 7, p 55-56, December 1971. 1 fig, 16 ref.

Descriptors: *Wells, *Well drilling, Borehole geophysics, Core logging, *Logging, Lithologic logs.
Identifiers: *Sonic transit time log, Sonic velocity, *Rock drillability.

Recent studies of well logs indicated that the resistance of rock to drilling can be determined from sonic transit times and a companion log that provides mineralogical information about the formation being penetrated. A relationship between penetration rate and lithology logs is conspicuous. Correlation between rate of penetration and logs showing variations in physical properties is impossible without accounting for drilling condition variations. Presented are two formulae for relating drilling strength to standard drilling variables so that a correlation between log data and drillability can be established. (Hunt-NWWA)

8F. Concrete

TESTS OF SELECTED INSULATING MATERIALS FOR MASS CONCRETE,
Army Engineer, Waterways Experiment Station, Vicksburg, Miss.
E. C. Roshore, and H. T. Thornton, Jr.
Available from NTIS, Springfield, Va 22151 as AD-756 113 Price $3.00 printed copy; $1.45 microfiche. Technical Report C-70-4, September 1970. 19 p, 1 fig, 4 tab, 2 ref.

Descriptors: *Engineering structures, *Structural analysis, *Concrete testing, *Thermal expansion, *Thermal insulation, Laboratory tests, Temperature, Winds, Moisture, Weathering, Evaluation, Design criteria.

During the early ages of mass concrete construction, the interior of the concrete mass can be at temperatures well above freezing while the bulkhead and lift surfaces are being subjected to sub-

freezing temperatures. This condition can result in thermal cracking of the concrete in mass structures. Various types of materials were investigated for insulating mass concrete. The physical and thermal properties of the selected materials were determined under a variety of conditions in the laboratory. The overall heat-transfer characteristics of the materials were determined by using them to insulate standard 2-ft concrete cubes under different temperature, wind velocity, and moisture conditions in the laboratory. Thermal gradient data were developed using both insulated and uninsulated cubes. Outdoor weathering tests were conducted and the insulating properties of several of the materials was tested under field conditions on rough horizonatal and vertical surfaces. Only one of the materials tested is considered satisfactory for the long-term field insulation of mass concrete structures; four materials are considered satisfactory for short-term insulation (15 to 20 days) in the field; two of the materials are not considered satisfactory for either short- or long-term field use. The foamed-in-place insulating material adheres satisfactorily to both horizontal and vertical concrete surfaces under both wet and dry conditions and can be removed without great difficulty. However, this type of material has a pressure buildup in vertical forms caused by self-restriction of upward movement of the foam. (Woodard-USGS)

LEACHING OF CEMENT FROM A CONCRETE PILE SECTION BY GROUNDWATER FLOW,
Cementation Co. Ltd., London (England).
J. W. Farmer.
Civil Engineering and Public Works Review, Vol 64, No 745, p 457-458, May 1969. 4 fig, 2 tab, 3 ref.

Descriptors: Aquifer characteristics, Permeability, *Cement, Hydraulics, *Subsurface drainage, *Groundwater movement, Porosity.
Identifiers: *Critical erosion velocity, Velocity of seepage flow, *Pore space, Hydraulic gradients.

Inspection of cast in situ bored piles has revealed bands of concrete containing honeycombed areas which have been attributed to leaching of cement from the fresh concrete by ground water flow. Two types of groundwater flow are normally encountered in piling works in permeable ground: sub-horizontal flow due to hydraulic gradients, and near vertical flow due to tidal movement in costal works. In the former case it is possible to visualize relatively high rates of flow with correspondingly high seepage velocities, which could induce surface leaching if velocities exceed 5 cm/sec. In the latter case, maximum seepage velocities are of a low magnitude (1 to 2 feet/hr) which is insufficient to cause leaching from a well graded, correctly placed, fluid state concrete. A laboratory experiment to determine degree of leaching at project site velocities is presented. (Smith-NWWA)

WELDING OF A NORMALIZED HIGH STRENGTH LOW ALLOY PLATE STEEL OF STRUCTURAL QUALITY,
United States Steel Corp., Monroeville, Pa. Applied Research Lab.
W. P. Benter, Jr.
Weld J, Vol 51, No 12, p 591-s-598-s, Dec 1972. 11 fig, 10 tab, 2 ref.

Descriptors: *Welding, *Welded joints, *Structural steel, *High strength steels, Evaluation, Tensile strength, Testing procedures.
Identifiers: Bend tests, Crack propagation, Weldments, Arc welding, Electroslag welding, *Butt joints, Notch tests, Tensile properties, *Low alloy steels, Impact tests, Hardness tests, Tension tests.

Normalized high-strength low-alloy steels are being used to provide structural quality plate steels with improved low-temperature notch toughness for welding applications. Welding characteristics of one such steel are discussed. The investigation covers evaluation of butt welds made by shielded metal-arc, submerged arc, tandem submerged arc, electrogas, and electroslag processes, and includes data on tension tests, guided bend tests, Charpy V-notch tests (base metal, weld metal, and heat-affected zone), and explosion-bulge tests. This steel can be satisfactorily welded with all these processes by using commercially available filler metals, fluxes, and gases, provided low-hydrogen practices are followed. All processes produce butt joints with 100% joint efficiency and satisfactory bend-test ductility. The notch toughness of the weld metal and heat-affected zone, as measured by Charpy V-notch tests and confirmed by explosion-bulge tests of shielded metal-arc, submerged arc, and tandem submerged arc weldments, is excellent. The higher heat input electrogas and electroslag welding processes showed a deterioration of Charpy V-notch properties in the heat-affected zone to the level that would be expected in hot rolled steels of this type. HIGH STRENGTH BOLTED GALVANIZED JOINTS,
Carleton Univ., Ottawa (Ontario).
D. J. L. Kennedy.
J Struct Div, Am Soc Civ Eng, Vol 98, No ST12, p 2723-2738, Dec 1972. 14 fig, 5 tab, 8 ref, append.

Descriptors: High strength steel, *Joints (Connections), Steel, *Structural steel, Mechanical properties, *Ductility, Foreign research, Failure (Mechanics), Corrosion control, *Steel structures, Protective coatings, Bolts.
Identifiers: *High strength bolts, Galvanized steel, *Bolted joints, Galvanizing, Test results, Stress concentration, Friction coefficient (Mechanical), Fatigue tests, Brittleness, Bolts.

High-strength bolts are the chief mechanical fasteners used for making field connections in steel construction. Behavior of hot dip galvanized high-strength bolted joints under repeated load is discussed. Tests on steel plates without apparent stress concentrations show that hot dip galvanizing reduces the fatigue strength about 4% in zero-to-tension cycles. Galvanizing, in the presence of a notch, in the form of a hole, reduces fatigue strengths by up to 28% at some stress levels in zero-to-tension cycles. Analysis indicates this reduction is caused by loss of ductility of galvanized steel plate compared with as-rolled black plate. Initial coefficients of friction for galvanized plates in these tests were about one half the values for plates with mill scale. Under reversed loading, galvanized joints locked after a few cycles of load, and slip ceased. Because of this action and the fact that fatigue failures of the connections occurred in front of the net section, the fatigue strength of galvanized friction-type connections was comparable to that of identical black connections in zero-to-tension and one-half compression-to-tension cycles. COMPARISON OF WATERFLOOD CORROSION DETECTION AND MONITORING DEVICES,
Atlantic Richfield Co., Bakersfield, Calif.
R. L. Alvis.
Materials Protection, Vol 8, No 2, p 39-42, February 1969. 4 fig, 2 tab, 1 ref.

Descriptors: *Corrosion, *Oxidation, *Pitting, *Chemical reactions, Wells, Injection wells.
Identifiers: Oxygen scavengers, Membrane type oxygen sensor, Water flood, Corrosion coupons.

Most published information on various corrosion detection and monitoring devices has been derived from laboratory tests. A comparison is presented of 3 methods of corrosion detection and monitoring electrical resistance, polarization rate and coupon analysis used in a California water injection system. Also presented is a case study of the role of D.O. in corrosion and the relative effectiveness of 4 chemical scavengers in the control of D.O. in the system. No single device or technique is totally effective in corrosion detection or monitoring, therefore a combination program tailored to the system is required. (Campbell-NWWA)

SAND CONTROL - 3. CHEMICAL CONSOLIDATION,
Standard Oil Co. of California, San Francisco.
E. B. Rodgers, Jr.
Oil and Gas Journal, Vol 69, No 46, p 152-154, 156, 161, November 15, 1971. 3 fig, 1 tab.

Descriptors: *Aquifer characteristics, Permeability, Cement, *Grouting, Wells, Oil industry, *Hydraulic-fracturing, Hydrostatic pressure, Rock mechanics, Stress, *Chemical reactions.
Identifiers: Well stimulation, *Resin compounds, Organic compounds, *Formation-fracture pressures.

The newest approach to solving the sanding problem in well systems in consolidation, or cementation of the production formation by chemical means. This method began in the late 1940s. While some inorganic methods have been attempted, commercial processes today consist of injecting liquid organic substances (more appropriately called resins than plastics) into the for-

mation where they harden (polymerize) by one of two processes, i.e. preactivation or in situ. Resin characteristics, process classification, process characteristics, factors affecting results and application methods are discussed. Critical to the success of this method is the selection of the resin, and control of the injection pressures to assure proper particle bonding and uniform consolidation for it takes only one unconsolidated preforation to cause a process failure. (Smith-NWWA)

HERE'S A NEW SAND PACK METHOD,
Halliburton Services, Tulsa, Okla.
B. M. Young, J. G. Cook, and A. L. Donaldson, Jr.
Oil and Gas Journal, Vol 67, No 10, p 64-67, March 10, 1969. 3 fig, 2 tab, 7 ref.

Descriptors: *Oil wells, Cement, Grouting, Oil industry, *Chemical reactions, Permeability, Aquifer characteristics, Louisiana.
Identifiers: Resin compounds, Offshore wells, Karpoff, *Well construction.

The resin-sand-pack method is designed to control sand in many of the more difficult cases; long and short intervals in multiple completions, old wells, and in some cases, newly completed zones. It is applicable to all formations that will accept a quantity of sand. In one of the newest developments a small quantity of furan consolidating resin is dispersed in a diesel oil carrying fluid just before or during sand proportioning, (Karpoff's formular for proper sand pack seizing is used). Unlimited placement time is achieved by injecting the oil-catalyst (strong organic acid) solution after final sand placement. Instant resin harding occurs upon contact, yielding short well shut-in times. Resin-sand-pack application has favorable cost effectiveness due to the overall speed of process completion, and no requirement for special down hole equipment. (Smith-NWWA)

CATHODIC PROTECTION FOR COATED STEEL PIPELINES,
Colorado Springs Dept. of Public Works, Colo. Water Div.
E. W. Bailey.
Journal of the American Water Works Association, Vol 63, No 2, p 85-88, February 1971. 3 fig.

Descriptors: *Pipelines, Engineering structures, *Metal pipes, Joints, Linings, *Cathodic protection, Equipment, *Corrosion, *Resistivity, *Colorado.
Identifiers: Dresser couplings, As-built drawings, Sacrificial anodes, Electrical bonding, Colorado Springs (Colo).

Cathodic protection of steel water pipelines, although widely practiced today was not a common practice fifteen years ago. Steel waterpipes installed fifteen or more years ago within the Colorado Springs water system were generally coal-tar coated and lined. A recurring leakage problem in a 75 mile, 30 inch, transmountain diversion pipeline addition to the city's water system, with its associated high repair cost (approx. $1000-2000 per leak), promoted the investigation and eventual installation of cathodic protection for the pipeline. The history and progressive steps of this project are detailed. (Campbell-NWWA)

CORROSION MONITORING METHOD REDUCES EFFECT OF VARIABLES IN ANALYZING OIL FIELD WATERS,
Texaco, Inc., Bellaire, Tex. Bellaire Research Labs.
A. C. Nestle.
Materials Protection, Vol 8, No 5, p 49-52, May 1969. 3 fig, 1 tab, 3 ref.

Descriptors: *Corrosion, Wells, Oil wells, On-site tests, Testing procedures, Analytical techniques, *Sampling, *Water analysis, Monitoring.
Identifiers: *Dissolved iron content, Visual comparators, Photoelectric comparators.

Corrosion control trend data can be obtained using an improved method for dissolved iron content testing which includes sampling, sample handling and analysis. Interpretation of trends usually shows either the degree of corrosion control success or the need for further and more specific monitoring. A practical method for analyzing water for dissolved iron is described. The method is based on modified conventional practices and appears to be unique in regard to the reproducibility of results that can be obtained. Procedures for sampling and field and laboratory testing are detailed. (Hunt-NWWA)

CORROSION OF METALS IN TROPICAL WATERS---STRUCTURAL FERROUS METALS,
Naval Research Lab., Washington, D.C.
C. R. Southwell, and A. L. Alexander.
Materials Protection, Vol 9, No 1, p 14-23, January 1970. 11 fig, 4 tab, 13 ref.

Descriptors: *Corrosion, Pitting, Wells, *Chemical reactions, Damages, *Metallurgy, *Saline water.
Identifiers: *Corrosion time curve, Stabilized corrosion rates, *Oxygen diffusion control.

Corrosion data are reported for 20 structural ferrous metals exposed over a varying time period to natural tropical seawaters and fresh waters - situations analogous to those encountered in fluid-zone penetrations experienced in ground water development. Time-corrosion curves derived from both weight loss and pitting are presented for many of the ferrous alloys and tabulated data for all metal environment combinations are included. These comprehensive long term results comprise the most extensive collection of accurate sea water and fresh water corrosion data presently available. After initial periods of changing slopes, corrosion rates for most of the ferrous metals stabilize to constant values. These steady state rates are presented for each exposure and provide a significant means for comparing the corrosion resistance of the different metals in the various environments and for estimating useful life over extended periods. Corrosion curves for eight low alloy steels, Aston process wrought iron, and various cast irons and steels are evaluated against C steel. Marine corrosion in the tropics is compared with available ferrous metal results from temperate latitudes. (Hunt-NWWA)
W73-12772

GALVANIC CORROSION OF METALS IN CEMENTING MATERIALS,
J. W. Pitts.
The Military Engineer, Vol 59, No 387, p 40-41, January-February 1967. 2 fig.

Descriptors: *Corrosion, Damage, *Chemical reactions, *Construction materials, Well casings.
Identifiers: *Galvanic action, Galvanic cell.

Galvanic corrosion of metals embedded in cementing materials is known to have caused failures of steel-reinforced concrete systems containing aluminum conduit and copper tubing. Studies of such failures have led to the understanding of the basic causes of the corrosion, and actions that can be taken to eliminate the problem. A discussion is presented of the cause-effect of this type of corrosion and precautions to be taken during construction to eliminate the problem. (Hunt-NWWA)
W73-12775

PITLESS UNITS AND ADAPTERS,
Environmental Protection Agency, Washington, D.C. Div. of Water Supply.
W. J. Whitsell.
Water Well Journal, Vol 26, No 8, p 34-37, August 1972. 1 fig.

Descriptors: Equipment, *Wells, *Water wells, *Corrosion, Well casing, Metallurgy, Metals, Materials.
Identifiers: Electrolytic corrosion, *Pitless adapters, Positive pressure conditions, Negative pressure conditions.

Because of the pollution hazards involved, many states prohibit the use of a pit house. A commercially available unit known as a pitless adapter eliminates the need for a well pit. A specially designed connection between the underground horizontal discharge pipe and the vertical casing pipe makes it possible to terminate the permanent watertight casing of the well at a safe height above final grade. The underground section of the discharge pipe is permanently installed eliminating the need for attention during maintenance operations. A discussion is presented of advantages and installation procedures for pitless adapters. (Hunt-NWWA)

GUIDE SPECIFICATION FOR CHEMICAL GROUTS.
American Society of Civil Engineers, New York. Committee on Grouting.

Journal of Soil Mechanics and Foundations Division, American Society of Civil Engineers, Vol 94, No SM2, p 345-352, March 1968.

Descriptors: *Chemical grouting, Wells, Groundwater, *Grouting.
Identifiers: Cementing specification, Aquifer protection, *Water well construction.

Specifications are provided for chemical grouts which are intended to make it possible for the project engineer to obtain the chemical or chemicals desired, and to effect grouting operations intended with these materials. For the purpose of these specifications, grouts are considered to be any material which may be pumped or placed into voids in a formation to change the formation properties. Chemical grouts are defined as true solutions, which contain no suspended particles unless those are deliberately added for some specific purpose. (Campbell-NWWA)

PRELIMINARY STUDY OF SABLEFISH CULTURE, A POTENTIAL NEW INDUSTRY,
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.

W. A. Kennedy.
J Fish Res Board Can. Vol 29, No 2, p 207-210. 1972. Illus.
Identifiers: Anoplopoma-Fimbria, *Fish industry, *Sablefish culture, Fish rearing.

A new industry may be possible based on capture of 2nd-year juvenile sablefish (Anoplopoma fimbria) weighing about 300 g then rearing them to 4 kg for sale. Sablefish were easy to rear. Under growth-favoring conditions they gained about 150 g/fish/mo., used about 5 kg wet weight of feed/kg gained, and had mortalities of less than 1%/mo. Concentrations of at least 43 kg of fish/m2 or 70 g/l did not adversely affect growth or mortality.--Copyright 1972, Biological Abstracts, Inc.

REARING CHANNEL CATFISH FINGERLINGS UNDER INTENSIVE CULTURE CONDITIONS,
Skidway Inst. of Oceanography, Savannah, Ga.
R. R. Stickney, T. Murai, and G. O. Gibbons.
Prog Fish-Cult. Vol 34, No 2, p 100-102, 1972. Illus.
Identifiers: *Ictalurus-Punctatus, *Rearing (fish), Tank cultures (Fish), *Channel catfish, *Catfish (Fingerlings).

Data obtained from rearing channel catfish (Ictalurus punctatus) fingerlings at three stocking densities under intensive tank culture conditions indicated that a stocking density which will yield approximately 1 lb/cf when the fish reach an average weight of 1/2 oz is desirable. A higher density (1.5 lb/cf (ft3)) resulted in considerably reduced growth rates, whereas growth rates at a lower density (0.5 lb/cf) were not substantially more rapid than that of fish reared to 1 lb/cf, until the desired maximum densities were approached.--Copyright 1972, Biological Abstracts, Inc.

THE AFRICAN GREAT LAKES FISHERIES: PAST, PRESENT AND FUTURE,
Food and Agriculture Organization of the United Nations, Jinja (Uganda). Lake Victoria Fisheries Research Project.
P. B. N. Jackson.
Afr J Trop Hydrobiol Fish. Vol 1, No 1, p 35-49. 1971.
Identifiers: *Africa, Alestes-imberi, Alestes-lateralis, Bagrus, *Fisheries, Great, Haplochromis, Lakes, Lates-niloticus, Management, Tilapia.

Earliest African fisheries were by waterside peoples using locally fabricated materials. Seine nets of woven twine, of Arabian origin, were later introduced. Gill-nets were introduced in 1905 and remain the most widely used gear. Tilapia species, all inhabiting inshore waters, remain the most important fish caught, but catches generally continue to decline. Further basic studies on Tilapia are necessary to improve management. Large boats with power-operated gear are an important recent innovation which may supplant canoes and gill-nets as producers of the main catch in large lakes, but for success require careful economic planning due to the high initial cost of vessels and essential shore installations. There are numerous management problems e.g. Labeo being heavily fished on spawning migrations, the capture of juvenile Bagrus while fishing for Haplochromis, or of Lates while fishing for clupeoids. Lates niloticus introduced to Lake Victoria have not succeeded so quickly as in Lake Kyoga, due probably to the young competing for food with Haplochromis species. The newcomer Alestes lateralis has supplanted A. imberi in Lake Kariba, through having a more extended spawning season.--Copyright, 1973, Biological Abstracts, Inc.

CONVERSION, MAINTENANCE AND ASSIMILATION FOR WALLEYE, STIZOSTEDION VITREUM VITREUM, AS AFFECTED BY SIZE, DIET AND TEMPERATURE
Ministry of Natural Resources, Port Dover (Ontario).
J. R. M. Kelso.
J Fish Res Board Can. Vol 29, No 8, p 1181-1192. 1972. Illus.
Identifiers: Amphipods, Assimilation, Conversion, Crayfish, Diet, Maintenance, Size, Stizostedion-Vitreum-Vitreum, Temperature, *Walleye, *Fish management.

An optimum ration was not readily apparent as conversion differed only slightly at high and low rations. Gross (K1) and net (K2) conversion was affected by neither ration size nor temperature, but decreased with increasing fish size. Conversion of the 3rd order (K3) was affected only by temperature, being greater at higher temperatures. Gross and net conversion were consistently lower at cycled temperatures, 16-8C. Gross and net conversion were similar since the high assimilation efficiency (82.1-97.9%) of S. vitreum vitreum did not greatly alter the latter. Assimilation efficiency was dependent upon diet type, least for invertebrates (82.1% for amphipods and 83.5% for crayfish) and greatest for fish (96.9% for age O perch and 97.9% for emerald shiners). Assimilation efficiency decreased with increasing walleye size (slope of -0.0045) irrespective of the food organism. Regurgitation of crayfish occurred in 2 of 3 trials, and it was not established if this was a natural phenomenon. Maintenance requirement per gram was independent of fish size, but was affected by temperature. Maintenance between temperatures of 4-12C was similar, 33.3-45.7 cal/g walleye/wk, but increased greatly above 12C. Results from maintenance experiments paralleled Winberg's (1969) approximation of routine metabolism.--Copyright 1973, Biological Abstracts, Inc.
W73-12832

PREDATION BY RAINBOW TROUT (SALMO GAIRDNERI): THE INFLUENCE OF HUNGAR, PREY DENSITY AND PREY SIZE,
Bedford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
D. M. Ware.
J Fish Res Board Can. Vol 29, No 8, p 1193-1201. 1972. Illus.
Identifiers: Density, Hunger, *Predation, Prey, *Rainbow trout, Salmo-Gairdneri, Size, Trout.

The feeding behavior of rainbow trout (S. gairdneri) was investigated by exposing fish to several densities and sizes of prey over a range of 4 substrates of varying complexity. Within substrate treatments the rate of predation could be stimulated by increasing either prey density, prey size, or predator hunger. Between treatments, however, both the intensity of predation and total food consumption proved to be inversely related to the complexity of the substrate because a number of prey were able to find cover and thus escape detection. The results further indicate that the nature of foraging behavior may be controlled by a critical rate of food capture. If trout did not exceed an average of .058 captures sec-1, substrate-oriented search proceeded to wane.--Copyright 1973, Biological Abstracts, Inc.
W73-12836

DESIGN OF TRAPNET WITH INTERCHANGEABLE PARTS FOR THE CAPTURE OF LARGE AND SMALL FISHES FROM VARYING DEPTHS,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
R. J. Beamish.
Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 587-590, April 1973. 2 fig, 1 tab, 2 ref.

Descriptors: *Fishing gear, *Freshwater fish, *Marine fish, *Design, *Fabrication, Depth, Brook trout, Rainbow trout, Walleye, Yellow perch.
Identifiers: *Convertible trapnets, *Trapnets, Wolf Lake, White sucker, Common shiner, Redbreast sunfish, Brown bullhead, Southern redbelly dace, Cutlips minnow, Creek chub, Blacknose dace, Slimy sculpin, Lake whitefish, Arctic char, Smallmouth bass, Northern pike, Salvelinus alpinus, Coregonus clupeaformis, Salmo gairdneri, Micropterus dolomieui, Esox lucius, Stizostedion vitreum vitreum, Perca flavescens.

A new design is described for a convertible trapnet that is effective in catching small and large fishes in depths ranging from 3 to 15 ft (1-5 m). The nets are constructed from 1/32-inch (0.8-mm) square mesh, green mosquito-type nylon netting. Details of construction are included. Three designs have been successfully tested: (1) a basic 3-ft design, weight 31 lb; (2) a 9-ft net, weight 48 lb, that converts to the basic 3-ft design, and (3) a 6-ft net, weight 35 lb, that is similiar to the 9-ft model but reduced in proportions and not convertible. These three designs when fished in Wolf Lake (New York) captured nine of the ten species reported to be present. Trapnets of similar design have captured many other species of small and large freshwater fishes including arctic char, lake whitefish, rainbow trout, walleye, and yellow perch. They have also fished successfully in some marine habitats. (Holoman-Battelle)

THE GROWTH, REPRODUCTION AND FOOD OF THE ROACH RUTILUS RUTILUS (L.), OF THE RIVER LUGG, HEREFORDSHIRE,
Freshwater Biological Association, Wareham (England). River Lab.
J. M. Hellawell.
J Fish Biol. Vol 4, No 4, p 469-486, 1972, Illus.
Identifiers: *England, Growth, Herefordshire, Insect, Lugg, Molusks, Reproduction, River, *Roach, Rutilus-Rutilus, Vegetation, *River Lugg.

Checks were formed on the scales in June and July. A dominant 1959 year class accounted for half the population present in 1964. Females grew faster than males and attained greater ultimate size. Growth in the River Lugg was good in comparison with rates in other British waters. The sex ratio was found to change with age; a predominance of males in the youngest age classes changed to a preponderance of females in the older classes. The youngest fishes caught (3+) were already sexually mature. The gonads were a constant proportion of the body weight for fishes

of all sizes at a given season. Spawning was completed by June; males were ripe in May. The ovaries recovered more rapidly than the testes after spawning. Seasonal variation in feeding activity, with higher activity in summer, was observed and could be correlated with temperature. Seasonal changes in the diet could be related to availability. The diet was predominantly vegetable; the most important animal component, aquatic insect larvae, accounted for 11% of the total diet. Aerial insects were rarely eaten. Diet varied with age: molluscs being particularly important to older roach; younger roach consumed large amounts of substrate material. There is some evidence that young roach indiscriminately ingest substrate material but older roach are more selective and reject inert material.--Copyright 1973, Biological Abstracts, Inc.

PRIMARY PRODUCTIVITY IN A NEW AND AN OLDER CALIFORNIA RESERVOIR,
California State Dept. of Fish and Game, Sacramento.
L. L. Chamberlain.
Calif Fish Game. Vol 58, No 4, p 254-267, 1972.
Identifiers: *California, Carbon-14, *Fish populations, Fishery management, *Primary productivity, Reservoirs.

The sport fishery in new reservoirs often reaches a peak and then undergoes a marked decline a few years following impoundment. One theory attributes such declines to diminishing basic fertility. To test this theory, primary productivity in a new reservoir was measured by the C14 method for 4 yr. An older reservoir served as a control. High initial rates of C fixation in the new reservoir, attributed to flooding of organic material, were transitory. Subsequent patterns of primary productivity were similar in the 2 waters. Increases in primary productivity in both reservoirs were associated with establishment of planktivorous fish populations and demonstrated that declining primary productivity is not as inevitable result of initial reservoir aging.--Copyright 1973, Biological Abstracts, Inc.

Sand Control - 3. Chemical Consolidation,
W73-12760 8G

Here's a New Sand Pack Method,
W73-12761 8G

Corrosion of Metals in Tropical Waters---Structural Ferrous Metals,
W73-12772 8G

Galvanic Corrosion of Metals in Cementing Materials,
W73-12775 8G

Aromatic Hydroxylation as an Analytical Reaction,
W73-12853 5A

CHEMICAL RECOVERY
Rayonier Makes Major Breakthrough in Sulfite Pollution Control.
W73-12542 5D

CHEMICAL SLUDGES
Characterization of Chemical Sludges,
W73-12871 5A

CHEMICAL WASTES
Identification and Control of Petrochemical Pollutants Inhibitory to Anaerobic Processes,
W73-12513 5D

CHEMICALS
Control of Oil and Other Hazardous Materials.
W73-12427 5G

CHEMUNG RIVER
Annual Report of the New York State Urban Development Corporation, 1972.
W73-12356 3D

CHENA RIVER (ALAS)
Chena River Lakes Project, Alaska, Problems Relating to Channel Development, Erosion, and Bank and Levee Protection,
W73-12559 8B

CHERNOZEMS
Characteristics of Water Migration in a Thick Leached Chernozem (Osobennosti dvizheniya vody v vyshchelochennom moshchnom chernozeme),
W73-12743 2G

Hydrophysical Properties and Water Regime of Crimean Southern Chernozems in a Field Crop Rotation (Vodno-fizicheskiye svoystva i vodnyy rezhim yuzhnykh chernozemov Kryma v polevom sevooborote),
W73-12744 2G

Water Regime in a Crop Rotation on Chernozem Soils in Southeast Russia (Vodnyy rezhim v sevooborote na chernozemnykh pochvakh Yugo-Vostoka),
W73-12747 2G

CHERRY FRUIT
Antitranspirant Film: Curtailing Intake of External Water by Cherry Fruit to Reduce Cracking,
W73-12992 2D

CHESAPEAKE BAY
Upper Chesapeake Bay Water Quality Studies, 1968-1971.
W73-12601 5A

CHICAGO
The Lakefront Plan of Chicago.
W73-12367 4C

CHICAGO RIVER (ILL)
Viruses in Metropolitan Waters: Concentration by Polyelectrolytes, Freeze Concentration, and Ultrafiltration,
W73-12867 5F

CHIRONOMIDAE
Biologically Active Compounds in the Aquatic Environment: The Uptake and Distribution of (1,1-Dichloro-2,2-Bis (P-Chlorophenyl) Ethylene), DDE by Chironomus tentans Fabricius (Diptera: Chironomidae),
W73-12804 5B

CHITA OBLAST
Hydrochemical Description of the Onon-Argun' Steppe (Gidrokhimicheskaya kharakteristika Onon-Argunskoy stepi),
W73-12746 2K

CHLORELLA-ELLIPSOIDEA
Hydrostatic Pressure in Relation to the Synchronous Culture of Algae in Open and Closed Systems,
W73-12798 5C

CHLORINATION
Waste Water Purification by Breakpoint Chlorination and Carbon Adsorption,
W73-12459 5D

CHLORINE
The Evaluation of Existing Field Test Kits for Determining Free Chlorine Residuals in Aqueous Solutions,
W73-12426 5A

Disinfection of Sewage Effluents,
W73-12504 5D

CHLORINE TEST KITS
The Evaluation of Existing Field Test Kits for Determining Free Chlorine Residuals in Aqueous Solutions,
W73-12426 5A

CHLORINITY
Fungi Colonizing Wood Submerged in the Medway Estuary,
W73-12825 2L

CHLOROPHYLL
Laser Induced Fluorescence in Algae: A New Technique for Remote Detection,
W73-12841 5A

CHOLINESTERASE
An Immobilized Cholinesterase Product for Use in the Rapid Detection of Enzyme Inhibitors in Air or Water,
W73-12901 5A

CHROMATOGRAPHY (THIN LAYER)
Simultaneous Detection of the Residues of Atrazine and Linuron in Water, Soil, Plant, and Animal Samples by Thin-layer Chromatography,
W73-12811 5A

CIRQUES
Trials on Trends Through Clusters of Cirques,
W73-12732 2J

CISTERNS
Insecticide Residues in Water and Sediment from Cisterns on the U.S. and British Virgin Islands - 1970,
W73-12894 5B

CITIES
Systems Approach to Metropolitan and Regional Area Water and Sewer Planning,
W73-12351 6A

Coordination of Agricultural and Urban Water Quality Management in the Utah Lake Drainage Area,
W73-12508 5G

Evaluation of Urban Water Management Policies in the Denver Metropolitan Area,
W73-12510 5G

CITRUS
Diurnal and Seasonal Effects of Environment on Plant Water Relations and Fruit Diameter of Citrus,
W73-12805 3F

Evaluation of Tensiometers for Estimating Plant Water Stress in Citrus,
W73-12985 3F

Antitranspirants for Conservation of Leaf Water Potential of Transplanted Citrus Trees,
W73-12993 2D

CITY PLANNING
Comprehensive Public Water Supply Study for Schenectady County, New York.
W73-12358 3D

Summary Report: Comprehensive Sewerage Study for Schenectady County, New York.
W73-12359 5G

The Lakefront Plan of Chicago.
W73-12367 4C

Stream Quality Preservation Through Planned Urban Development,
W73-12518 5G

CLASSIFICATION
Classification of Coastal Environments, Procedures and Guidelines,
W73-12433 2L

Some Marine Diatoms from the Galapagos Islands,
W73-12902 2I

Classification of the Coastal Environments of the World: Part II. Africa,
W73-12950 2L

CLAY COMPOSITION
Influence of Moisture Regime on the Genesis of Laterite Soils in South Inida: II. Clay Composition and Mineralogy,
W73-12721 2G

CLEAR CREEK (TEX)
Description and Ecology of Hyaiella Texana N. Sp. (Crustacea: Amphipoda) from the Edwards Plateau of Texas,
W73-12900 2I

CLEAR LAKE (CALIF)
Nitrogen: Recent Studies on the Role of Nitrogen in the Biostimulation and Eutrophication of Aquatic Ecosystems,
W73-12393 5C

CLIMATIC DATA
Climatology of Rainfall Probabilities for Oahu, Hawaii,
W73-12587 2B

CLOUD PHYSICS
On The Number Distribution of Hail Growing in Updrafts,
W73-12602 2B

Dynamics of a Falling Particle Zone,
W73-12603 2B

CLOUDS
Water Content in Convective Storm Clouds,
W73-12536 2B

COAGULATION
Fluidized Bed Clarification as Applied to Wastewater Treatment,
W73-12505 5D

COAL MINE WASTES
Buffalo Creek Dam Disaster: Why It Happened,
W73-12411 4C

Control of Mine Drainage from Coal Mine Mineral Wastes - Phase II - Pollution Abatement and Monitoring,
W73-12516 5G

COAST GUARD REGULATIONS
Proposed Oil Pollution Regulations, (Final Environmental Statement).
W73-12955 5G

COASTAL ENGINEERING
Final Environmental Statement: Small Beach Erosion Control Project, Broadkill Beach, Delaware.
W73-12430 8B

Grays Harbor Estuary, Washington: Report 2. North Jetty Study,
W73-12581 8B

COASTAL ENVIRONMENTS
Classification of the Coastal Environments of the World: Part II. Africa,
W73-12950 2L

COASTS
Process-Form Variability of Multiclass Coasts: Baja California,
W73-12422 2L

Classification of Coastal Environments, Procedures and Guidelines,
W73-12433 2L

Heavy Metals in Estuaries and the Coastal Zone,
W73-12606 5B

An Interdisciplinary Study of the Estuarine and Coastal Oceanography of Block Island Sound and Adjacent New York Coastal Waters,
W73-12629 5A

Classification of the Coastal Environments of the World: Part II. Africa,
W73-12950 2L

Investigation of the Nature, Extent and Fate of Natural Oil Seepage Off Southern California,
W73-12958 5B

COCCONEIS SCUTELLUM
Fouling on Eelgrass (Zostera Marina L.),
W73-12631 5G

CODIUM FRAGILE
Ecological Studies of Codium fragile in New England, USA,
W73-12918 5C

COLONIZATION
Fouling on Eelgrass (Zostera Marina L.),
W73-12631 5G

Dispersion, Dispersal, and Persistence of the Annual Intertidal Alga, Postelsia Palmeformis Ruprecht,
W73-12883 5C

COLOR
System for Removing Color From Paper Mill Liquid Waste,
W73-12445 5D

The Problem of Color Measurement for Pulp Manufacturing Effluents (Le probleme de la mesure de couleur des effluents de fabrication des pates),
W73-12526 5G

Practical Decolorization of Kraft Mill Effluents (Praktyka usuwania barwy sciekow posiarczanowych),
W73-12544 5D

Optical Properties and Color of Lake Tahoe and Crater Lake,
W73-12926 5A

COLOR REMOVAL
Ion Exchange Color and Mineral Removal from Kraft Bleach Wastes,
W73-12522 5D

COLORADO
Mathematical Modeling of Water Management Strategies in Urbanizing River Basins,
W73-12509 5G

Evaluation of Urban Water Management Policies in the Denver Metropolitan Area,
W73-12510 5G

Report on Arkansas Valley Conduit for Southeastern Colorado Water Conservancy District, Four Corners Regional Commission and U.S. Bureau of Reclamation.
W73-12577 4A

Cathodic Protection for Coated Steel Pipelines,
W73-12765 8G

Publications of Water Resources Investigations in Colorado and Selected Publications Pertaining to Colorado.
W73-12954 2A

COLORADO PLATEAU
The Interrelationships of the Vegetation Characters of Four Salt Desert Shrub Associations of Colorado Plateau,
W73-12791 3B

COLORADO RIVER
Mineral Pollution in the Colorado River Basin,
W73-12715 5B

COLORIMETRY
Determination of Alkylbenzenesulfonate (ABS) in Bottom Sediment,
W73-12932 5A

COLUMBIA RIVER
Particulate Manganese in Sea Water Stressing Regimes in Marine Anoxic Basins,
W73-12854 5A

COLUMNS
Strength Analysis of Corner Column-Slab Connections,
W73-12465 8A

COMBINED TREATMENT
Joint Treatment of Pulp Mill Effluents and Municipal Sewage.
W73-12528 5D

COMMERCIAL FISHING
Peruvian Fisheries: Conservation and Development.
W73-12689 6B

Extinction of a Fishery by Commercial Exploitation: A Note,
W73-12692 6B

Costs and Profitability in the Commercial Fishing Industry: The Insurance Dilemma,
W73-12699 6B

COMMUNITY DEVELOPMENT
A Study of Selected Aspects of Rural Water System Development in Mississippi,
W73-12492 6B

Economic and Related Impacts of Rural Water Systems in Mississippi,
W73-12493 6B

The Effect of Price and Other Selected Variables on Water Consumption,
W73-12495 6B

COMPARATIVE STUDIES
A Comparison of Liquid Scintillation and Geiger-Muller Estimates of Primary Productivity in an in Situ Experiment,
W73-12848 5A

Annual Production of a Stream Mayfly Population: A Comparison of Methods,
W73-12905 5B

COMPETING USES
Wildlife Habitat Improvement in Relation to Watershed Management in the Southwest,
W73-12404 4D

COMPREHENSIVE PLANNING
The Niagara River Pollution Abatement Progress - 1971.
W73-12380 5G

COMPUTER PROGRAMS
Regional Sewer System, Planning and Cost Estimation Model,
W73-12357 5G

Prediction of Unsteady Salinity Intrusion in Estuaries: Mathematical Model and User's Manual,
W73-12728 2L

Instrumental and Numerical Considerations for On-Line Interpretation of High Resolution Mass Spectral Data,
W73-12874 2K

CONCRETE TESTING
Tests of Selected Insulating Materials for Mass Concrete,
W73-12431 8F

CONDENSATION
High-Purity Distilled Water Producing Apparatus,
W73-12450 3A

Heat-Exchanger for Desalting Sea Water,
W73-12453 3A

CONFERENCES
Proceedings of Seminar on Eutrophication and Biostimulation.
W73-12391 5C

Heavy Metals in the Environment.
W73-12604 5B

CONFINED WATER
Environmental Isotopes and Circulation in Aquifers Under Venice (Isotopes du Milieu et Circulations dans les Aquiferes du Sous-Sol Venitien),
W73-12419 2F

CONNECTICUT
Regional Utilities Study: Drainage Volume of Technical Appendix.
W73-12368 4A

Regional Utilities Study: Sewerage Volume of Technical Appendix.
W73-12369 5D

A Proposed Streamflow Data Program for Connecticut,
W73-12748 4A

CONSERVATION
Peruvian Fisheries: Conservation and Development.
W73-12689 6B

CONSTRUCTION COSTS
A Pilot Fish-Pond System for Utilization of Sewage Effluents, Humboldt Bay, Northern California,
W73-12434 5D

Construction Costs of Water Supply and Sewage Networks in Poland--1961-1970,
W73-12703 6C

CONSTRUCTION MATERIALS
Galvanic Corrosion of Metals in Cementing Materials,
W73-12775 8G

CONSTRUCTION SITES (DAMS)
Mussels in the Unique Nickajack Dam Construction Site, Tennessee River, 1965,
W73-12800 2I

CONSUMPTIVE USE
Consumptive Use of Water by Dwarf Wheat in Udaipur Valley,
W73-12387 3F

Consumptive Use of Water by Cotton Grown in Transition Tract of Dharwar Under Rainfed Conditions,
W73-12988 3F

CONTAINERSHIPS
Sea-Land Navigation Studies; Hydraulic Model Investigation,
W73-12567 8B

CONTINUOUS FOOTINGS
Bearing Capacity of Footings in Plane Strain,
W73-12484 8D

CONTROL
Nutrient Control in North San Francisco Bay,
W73-12398 5C

CONTROLLED PRESSURE SURGE
Back-Surge Technique Improves Well Completions,
W73-12773 8B

CONVECTION
Convective Ground Water Flow,
W73-12722 2F

CONVERSION SPEED
Boost A/D Rates with Staggered Operation,
W73-12893 7C

CONVERSION SYSTEMS
A Method for High Speed BCD-to-Binary Conversion,
W73-12892 7C

CONVERTIBLE TRAPNETS
Design of Trapnet with Interchangeable Parts for the Capture of Large and Small Fishes from Varying Depths,
W73-12899 8I

COPEPODS
Crustacean Plankton and the Eutrophication of Lakes in the Okanagan Valley, British Columbia,
W73-12624 5C

The Reduction of Copper Toxicity in a Marine Copepod by Sediment Extract,
W73-12909 5C

COPPER
Some Short-Term Indicators of Sublethal Effects of Copper on Brook Trout, Salvelinus Fontinalis,
W73-12859 5C

The Reduction of Copper Toxicity in a Marine Copepod by Sediment Extract,
W73-12909 5C

CORRECTIVE TAXES
Externalities, Welfare, And the Feasibility of Corrective Taxes,
W73-12694 6B

CORRELATION ANALYSIS
The Interrelationships of the Vegetation Characters of Four Salt Desert Shrub Associations of Colorado Plateau,
W73-12791 3B

CORROSION
Corrosion by the Sulphate-Reducing Bacteria,
W73-12756 5G

Comparison of Waterflood Corrosion Detection and Monitoring Devices,
W73-12757 8G

Cathodic Protection for Coated Steel Pipelines,
W73-12765 8G

Corrosion Monitoring Method Reduces Effect of Variables in Analyzing Oil Field Waters,
W73-12767 8G

Corrosion of Metals in Tropical Waters---Structural Ferrous Metals,
W73-12772 8G

Galvanic Corrosion of Metals in Cementing Materials,
W73-12775 8G

Pitless Units and Adapters,
W73-12776 8G

CORROSION CELL
Corrosion by the Sulphate-Reducing Bacteria,
W73-12756 5G

CORROSION TIME CURVE
Corrosion of Metals in Tropical Waters---Structural Ferrous Metals,
W73-12772 8G

COST ALLOCATION
Anti-Pollution Policy and Cost Allocation: The Issues in Practice,
W73-12677 6B

COST ALLOCATION

The Role of Uniform Standards in International Environmental Management.
W73-12686 6B

COST ANALYSIS
Regional Sewer System, Planning and Cost Estimation Model,
W73-12357 5G

Environmental Cost of Mining,
W73-12687 5G

Construction Costs of Water Supply and Sewage Networks in Poland--1961-1970,
W73-12703 6C

Cost Curves for Cross-Drainage Works,
W73-12704 4A

A Study of the Economic Impact on the Steel Industry of the Costs of Meeting Federal Air and Water Pollution Abatement Requirements. Part I - Executive Summary.
W73-12707 5G

Impact of Costs Associated with New Environmental Standards Upon the Petroleum Refining Industry. Part I. The Impact of Environmental Control Costs.
W73-12708 5G

A Descriptive Analysis of the Bakery Products Industry Detailing Industry Trends and Characteristics Relevant to Economic Impact Analysis of Environmental Standards. Part II.
W73-12709 5G

A Study of the Impact of Pollution Standards and Charges on the Bakery Industry. Part III.
W73-12710 5G

COST-BENEFIT ANALYSIS
Environmental Quality Indicators and Social Indicators,
W73-12679 6B

Some Limitations of Benefit-Cost Analysis in Respect of Programmes with Environmental Consequences,
W73-12682 6B

Evaluation of Environmental Intangibles,
W73-12688 6B

Costs and Profitability in the Commercial Fishing Industry: The Insurance Dilemma,
W73-12699 6B

COST TRANSFER
Identification and Achievement of Environmental Quality Levels in Managing the Use of Natural Resources,
W73-12696 5G

COSTS
Antipollution Policies, Their Nature and Their Impact on Corporate Profits,
W73-12695 5G

COTTON
Influence of Certain Rotations Upon Cotton Production in the San Joaquin Valley,
W73-12975 3F

Consumptive Use of Water by Cotton Grown in Transition Tract of Dharwar Under Rainfed Conditions,
W73-12988 3F

CRABS
Biology of Rock Crab (Cancer Irroratus) in Northumberland Strait,
W73-12390 2L

CRATER LAKE
Optical Properties and Color of Lake Tahoe and Crater Lake,
W73-12926 5A

CRAYFISH
The Crayfish, Orconectes Virilis, As an Indicator of Mercury Contamination,
W73-12632 5A

CRITICAL DEPTH
Computer Determination of Critical Depth Control Points in Open Channel Flow,
W73-12483 8B

CRITICAL EROSION VELOCITY
Leaching of Cement from a Concrete Pile Section by Groundwater Flow,
W73-12766 8F

CRITICAL VELOCITY
Computer Determination of Critical Depth Control Points in Open Channel Flow,
W73-12483 8B

CROP PRODUCTION
Methods for Pulp and Paper Mill Sludge Utilization and Disposal,
W73-12519 5E

Annual Water Balance and Agricultural Development in Alaska,
W73-12664 3F

Influence of Certain Rotations Upon Cotton Production in the San Joaquin Valley,
W73-12975 3F

CROTONALDEHYDE
Identification and Control of Petrochemical Pollutants Inhibitory to Anaerobic Processes,
W73-12513 5D

CRUDE OIL
Selective Substrate Utilization by Marine Hydrocarbonoclastic Bacteria,
W73-12621 5B

CRUSTACEANS
Crustacean Plankton and the Eutrophication of Lakes in the Okanagan Valley, British Columbia,
W73-12624 5C

Description and Ecology of Hyaiella Texana N. Sp. (Crustacea: Amphipoda) from the Edwards Plateau of Texas,
W73-12900 2I

Sugar-Coated Daphnia: A Preservation Technique for Cladocera,
W73-12910 5A

CRYSTAL GROWTH
On The Number Distribution of Hail Growing in Updrafts,
W73-12602 2B

CULTURES
Identification of the Limiting Nutrient and Specific Growth Rate,
W73-12861 5C

The Mechanisms of Nitrogen Assimilation in Pseudomonads,
W73-12881 5C

CURRENT METERS
Observations of Intermediate and Small Scale Turbulent Water Motion in a Stratified Estuary (Parts I and II),
W73-12424 2L

Measurement of Currents in the Great Lakes,
W73-12741 2H

CUTTHROAT FLUMES
Generalized Discharge Relations for Cutthroat Flumes,
W73-12474 8B

CYANIDE
Neutralization of Metal Containing Wastes,
W73-12462 5D

CYANOPHYTA
Physiology and Cytological Chemistry of Blue-Green Algae,
W73-12845 5C

CYCLING NUTRIENTS
Aspects of the Biogeochemistry of Carbohydrates and Proteins in Aquatic Environments,
W73-12371 5C

A Mathematical Model of the Nutrient Dynamics of Phytoplankton in a Nitrate-Limited Environment,
W73-12915 5C

CYPRESS (BALD)
Effects of Aeration, Water Supply, and Nitrogen Source on Growth and Development of Tupelo Gum and Bald Cypress,
W73-12923 2I

CYTOLOGICAL STUDIES
Correlated Light and Electron Microscope Studies on Brown Algae. II. Physode Production in Dictyota,
W73-12388 5C

Physiology and Cytological Chemistry of Blue-Green Algae,
W73-12845 5C

Effect of Incubation Temperature on the Macromolecular and Lipid Content of the Phytoflagellate Ochromonas danica,
W73-12896 5C

CZECHOSLOVAKIA
Determination of Organic Substances in Industrial Effluents (Nektere moznosti stanoveni organickeho znecisteni odpadnich vod),
W73-12532 5A

DAM DESIGN
Stresses in the Body and Foundations of Prestressed Dams,
W73-12475 8A

DAM FAILURE
Buffalo Creek Dam Disaster: Why It Happened,
W73-12411 4C

DAM STABILITY
Stresses in the Body and Foundations of Prestressed Dams,
W73-12475 8A

DAMS
Spillway for Oakley Dam, Sangamon River, Illinois-Appendix A: Type 2 (Revised) Spillway,
W73-12582 8A

DAPHNIA
Sugar-Coated Daphnia: A Preservation Technique for Cladocera,
W73-12910 5A

ATA INTERPRETATION
Biological Effects of Artificial Destratification and Aeration in Lakes and Reservoirs-Analysis and Bibliography,
W73-12625 5C

Water Quality Determinations in the Virgin Islands from ERTS-A Data,
W73-12630 5A

ATA PROCESSING
Real-Time Interactive Instrumentation,
W73-12850 7A

Instrumental and Numerical Considerations for On-Line Interpretation of High Resolution Mass Spectral Data,
W73-12874 2K

Optimum Procedure for the Determination of Selenium in Biological Specimens Using Se-77m Neutron Activation,
W73-12876 5A

High Speed A-D Converters in a Memory Test System,
W73-12891 7C

An Approach to Hydrogeologic Investigations of River Alluvium by the Use of Computerized Data Processing Techniques,
W73-12942 2A

ATE TRANSMISSION
High Speed A-D Converters in a Memory Test System,
W73-12891 7C

DD
DDT in Some New Zealand Marine and Freshwater Fauna,
W73-12925 5A

DE
Biologically Active Compounds in the Aquatic Environment: The Uptake and Distribution of (1,1-Dichloro-2,2-Bis (P-Chlorophenyl) Ethylene), DDE by Chironomus tentans Fabricius (Diptera: Chironomidae),
W73-12804 5B

DDT in Some New Zealand Marine and Freshwater Fauna,
W73-12925 5A

DT
PCBs and DDT,
W73-12402 5C

Long-Lived Pollutants in Sediments From the Laguna Atascosa National Wildlife Refuge, Texas,
W73-12595 5B

DDT in Some New Zealand Marine and Freshwater Fauna,
W73-12925 5A

DT RESIDUES
DDT Residues in White Croakers,
W73-12835 5C

EBRIS AVALANCES
Catastrophic Rock Slide, Mount Huascaran, North-Central Peru, May 31, 1970,
W73-12409 2J

ECISION MAKING
Heuristic Ranking and Prioritizing Under Subjective Conductions,
W73-12470 6B

New Techniques for Participative Planning in Water Resources,
W73-12472 6B

Water Resource Decison Making--How Effective is the Public Input,
W73-12693 6B

Public Land Use Policy: Needs, Objectives, and Guidelines,
W73-12697 4A

The Development of a Regional Systems Oriented Water Management Model: A Tool for Policy Analysis,
W73-12839 6A

Annual Literature Review: Administration, Systems Analysis,
W73-12840 5G

DECOMPOSING ORGANIC MATTER
The Kinetics of Microbiological Modification of Organic Substances in Natural Waters,
W73-12712 5B

DEFICIENT ELEMENTS
A Study of Inorganic Salts Requirements and Effect on the Morphology of Marine Bacteria,
W73-12628 5C

A Mathematical Model of the Nutrient Dynamics of Phytoplankton in a Nitrate-Limited Environment,
W73-12915 5C

DEGRADATION (DECOMPOSITION)
Energetics of Natural Populations of Freshwater Macroconsumers,
W73-12374 5C

DEGRADATION RATE (HERBICIDES)
The Effect of Adsorbents on the Rate of Degradation of Herbicides Incubated with Soil,
W73-12656 5B

DEHYDRATION
Water Metabolism in Desert Sheep, Effects of Various Degrees of Water Restriction on the Distribution of Body Water in Mariwari Sheep,
W73-12788 3F

DELAWARE
Geohydrology of the Dover Area, Delaware,
W73-12425 7C

Final Environmental Statement: Small Beach Erosion Control Project, Broadkill Beach, Delaware.
W73-12430 8B

Trace Metal Baseline Studies on the Murderkill and St Jones Rivers, Delaware Coastal Plain,
W73-12959 5B

DELAWARE BAY
Biogeochemistry of Sediments of Delaware Bay,
W73-12739 2L

DELAWARE ESTUARY
Delaware Estuary, Pennsylvania, New Jersey, and Delaware, Long-Range Dredged Spoil Disposal Problem.
W73-12560 5E

DELAWARE RIVER
Biogeochemistry of Sediments of Delaware Bay,
W73-12739 2L

DELTAS
Sea Floor Off Magdalena Delta and Santa Marta Area, Colombia,
W73-12591 2J

Computer Models of Delta Growth Due to Sediment Input From Rivers and Longshore Transport,
W73-12592 2J

DEMETHYLATION
Degradation of Methylmercury by Bacteria Isolated from Environmental Samples,
W73-12620 5A

DEMINERALIZATION
Ion Exchange Color and Mineral Removal from Kraft Bleach Wastes,
W73-12522 5D

DEMONSTRATION WATERSHEDS
A Treatment Prescription for Improving Big Game Habitat in Ponderosa Pine Forests,
W73-12406 4D

DENMARK
The Influence of Vegetation on the Redox Profile in the Sediment of Grane Langso, A Danish Lobelia Lake,
W73-12379 5C

DENTAL CARIES
Effect of School Water Fluoridation on Dental Caries: Final Results in Elk Lake, Pa., After 12 years,
W73-12647 5C

DENTAL PRACTICES
Impact of Water Fluoridation on Dental Practice and Dental Manpower,
W73-12816 5F

DENVER (COLO)
Evaluation of Urban Water Management Policies in the Denver Metropolitan Area,
W73-12510 5G

DESALINATION
Ion Exchange Color and Mineral Removal from Kraft Bleach Wastes,
W73-12522 5D

DESALINATION APPARATUS
Heat-Exchanger for Desalting Sea Water,
W73-12453 3A

DESERT PLANTS
The Interrelationships of the Vegetation Characters of Four Salt Desert Shrub Associations of Colorado Plateau,
W73-12791 3B

Welwitschia Mirabilis: Paradox of the Namib Desert,
W73-12796 2I

DESIGN
Design of Trapnet with Interchangeable Parts for the Capture of Large and Small Fishes from Varying Depths,
W73-12899 8I

DESIGN CRITERIA
Graphic Displays for Process Insight,
W73-12617 7B

DETECTION LIMITS
Sensitivity and Detectability Limits for Elemental Analysis by Proton-Induced X-Ray Fluorescence with a 3 Mv Van de Graaff,
W73-12935 5A

DETERGENTS
Process of Treating and Purifying Sewage, Particularly of Sewage Contaminated with Detergents,
W73-12458 5D

Bacterial Degradation of Detergent Compounds,
W73-12938 5B

DETRITIVORES
The Utilization of Leaf Litter by Stream Detritivores,
W73-12882 5C

DETRITUS
Energetics of Natural Populations of Freshwater Macroconsumers,
W73-12374 5C

DETRIVORES
Energetics of Natural Populations of Freshwater Macroconsumers,
W73-12374 5C

DEUTERIUM
Tritium and Deuterium Content of the Snow in Groenland,
W73-12418 5B

DEWATERING
An Efficient Method of Dewatering Effluent Sediments (Effektivnyi Sposob Obezvozhivaniya Osadkov Stochnikh Vod),
W73-12674 5E

DIAMOND DRILL BITS
Diamond-Bit Research Provides Basic Drilling Parameters,
W73-12764 8B

DIATOMS
Studies on the Growth of Phaeodactylum Tricornutum. II. The Effect of Organic Substances on Growth,
W73-12389 5C

Diatom Population Dynamics in a Central Iowa Drainage Ditch,
W73-12665 5C

Some Marine Diatoms from the Galapagos Islands,
W73-12902 2I

DICTOYOTA
Correlated Light and Electron Microscope Studies on Brown Algae. II. Physode Production in Dictyota,
W73-12388 5C

DIESEL FUEL
The Effects of Diesel Fuel on a Stream Fauna,
W73-12997 5C

DIGITAL COMPUTERS
Real-Time Interactive Instrumentation,
W73-12850 7A

DIGITAL TO ANALOG CONVERTERS
Boost A/D Rates with Staggered Operation,
W73-12893 7C

DIGITARIA
Resistance in Digitaria to Yellow Sugarcane Aphid, Siphaflava (Forbes) as Related to Temperature and Rainfall,
W73-12643 2I

DISASTERS
Catastrophic Rock Slide, Mount Huascaran, North-Central Peru, May 31, 1970,
W73-12409 2J

DISCHARGE MEASUREMENT
Prediction of Mixing Lengths for River Flow Gaging,
W73-12414 5B

Generalized Discharge Relations for Cutthroat Flumes,
W73-12474 8B

DISCHARGE (WATER)
Selection of a Suitable System of Effluent Purification (O vybore ratsional'noi sistemy ochistki stochnykh vod),
W73-12673 5D

DISINFECTION
Disinfection of Sewage Effluents,
W73-12504 5D

DISPERSION
The Effect of Longitudinal Dispersion on the Deoxygenation Rate in Polluted Streams,
W73-12714 5B

Delayed Seed Dispersal and Rapid Germination as Survival Mechanisms of the Desert Plant Blepharis Persica (Burm.) Kuntze,
W73-12787 2I

DISPLAY SYSTEMS
Graphic Displays for Process Insight,
W73-12617 7B

DISPOSAL
Disposal of Dredge Spoil; Problem Identification and Assessment and Research Program Development,
W73-12573 4A

Survey of Industrial Waste Injection Wells, Volume II,
W73-12576 5E

DISSOLVED IRON CONTENT
Corrosion Monitoring Method Reduces Effect of Variables in Analyzing Oil Field Waters,
W73-12767 8G

DISSOLVED ORGANIC MATTER
An Improved Method For Determining Organics by Activated Carbon Adsorption and Solvent Extraction - Pt. II (Test Method),
W73-12866 5A

DISSOLVED OXYGEN
Particulate Manganese in Sea Water Stressing Regimes in Marine Anoxic Basins,
W73-12854 5A

Sodium Tungsten Bronze as a Potentiometric Indicating Electrode for Dissolved Oxygen in Aqueous solution,
W73-12873 5A

DISTILLATION
High-Purity Distilled Water Producing Apparatus,
W73-12450 3A

DISTRIBUTION
Investigation of the Environmental Factors Which Affect the Anaerobic Decomposition of Fibrous Sludge Beds on Stream Bottoms,
W73-12936 5B

DISTRIBUTION PATTERNS
The Zooplankton of the Gulf of Guinea,
W73-12623 5A

Particulate Manganese in Sea Water Stressing Regimes in Marine Anoxic Basins,
W73-12854 5A

Community Structure of the Benthos in Scottish Sea-Lochs. II. Spatial Pattern,
W73-12855 5C

DISTRIBUTION PATTERNS (FAUNA)
The Distribution of Stream-Dwelling Triclads (Platyhelminthes) in North Wales,
W73-12971 2I

DISTRICT OF COLUMBIA
Survey of Water Transportation Potential to Reduce Congestion and Pollution in Washington, D.C. and Other Major Cities.
W73-12363 5G

Activated Sludge Treatment with Oxygen,
W73-12586 5D

DOCKS
Effects of Proposed Dock Expansion at Newport News on Tides, Currents, and Shoaling; Hydraulic Model Investigation,
W73-12566 8B

DOCUMENTATION
Biological Effects of Artificial Destratification and Aeration in Lakes and Reservoirs-Analysis and Bibliography,
W73-12625 5C

Biological Effects of Oil Pollution - Selected Bibliography II,
W73-12626 5C

Total Mercury Analysis: Review and Critique,
W73-12885 5A

Analytical Reviews 1973/Applications.
W73-12930 5A

DOMESTIC WASTES
Tertiary Treatment of Combined Domestic and Industrial Wastes,
W73-12512 5D

DON RIVER
Investigation of Thermal Properties of Soils in the Don River Basin for Estimation of Snowmelt Losses to Infiltration Into Frozen Soil (Issledovaniye teplovykh svoystv pochv basseyna r. Dona dlya otsenki poter' talykh vod na in fil'tratsiyu v merzluyu pochvu),
W73-12436 2G

Factors Producing the Outstanding Spring Flood of 1970 in Upper Don River Basins (Usloviya formirovaniya vydayushchegosya vesennego polovod'ya 1970 g. v basseynakh rek verkhnego Dona),
W73-12440 2E

Results of a Study of Water Regime of Soils on Small Watersheds in the Don River Basin (Rezul'taty izucheniya vodnogo rezhima pochv malykh vodosborov v basseyne r. Dona),
W73-12441 2G

Some Hydrophysical Characteristics of Soils in the Don River Basin to Kazanskaya Station (Nekotoryye vodno-fizicheskiye kharakteristiki pochv basseyna r. Dona do st-tsy Kazanskoy),
W73-12443 2G

DOUGLAS-FIR
Average Bowen-Ratio Methods of Calculating Evaportranspiration Applied to a Douglas Fir Forest,
W73-12801 2D

DOVER (DEL)
Geohydrology of the Dover Area, Delaware,
W73-12425 7C

DRAINAGE
Regional Utilities Study: Drainage Volume of Technical Appendix.
W73-12368 4A

DRAINAGE AREA
Hydrologic Models for Poorly Defined Drainage Areas,
W73-12496 2A

DRAINAGE DITCHES
Diatom Population Dynamics in a Central Iowa Drainage Ditch,
W73-12665 5C

DRAINAGE PATTERNS (GEOLOGIC)
A Topologically Optimum River Sampling Plan for South Carolina,
W73-12498 5B

A Suggested New Approach to the Analysis of Drainage Basin Shapes,
W73-12729 4A

Some Examples of Drainage Component Analysis,
W73-12734 4A

A Note on Stream Ordering,
W73-12735 4A

DRAINAGE PROGRAMS
Regional Utilities Study: Drainage Volume of Technical Appendix.
W73-12368 4A

DRAINAGE SYSTEMS
Considerations for Effective Sloping Land Drainage Systems,
W73-12933 4A

DRAINAGE WATER
The Quality of Drainage Water from Irrigated Black Cotton Soils for Irrigation,
W73-12650 3F

DRAINAGE WELLS
Poliovirus in a Water Supply,
W73-12922 5B

DRAWDOWN
Water Levels Near a Well Discharging From an Unconfined Aquifer,
W73-12777 4B

Flow to Wells Near Streams in the Presence of Delayed Yield From Storage and Analysis of Pumping Test Data,
W73-12943 4B

DREDGE SPOIL
Disposal of Dredge Spoil; Problem Identification and Assessment and Research Program Development,
W73-12573 4A

DREDGING
Delaware Estuary, Pennsylvania, New Jersey, and Delaware, Long-Range Dredged Spoil Disposal Problem.
W73-12560 5E

Disposal of Dredge Spoil; Problem Identification and Assessment and Research Program Development,
W73-12573 4A

Maintenance of the Hudson River Channel, New York, Navigation Project, (Final Environmental Statement).
W73-12588 8B

DRIFT
Microdistribution and Density as Factors Affecting the Downstream Drift of Mayflies,
W73-12888 2I

DRIFT (ORGANIC)
The Influence of Organic Drift on the Food Habits and Life History of the Yellowfin Shiner, Notropis Lutipinnis (Jordan and Brayton),
W73-12844 2I

DROUGHT RESISTANCE
Cenchrus Ciliaris--A Perennial Pasture Grass of Arid and Semi-Arid Areas,
W73-12790 4A

DROUGHT TOLERANCE
Water Metabolism in Desert Sheep, Effects of Various Degrees of Water Restriction on the Distribution of Body Water in Mariwari Sheep,
W73-12788 3F

DUCTILITY
High Strength Bolted Galvanized Joints,
W73-12489 8G

DUSTING
Electrostatic Crop Spraying,
W73-12482 3F

E. COLI
ATP Pools in Pure and Mixed Cultures,
W73-12887 5A

EARTH DAMS
Simplified Calculation of Embankment Deformations,
W73-12473 8D

EAST AFRICA FEEDING HABITS (FISH)
The Food and Feeding Habits of the Small Mormyrid Fishes of Lake Victoria, East Africa,
W73-12641 2H

EAST PAKISTAN
Effect of Level of Soil Moisture on Nitrogen Mineralization and Nitrification During Incubation of East Pakistan Tea Soils,
W73-12799 3F

EAST SIBERIA
Hydrochemical Description of the Onon-Argun' Steppe (Gidrokhimicheskaya kharakteristika Onon-Argunskoy stepi),
W73-12746 2K

ECOLOGICAL DISTRIBUTION
Dispersion, Dispersal, and Persistence of the Annual Intertidal Alga, Postelsia Palmeformis Ruprecht,
W73-12883 5C

Ecological Studies of Codium fragile in New England, USA,
W73-12918 5C

ECOLOGY
Mathematical Models in Ecology, Proceedings of the 12th Symposium.
W73-12653 6A

Description and Ecology of Hyaiella Texana N. Sp. (Crustacea: Amphipoda) from the Edwards Plateau of Texas,
W73-12900 2I

Ecological Studies of Codium fragile in New England, USA,
W73-12918 5C

ECONOMETRICS
Evaluation of the Economic Effects of Anti-Pollution Public Policy,
W73-12684 6B

ECONOMIC DEVELOPMENT
Peruvian Fisheries: Conservation and Development.
W73-12689 6B

ECONOMIC EFFICIENCY
Problems of Environmental Economics.
W73-12675 6B

Anti-Pollution Policy and Cost Allocation: The Issues in Practice,
W73-12677 6B

Economics in Soil and Water Conservation,
W73-12691 3F

Externalities, Welfare, And the Feasibility of Corrective Taxes,
W73-12694 6B

ECONOMIC FEASIBILITY
Advanced Pollution Abatement Technology in the Pulp and Paper Industry.
W73-12552 5D

ECONOMIC IMPACT
Economic and Related Impacts of Rural Water Systems in Mississippi,
W73-12493 6B

Evaluation of the Economic Effects of Anti-Pollution Public Policy,
W73-12684 6B

Peruvian Fisheries: Conservation and Development.
W73-12689 6B

Antipollution Policies, Their Nature and Their Impact on Corporate Profits,
W73-12695 5G

A Study of the Economic Impact on the Steel Industry of the Costs of Meeting Federal Air and Water Pollution Abatement Requirements. Part I - Executive Summary.
W73-12707 5G

Impact of Costs Associated with New Environmental Standards Upon the Petroleum Refining Industry. Part I. The Impact of Environmental Control Costs.
W73-12708 5G

A Descriptive Analysis of the Bakery Products Industry Detailing Industry Trends and Characteristics Relevant to Economic Impact Analysis of Environmental Standards. Part II.
W73-12709 5G

A Study of the Impact of Pollution Standards and Charges on the Bakery Industry. Part III.
W73-12710 5G

ECONOMICS
Problems of Environmental Economics.
W73-12675 6B

Extinction of a Fishery by Commercial Exploitation: A Note,
W73-12692 6B

EDAPHIC RELATIONSHIPS
Edaphic and Water Relationships of Aldicarb and its Metabolites,
W73-12979 2G

EDDIES
Outlet Works Stilling Basin for Tallahala Dam, Tallahala Creek, Mississippi; Hydraulic Model Investigation,
W73-12568 8B

EDISTO RIVER (SC)
A Topologically Optimum River Sampling Plan for South Carolina,
W73-12498 5B

EELGRASS
Fouling on Eelgrass (Zostera Marina L.),
W73-12631 5G

EFFICIENCIES
Quantitative Sampling of Live Zooplankton With a Filter-Pump System,
W73-12911 5A

ELASTIC DEFORMATION
Simplified Calculation of Embankment Deformations,
W73-12473 8D

ELECTRICAL WELL LOGGING
Physical Characteristics of Basalt Aquifers,
W73-12523 4B

ELECTRICITY
Electrical Stimulation of Microbial Waste Treatment,
W73-12503 5D

ELECTROCHEMISTRY
Voltammetric Study of the Hydrogen Ion/Hydrogen Couple in Acetonitrile/Water Mixtures,
W73-12872 2K

ELECTRODES
A Simple Method for Recording Fish Heart and Operculum Beats Without the Use of Implanted Electrodes,
W73-12858 7B

ELECTRONIC EQUIPMENT
An Electric Conversion for Mechanical Hydraulic Governors of Water Wheel Turbines,
W73-12469 8C

ELECTROSTATICS
Electrostatic Crop Spraying,
W73-12482 3F

EMBANKMENT
Simplified Calculation of Embankment Deformations,
W73-12473 8D

EMISSION SPECTROSCOPY
Particulate Manganese in Sea Water Stressing Regimes in Marine Anoxic Basins,
W73-12854 5A

EMULSIFIERS
Vessel for the Removal of Oil on Water,
W73-12448 5G

ENERGY
Energy Method for Computing the Amplitude of Vibration of Conductor Bundles Due to Wake Effect,
W73-12480 8C

ENERGY BUDGET
Energetics of Natural Populations of Freshwater Macroconsumers,
W73-12374 5C

ENGINEERING EDUCATION
Encourage Applied Research and Publish the Findings,
W73-12758 5G

ENGINEERING STRUCTURES
Tests of Selected Insulating Materials for Mass Concrete,
W73-12431 8F

ENGLAND
The Growth, Reproduction and Food of the Roach Rutilus rutilus (L.), of the River Lugg, Herefordshire,
W73-12921 8I

ENGLAND (LYMINGTON ESTUARY)
Bacteria of Muds Colonized by Spartina Townsendii and their Possible Role in Spartina Die-Back,
W73-12705 2L

ENTRANCE VELOCITY
Rational Design of Well Screens,
W73-12771 8B

ENUMERATION
Microbiology in the Aerobic Treatment of Farm Waste,
W73-12890 5D

ENVIRONMENT
Problems of Environmental Economics.
W73-12675 6B

Environmental Policy Issues: Real and Fictitious,
W73-12676 6B

Antipollution Policies, Their Nature and Their Impact on Corporate Profits,
W73-12695 5G

Mathematical Modeling for Environmental Pollution Control,
W73-12711 5G

ENVIRONMENTAL CONTROL
Environmental Impact Study.
W73-12580 5G

Multiple-Use Problems in the Great Lakes.
W73-12960 6B

Toward a Regional Policy for the Great Lakes,
W73-12963 6B

The Planning Viewpoint,
W73-12964 6B

An Industrial Point of View-1970,
W73-12965 6B

ENVIRONMENTAL EFFECTS
Disposal of Dredge Spoil; Problem Identification and Assessment and Research Program Development,
W73-12573 4A

California Power Plant Siting Study: Volumes, I, II, and III.
W73-12574 5G

Environmental Contamination by Toxic Metals,
W73-12605 5B

Biological Effects of Artificial Destratification and Aeration in Lakes and Reservoirs-Analysis and Bibliography,

Description and Ecology of Hyaiella Texana N. Sp. (Crustacea: Amphipoda) from the Edwards Plateau of Texas,
W73-12900 2I

HYDRASIEVE
Demostration of a Waste Disposal System for Livestock Waste,
W73-12517 5D

HYDRAULIC CONDUCTIVITY
Nomograph for Hydraulic Conductivity and Intrinsic Permeability of Water-Soil System,
W73-12808 2G

Germination of Wheat as Affected by Soil Water Stress,
W73-12884 3F

HYDRAULIC ENGINEERING
Estuarine Navigation Projects.
W73-12575 8B

HYDRAULIC-FRACTURING
Sand Control - 3. Chemical Consolidation,
W73-12760 8G

HYDRAULIC GATES
Large Hydraulic Gates and Valves in the Snowy Mountain Scheme--A Review of Practice,
W73-12476 8C

HYDRAULIC LIFT
Diamond-Bit Research Provides Basic Drilling Parameters,
W73-12764 8B

HYDRAULIC MODELS
Reflection Characteristics of Screen Wave Absorbers; Hydraulic Model Investigation,
W73-12561 8B

Wave Transmission Through Rock Structures; Hydraulic Model Investigation,
W73-12563 8B

Wave Damping Effects of Fibrous Screens; Hydraulic Model Investigation,
W73-12564 8B

Effects of Proposed Dock Expansion at Newport News on Tides, Currents, and Shoaling; Hydraulic Model Investigation,
W73-12566 8B

Sea-Land Navigation Studies; Hydraulic Model Investigation,
W73-12567 8B

Outlet Works Stilling Basin for Tallahala Dam, Tallahala Creek, Mississippi; Hydraulic Model Investigation,
W73-12568 8B

Selective Withdrawal from Man-Made Lakes, Hydraulic Laboratory Ivestigation,
W73-12569 4A

HYDRAULIC MODELS

Shoaling Conditions, St. Louis Harbor, Mississippi River; Hydraulic Model Investigation,
W73-12570 8B

Navigation Channel Improvement, Gastineau Channel, Alaska; Hydraulic Model Investigation,
W73-12571 8A

Effects of Submerged Sills in the St. Clair River; Hydraulic Model Investigation,
W73-12572 8B

HYDRAULIC PROPERTIES

Evaluation of Hydraulic Properties of Rock Masses Influenced by Major Heterogeneities,
W73-12468 8E

HYDRAULIC TURBINES

An Electric Conversion for Mechanical Hydraulic Governors of Water Wheel Turbines,
W73-12469 8C

Turbine Design and Performance for the Mersey-Forth Hydro Power Development,
W73-12486 8C

HYDRAULIC VALVES

Large Hydraulic Gates and Valves in the Snowy Mountain Scheme--A Review of Practice,
W73-12476 8C

HYDRAULICS

Computer Determination of Critical Depth Control Points in Open Channel Flow,
W73-12483 8B

Simplified Solution for Decreasing Flow in Wells,
W73-12759 8B

Rational Design of Well Screens,
W73-12771 8B

HYDRO CARBONS

Photosulfoxidation of Hydrocarbons in the Liquid Phase,
W73-12833 2K

HYDROGEN ION CONCENTRATION

Neutralization of Metal Containing Wastes,
W73-12462 5D

Disinfection of Sewage Effluents,
W73-12504 5D

HYDROGEN SULFIDE

Particulate Manganese in Sea Water Stressing Regimes in Marine Anoxic Basins,
W73-12854 5A

HYDROGEOLOGY

Geohydrology of the Dover Area, Delaware,
W73-12425 7C

Presidio Bolson, Trans-Pecos Texas and Adjacent Mexico: Geology of a Desert Basin Aquifer System,

LAKES
Finite Element Shallow Lake Circulation Analysis,
W73-12413 2H

The Shagawa Lake Project: Lake Restoration by Nutrient Removal from Wastewater Effluent,
W73-12520 5D

Selective Withdrawal from Man-Made Lakes, Hydraulic Laboratory Ivestigation,
W73-12569 4A

Biological Effects of Artificial Destratification and Aeration in Lakes and Reservoirs-Analysis and Bibliography,
W73-12625 5C

Radiation Regime of Lake Chelkar and Adjoining Regions (O radiatsionnom rezhime ozera Chelkar i prilegayushchey k nemu territorii),
W73-12724 2H

Investigation of Lake-Level Fluctuation Patterns and Moisture Conditions in the Middle and Southern Urals (Issledovaniye zakonomernostey kolebaniy urovnya ozer i uvlazhnennosti Srednego i Yuzhnogo Urala),
W73-12725 2H

LAND APPRAISALS
Stream Quality Preservation Through Planned Urban Development,
W73-12518 5G

LAND DEVELOPMENT
Standards for Soil Erosion and Sediment Control in New Jersey.
W73-12956 2J

LAND DISPOSAL
Land Disposal of Liquid Sewage Sludge: I. The Effect on Yield, in Vivo Digestibility, and Chemical Composition of Coastal Bermudagrass (Cynodon dactylon L. Pers.),
W73-12914 5D

LAND DRAINAGE (SLOPING)
Considerations for Effective Sloping Land Drainage Systems,
W73-12933 4A

LAND FORMING
Process-Form Variability of Multiclass Coasts: Baja California,
W73-12422 2L

Leaching Salty Soils,
W73-12789 2G

LAND RECLAMATION
Influence of Land Reclamation and Waste Water from Paper Mill on Environment of 'Nori' (Porphyra Tenera) Culture Farm, (In Japanese),
W73-12639 5C

LAND RESOURCES
The Visual Aspects of Resource Management,
W73-12407 4D

LAND USE
An Evaluation of Baltimore Harbor Land Use Potentials,
W73-12361 6B

The Lakefront Plan of Chicago.
W73-12367 4C

Stream Quality Preservation Through Planned Urban Development,
W73-12518 5G

Public Land Use Policy: Needs, Objectives, and Guidelines,
W73-12697 4A

LAND USE POLICY
Public Land Use Policy: Needs, Objectives, and Guidelines,
W73-12697 4A

LANDSCAPING
The Visual Aspects of Resource Management,
W73-12407 4D

Measuring Public Responses to Vegetative Management,
W73-12408 4D

LANDSLIDES
Catastrophic Rock Slide, Mount Huascaran, North-Central Peru, May 31, 1970,
W73-12409 2J

LARGEMOUTH BASS
The Seasonal Abundance of the Ancyrocephalinae (Monogenea) on Largemouth Bass in Walter F. George Reservoir,
W73-12978 2H

LAW ENFORCEMENT
Ontario Unhappy with Efforts of Industry to Halt Pollution,
W73-12538 5G

LEACHING
Field Leaching by Sprinkler and Surface Irrigation During a Crop Season,
W73-12464 3F

Leaching Salty Soils,
W73-12789 2G

LEAD
Lead Pollution: Records in Southern California Coastal Sediments,
W73-12589 5B

Biological Aspects of Lead: An Annotated Bibliography - Literature From 1950 through 1964. Parts I and II,
W73-12627 5C

Determination of Lead in Petroleum Additives Using Atomic Absorption Spectrophotometry,
W73-12864 5A

An Improved AA Microsampling System,
W73-12865 5A

LEAD RADIOISOTOPES
Biological Aspects of Lead: An Annotated Bibliography - Literature From 1950 through 1964. Parts I and II,
W73-12627 5C

LEAF LITTER
The Utilization of Leaf Litter by Stream Detritivores,
W73-12882 5C

LEAF WATER POTENTIAL
Diurnal and Seasonal Effects of Environment on Plant Water Relations and Fruit Diameter of Citrus,
W73-12805 3F

Evaluation of Tensiometers for Estimating Plant Water Stress in Citrus,
W73-12985 3F

LEAKY AQUIFERS
Evaluation of a Shallow Leaky Water Table Aquifer in a Subhumid Region of France,
W73-12941 2F

LEAST-COST ANALYSIS
Identification and Achievement of Environmental Quality Levels in Managing the Use of Natural Resources,
W73-12696 5G

LEAVES
Water Pathways in Higher Plants: III. The Transpiration Stream Within Leaves,
W73-12652 2I

Welwitschia Mirabilis: Paradox of the Namib Desert,
W73-12796 2I

Relative Water Content of Leaves: Underestimation Caused by Antitranspirant Film,
W73-12994 2D

LEGAL ASPECTS
Selection of a Suitable System of Effluent Purification (O vybore ratsional'noi sistemy ochistki stochnykh vod),
W73-12673 5D

LEGISLATION
Public Land Use Policy: Needs, Objectives, and Guidelines,
W73-12697 4A

LEMMON VALLEY (NEV)
Evaluation of the Water Resources of Lemmon Valley, Washoe County, Nevada, With Emphasis on Effects of Ground-Water Development to 1971,
W73-12718 4B

LENGTH-WEIGHT RATIOS (FISH)
Length-Weight Relationship and Condition Factors of Fishes From a South Carolina Reservoir Receiving Thermal Effluent,
W73-12774 5C

LEVEES
Chena River Lakes Project, Alaska, Problems Relating to Channel Development, Erosion, and Bank and Levee Protection,
W73-12559 8B

Control of Underseepage by Relief Wells, Trotters, Mississippi; Appendix K: 1969 Pumping Tests,
W73-12597 8B

LICHEN
Simplification of the Blue Mountain Lichen Communities Near a Zinc Factory,
W73-12973 5C

LIFE CYCLES
Annual Life Cycle and Production of the Chaetognath Sagitta elegans in Bedford Basin, Nova Scotia,
W73-12898 5B

LIGHT
Effects of Light and Temperature on Algal Growth,
W73-12396 5C

LIGHT PENETRATION
Optical Properties and Color of Lake Tahoe and Crater Lake,
W73-12926 5A

LIGNIN
Selection of a Suitable System of Effluent Purification (O vybore ratsional'noi sistemy ochistki stochnykh vod),
W73-12673 5D

LIME
Practical Decolorization of Kraft Mill Effluents (Praktyka usuwania barwy sciekow posiarczanowych),
W73-12544 5D

LIME SLUDGES
Study of Utilization and Disposal of Lime Sludges Containing Phosphates,
W73-12501 5D

LIMESTONES
Hydraulics of Sheetlike Solution Cavities,
W73-12944 4B

LIMITING FACTORS
The Effect of Inorganic Carbon on Eutrophication,
W73-12392 5C

Phosphorus and Eutrophication,
W73-12394 5C

Identification of the Limiting Nutrient and Specific Growth Rate,
W73-12861 5C

Ecological Studies of Codium fragile in New England, USA,
W73-12918 5C

Phytoplankton Algae: Nutrient Concentrations and Growth,
W73-12924 5C

LINDANE
DDT in Some New Zealand Marine and Freshwater Fauna,
W73-12925 5A

LINURON
Simultaneous Detection of the Residues of Atrazine and Linuron in Water, Soil, Plant, and Animal Samples by Thin-layer Chromatography,
W73-12811 5A

LIPIDS
Lipids in Shallow Bottom Sediments,
W73-12717 5B

LIQUID CHROMATOGRAPHY
Application of Liquid Chromatography to Pollution Abatement Studies of Munition Wastes,
W73-12877 5A

LIQUID SCINTILLATION
A Comparison of Liquid Scintillation and Geiger-Muller Estimates of Primary Productivity in an in Situ Experiment,
W73-12848 5A

An Evaluation of Liquid Scintillation Counting Techniques for Use in Aquatic Primary Production Studies,
W73-12907 5A

LIQUID WASTES
Cross-Flow Filtration Process for Removal of Total Organic Carbon and Phosphates from Aqueous Sewage Effluents,
W73-12460 5D

LITTORAL DRIFT
Forecasting Storm-Induced Beach Changes Along Virginia's Ocean Coast,
W73-12584 4A

LOBELIA
The Influence of Vegetation on the Redox Profile in the Sediment of Grane Langso, A Danish Lobelia Lake,
W73-12379 5C

LOCH CRERAN (SCOTLAND)
Community Structure of the Benthos in Scottish Sea-Lochs. II. Spatial Pattern,
W73-12855 5C

LOCH ETIVE (SCOTLAND)
Community Structure of the Benthos in Scottish Sea-Lochs. II. Spatial Pattern,
W73-12855 5C

LODZ (POLAND)
Construction Costs of Water Supply and Sewage Networks in Poland--1961-1970,
W73-12703 6C

LOGGING
Well Logs can Indicate Formation Drillability,
W73-12769 8E

LOUISIANA
Aqueous Iron-Sulfur Systems in Rice Field Soils of Louisiana,
W73-12385 3F

Mariculture in Estuarine Oil-Pipeline Canals in Louisiana,
W73-12951 5C

Standing Crops of Natural Fish Populations in Brackish-Water Oil Field Pipeline Canals,
W73-12952 5C

LOW ALLOY STEELS
Welding of a Normalized High Strength Low Alloy Plate Steel of Structural Quality,
W73-12466 8G

LUMBERING
Valuation of Timber, Forage and Water from National Forest Lands,
W73-12701 6B

LYSIMETERS
Application of Acrylic Plastic Tension Lysimeters to Sloping Land,
W73-12638 2G

MACROCONSUMERS
Energetics of Natural Populations of Freshwater Macroconsumers,
W73-12374 5C

MACROINVERTEBRATES
Community Structure of the Benthos in Scottish Sea-Lochs. II. Spatial Pattern,
W73-12855 5C

Biomass Characteristics of the Asidian Molgula Manhattensis (Dekay),
W73-12880 5A

MACROPHYTES
The Physiognomy and Structure of the Benthic Macrophyte Communities on Rocky Shores in the Southwestern Archipelago of Finland (Seili Islands),
W73-12929 5A

MAGNESIUM
Effect of Quality of Well Waters on the Germination and Mineral Composition of Wheat on Saline-Sodic Soils Rich in Magnesium,
W73-12809 3C

MAGNESIUM CARBONATE
Determination of Exchangeable Cations in Calcareous Soils,
W73-12786 2G

MAGNETIC FIELDS
Possibilities of Water Treatment by Means of a Magnetic Field,
W73-12481 5D

MAINE
History of Sedimentation in Montsweag Bay,
W73-12740 2L

MAIZE
Effect of Compaction on Yield and Uptake of N, P and K by Maize (Zea mays L.),
W73-12660 3F

MALAWI
The Lake Chilwa Tilapia and Its Fishery,
W73-12642 2H

MALFUNCTION
Detoxification of Kraft Pulp Mill Effluent by an Aerated Lagoon,
W73-12529 5D

MAMMALS
The Annual Cycle of Small Mammal Populations on a Zambian Floodplain,
W73-12814 2I

MANAGEMENT
Identification and Achievement of Environmental Quality Levels in Managing the Use of Natural Resources,
W73-12696 5G

Annual Literature Review: Administration, Systems Analysis,
W73-12840 5G

MANGANESE
Particulate Manganese in Sea Water Stressing Regimes in Marine Anoxic Basins,
W73-12854 5A

MAPS
Geohydrology of the Dover Area, Delaware,
W73-12425 7C

Horton's 1945 Study: A Cartobibliography,
W73-12596 7C

MARICULTURE STUDIES
Standing Crops of Natural Fish Populations in Brackish-Water Oil Field Pipeline Canals,
W73-12952 5C

MARINE ALGAE
Some Marine Diatoms from the Galapagos Islands,
W73-12902 2I

Ecological Studies of Codium fragile in New England, USA,
W73-12918 5C

Thorium in Water and Algae from the Adriatic Sea,
W73-12927 5A

MARINE ANIMALS
DDT in Some New Zealand Marine and Freshwater Fauna,
W73-12925 5A

MARINE BACTERIA
Selective Substrate Utilization by Marine Hydrocarbonoclastic Bacteria,
W73-12621 5B

A Study of Inorganic Salts Requirements and Effect on the Morphology of Marine Bacteria,
W73-12628 5C

Bacterial Content of Particulate Matter in Offshore Surface Waters,
W73-12912 5B

MARINE ENVIRONMENT
The Physiognomy and Structure of the Benthic Macrophyte Communities on Rocky Shores in the Southwestern Archipelago of Finland (Seili Islands),
W73-12929 5A

MARINE FISH
Design of Trapnet with Interchangeable Parts for the Capture of Large and Small Fishes from Varying Depths,
W73-12899 8I

MARINE HABITATS
The Association of Amphipods in the Shallow-Water Sand Habitat of Strangford Lough, Co. Down,
W73-12879 5A

MARINE ORGANISMS
Aqualculutre: The Farming and Husbandry of Freshwater and Marine Organisms,
W73-12830 3F

MARINE PLANTS
The Physiognomy and Structure of the Benthic Macrophyte Communities on Rocky Shores in the Southwestern Archipelago of Finland (Seili Islands),
W73-12929 5A

MARION LAKE (BRITISH COLUMBIA)
Some Effects of Artificial Fertilization on Enclosed Plankton Populations in Marion Lake, British Columbia,
W73-12384 5C

MARKET VALUE
The Set up of the Statistical System Within Which the Deterioration of the Human Environment will be Estimated,
W73-12681 6B

MARKING (FISH BRANDING)
Use of Cold Brands on Channel Catfish,
W73-12778 8I

MARSH PLANTS
The Sediments and History of Lake Butte des Morts, Wisconsin,
W73-12355 2J

MARSHES
Stratigraphy of Fossil Pigments as a Guide to the Postglacial History of Kirchner Marsh, Minnesota,
W73-12386 5C

MARYLAND
Regional Sewer System, Planning and Cost Estimation Model,
W73-12357 5G

Outdoor Recreation in the Baltimore Area.
W73-12360 6D

An Evaluation of Baltimore Harbor Land Use Potentials,
W73-12361 6B

Observations of Intermediate and Small Scale Turbulent Water Motion in a Stratified Estuary (Parts I and II),
W73-12424 2L

Hydrogeology of the Carbonate Rocks, Frederick and Hagerstown Valleys, Maryland,
W73-12719 4B

MASS SPECTOMETRY
Instrumental and Numerical Considerations for On-Line Interpretation of High Resolution Mass Spectral Data,
W73-12874 2K

MASSACHUSETTS
Lipids in Shallow Bottom Sediments,
W73-12717 5B

MATHEMATICAL ANALYSIS
Rational Design of Well Screens,
W73-12771 8B

MATHEMATICAL MODELS
Mathematical modeling of Phytoplankton Populations,
W73-12399 5C

Fluidized Bed Clarification as Applied to Wastewater Treatment,
W73-12505 5D

Coordination of Agricultural and Urban Water Quality Management in the Utah Lake Drainage Area,
W73-12508 5G

Mathematical Modeling of Water Management Strategies in Urbanizing River Basins,
W73-12509 5G

Evaluation of Urban Water Management Policies in the Denver Metropolitan Area,
W73-12510 5G

Recondition and Reuse of Organically Contaminated Waste Sodium Chloride Brines,
W73-12521 5D

Mathematical Simulation of the Turbidity Structure within an Impoundment; Hydraulic Laboratory Investigation,
W73-12562 8B

Wind-Driven Model for Evaporite Deposition in a Layered Sea,
W73-12594 2J

Mathematical Models in Ecology, Proceedings of the 12th Symposium.
W73-12653 6A

Outline of a Macro-Economic Analysis of Environmental Pollution: A Multi-Sectoral Approach,
W73-12683 6B

Evaluation of the Economic Effects of Anti-Pollution Public Policy,
W73-12684 6B

Externalities, Welfare, And the Feasibility of Corrective Taxes,
W73-12694 6B

Mathematical Modeling for Environmental Pollution Control,
W73-12711 5G

Prediction of Unsteady Salinity Intrusion in Estuaries: Mathematical Model and User's Manual,
W73-12728 2L

Identification of the Limiting Nutrient and Specific Growth Rate,
W73-12861 5C

A Mathematical Model of the Nutrient Dynamics of Phytoplankton in a Nitrate-Limited Environment,
W73-12915 5C

MATHEMATICAL STUDIES
Simplified Solution for Decreasing Flow in Wells,
W73-12759 8B

MATURITY
The Size at Maturity and Breeding Seasons of Sardines in Southern Lake Tanganyika,
W73-12649 2H

MAYAK
Mayak, Russian Wild Ryegrass,
W73-12974 4A

MAYFLIES
Microdistribution and Density as Factors Affecting the Downstream Drift of Mayflies,
W73-12888 2I

Annual Production of a Stream Mayfly Population: A Comparison of Methods,
W73-12905 5B

MEANDERS
River Channel Change With Time: An Example,
W73-12590 2J

The Superimposition Hypothesis for Incised Meanders--A General Rejecton and Specific Test,
W73-12736 2E

Climatic Change and Arrested Meander Development on the River Severn,
W73-12737 4A

MEASUREMENT
Identification and Measurement of Environmental Pollutants. Symposium.
W73-12655 5A

Peter Bohm.
W73-12680 6B

Membrane Filter Retention--A Source of Error in the C-14 Method of Measuring Primary Production,
W73-12908 5A

MEASUREMENTS
Effects of Air Gaps and Saturated Voids on Accuracy of Neutron Moisture Measurements,
W73-12636 2G

MELAMINE RESINS
Determination of Melamine-Formaldehyde Resin in White Waters (Opredelenie soderzhaniya melamino-formaldegidnoi smoly v podsetochnykh vodakh),
W73-12672 5A

MEMBRANE FILTERS
Membrane Filter Retention--A Source of Error in the C-14 Method of Measuring Primary Production,
W73-12908 5A

MERCURY
Process and Apparatus for Removing Mercury from Waste Water,
W73-12449 5D

Mercury Levels in Wisconsin Fish and Wildlife,
W73-12812 5A

Mercury in Fish: Some Toxicological Considerations,
W73-12826 5C

Uptake of Mercury by Caged Rainbow Trout (Salmo Gairdneri) in the South Saskatchewan River,
W73-12857 5C

Total Mercury Analysis: Review and Critique,
W73-12885 5A

Mercury Distribution in Estuarine-Nearshore Environment,
W73-12920 5B

Mercury in Canadian Fish,
W73-12970 5C

MERCURY CONTAMINATION
The Crayfish, Orconectes Virilis, As an Indicator of Mercury Contamination,
W73-12632 5A

METABOLISM
The Kinetics of Microbiological Modification of Organic Substances in Natural Waters,

The Monitoring of Organic Matter with Polyurethane Foam,
W73-12868 5A

ATP Pools in Pure and Mixed Cultures,
W73-12887 5A

An Immobilized Cholinesterase Product for Use in the Rapid Detection of Enzyme Inhibitors in Air or Water,
W73-12901 5A

MONOGENEA
The Seasonal Abundance of the Ancyrocephalinae (Monogenea) on Largemouth Bass in Walter F. George Reservoir,
W73-12978 2H

MONTSWEAG BAY (MAINE)
History of Sedimentation in Montsweag Bay,
W73-12740 2L

MORTALITY
The Utilization of Leaf Litter by Stream Detritivores,
W73-12882 5C

MORTALITY COEFFICIENTS
Estimation of Mortality Coefficients from Field Samples of Zooplankton,
W73-12906 5C

MOSQUITOES
Parasitism of Mosquitoes by Water Mites,
W73-12987 2I

MOSQUITOS
Ecological Information on the Differences in the Number of Culex tritaeniorhynchus Larvae Among Paddy Fields (In Japanese),
W73-12829 3F

MOSSES
Observations of Tufa Deposition,
W73-12730 2K

MOTIVATION
Measuring and Developing Methods of Attitude and Motivational Change in Implementing the Big Blue River Basin Water Plan,
W73-12491 6B

MOTTLE VIRUS
Viruses Infecting Peaches in the Murrumbidgee Irrigation Areas of New South Wales,
W73-12981 3F

MOUNTAINS
Investigation of Lake-Level Fluctuation Patterns and Moisture Conditions in the Middle and Southern Urals (Issledovaniye zakonomernostey kolebaniy urovnya ozer i uvlazhnennosti Srednego i Yuzhnogo Urala),
W73-12725 2H

Snow Cover of the Issyk-kul' Depression and Its Alpine Environment (Snezhnyy pokrov Issyk-Kul'skoy kotloviny i yeye vysokogornogo obramleniya),
W73-12726 2C

Karst of the Arabika Massif (Karst massiva Arabika),
W73-12742 2K

MT HUASCARAN
Catastrophic Rock Slide, Mount Huascaran, North-Central Peru, May 31, 1970,
W73-12409 2J

MUDS
Bacteria of Muds Colonized by Spartina Townsendii and their Possible Role in Spartina Die-Back,
W73-12705 2L

MULCH
Protein Content of Brown Rice by Upland Polyethylene Film Mulching Culture, (In Japanese),
W73-12806 3F

MULCHES
Stone and Woodchip Mulches for Erosion Control on Construction Sites,
W73-12463 4D

MULCHING
Stone and Woodchip Mulches for Erosion Control on Construction Sites,
W73-12463 4D

MULTIPLE PURPOSE PROJECTS
The Multipurpose Development of the River Rhone Valley,
W73-12467 4A

MUNICIPAL WASTES
Activated Sludge Treatment with Oxygen,
W73-12586 5D

MURDERKILL RIVER (DEL)
Trace Metal Baseline Studies on the Murderkill and St Jones Rivers, Delaware Coastal Plain,
W73-12959 5B

MUSSELS
Mussels in the Unique Nickajack Dam Construction Site, Tennessee River, 1965,
W73-12800 2I

NAMIB DESERT (SOUTH WEST AFRICA)
Welwitschia Mirabilis: Paradox of the Namib Desert,
W73-12796 2I

NARA RIVER (USSR)
Optimum Conditions for the Discharge of Paper Industry Effluents (Optimal'noe vodootvedenie stokov bumazhnogo proizvodstva),
W73-12547 5G

NATIONAL FORESTS
Valuation of Timber, Forage and Water from National Forest Lands,
W73-12701 6B

NATURAL OIL SEEPAGE
Investigation of the Nature, Extent and Fate of Natural Oil Seepage Off Southern California,
W73-12958 5B

NAVIGABLE WATERS
Proposed Oil Pollution Regulations, (Final Environmental Statement).
W73-12955 5G

NAVIGATION
Effects of Submerged Sills in the St. Clair River; Hydraulic Model Investigation,
W73-12572 8B

Estuarine Navigation Projects.
W73-12575 8B

Maintenance of the Hudson River Channel, New York, Navigation Project, (Final Environmental Statement).
W73-12588 8B

NAVIGATION CHANNELS
Delaware Estuary, Pennsylvania, New Jersey, and Delaware, Long-Range Dredged Spoil Disposal Problem.
W73-12560 5E

Effects of Proposed Dock Expansion at Newport News on Tides, Currents, and Shoaling; Hydraulic Model Investigation,
W73-12566 8B

Sea-Land Navigation Studies; Hydraulic Model Investigation,
W73-12567 8B

Navigation Channel Improvement, Gastineau Channel, Alaska; Hydraulic Model Investigation,
W73-12571 8A

NEARSHORE WATERS
Mercury Distribution in Estuarine-Nearshore Environment,
W73-12920 5B

NEBRASKA
Measuring and Developing Methods of Attitude and Motivational Change in Implementing the Big Blue River Basin Water Plan,
W73-12491 6B

Hydrologic Models for Poorly Defined Drainage Areas,
W73-12496 2A

Nutrients in Nebraska's Waters,
W73-12615 5B

NEKTON
Selectivity of Towed-Net Samplers,
W73-12669 7B

NELSON AND WALSH COUNTIES (N DAK)
Ground-Water Resources, Nelson and Walsh Counties, North Dakota,
W73-12578 2F

Geology of Nelson and Walsh Counties, North Dakota,
W73-12579 2F

NET ATTITUDE CHANGE
Measuring and Developing Methods of Attitude and Motivational Change in Implementing the Big Blue River Basin Water Plan,
W73-12491 6B

NET RETURN
Public Support of Private Water Resource Development in Agriculture--With Implications for Firm Growth,
W73-12698 4B

NEUTRALIZATION
Neutralization of Metal Containing Wastes,
W73-12462 5D

NEUTRON ACTIVATION ANALYSIS
Optimum Procedure for the Determination of Selenium in Biological Specimens Using Se-77m Neutron Activation,
W73-12876 5A

Thorium in Water and Algae from the Adriatic Sea,
W73-12927 5A

NEVADA
Evaluation of the Water Resources of Lemmon Valley, Washoe County, Nevada, With Emphasis on Effects of Ground-Water Development to 1971,
W73-12718 4B

Sources of Data for Evaluation of Selected Geothermal Areas in Northern and Central Nevada,
W73-12947 4B

NEW ENGLAND
Ecological Studies of Codium fragile in New England, USA,
W73-12918 5C

NEW GUINEA (MT. ALBERT EDWARD)
High-Altitude Forests and Grasslands of Mt. Albert Edward, New Guinea,
W73-12824 4A

NEW JERSEY
Standards for Soil Erosion and Sediment Control in New Jersey.
W73-12956 2J

NEW MEXICO
A Comparison of Rates of Water Loss Through Transpiration of Several Southern New Mexico Phreatophyte Species,
W73-12497 2D

NEW YORK
Annual Report of the New York State Urban Development Corporation, 1972.
W73-12356 3D

Comprehensive Public Water Supply Study for Schenectady County, New York.
W73-12358 3D

Summary Report: Comprehensive Sewerage Study for Schenectady County, New York.
W73-12359 5G

Town of Cairo Waste Water Report.
W73-12366 5D

Sea-Land Navigation Studies; Hydraulic Model Investigation,
W73-12567 8B

NEW ZEALAND
DDT in Some New Zealand Marine and Freshwater Fauna,
W73-12925 5A

NEW ZEALAND LAKES
Chemistry and Trophic Status of Seven New Zealand Lakes,
W73-12928 5C

NEWPORT NEWS
Effects of Proposed Dock Expansion at Newport News on Tides, Currents, and Shoaling; Hydraulic Model Investigation,
W73-12566 8B

NEXT-USE APPROACH
Identification and Achievement of Environmental Quality Levels in Managing the Use of Natural Resources,
W73-12696 5G

NIAGARA RIVER
The Niagara River Pollution Abatement Progress - 1971.
W73-12380 5G

NITRATES
An Investigation of the Nitrate Problem in Runnels County, Texas,
W73-12514 5B

Rapid Field Determination of Nitrate in Natural Waters,
W73-12810 2K

A Mathematical Model of the Nutrient Dynamics of Phytoplankton in a Nitrate-Limited Environment,
W73-12915 5C

NITRIFICATION
Nitrification in Sediments of Selected Wisconsin Lakes,
W73-12763 5C

Effect of Level of Soil Moisture on Nitrogen Mineralization and Nitrification During Incubation of East Pakistan Tea Soils,
W73-12799 3F

NITRILOTRIACETATE (TRISODIUM)
Trisodium Nitrilotriacetate in Drinking Water: Metabolic and Renal Effects in Rats,
W73-12982 5C

NITROGEN
Nutrient Enrichment and Eutrophication of Lake Michigan,
W73-12377 5C

A Nitrogen Correction for Caloric Values,
W73-12383 5A

Nitrogen: Recent Studies on the Role of Nitrogen in the Biostimulation and Eutrophication of Aquatic Ecosystems,
W73-12393 5C

Nutrients in Nebraska's Waters,
W73-12615 5B

Effects of Various Soil Moisture Regimes and Different Levels of Nitrogen and Different Spacings of the Quality of Potato Tubers (Solanum Tuberosum L.),
W73-12640 3F

Effect of Compaction on Yield and Uptake of N, P and K by Maize (Zea mays L.),
W73-12660 3F

Soil Nitrogen Balance in Selected Row-Crop Sites in Southern California,
W73-12670 3F

Nitrogen Release from Lake Sediments,
W73-12860 5B

The Mechanisms of Nitrogen Assimilation in Pseudomonads,
W73-12881 5C

Effects of Aeration, Water Supply, and Nitrogen Source on Growth and Development of Tupelo Gum and Bald Cypress,
W73-12923 2I

Nitrogen Loss from Flooded Soil,
W73-12967 2G

Effects of Water Stress on Nitrogen-Fixing Root Nodules: IV. Effects on Whole Plants of Vicia faba and Glycine max,
W73-12977 3F

NITROGEN COMPOUNDS
Nitrogen Release from Lake Sediments,
W73-12860 5B

NITROGEN CYCLE
The Nitrogen Cycle in Sediment-Water Systems,
W73-12843 5C

NITROGEN FERTILIZATION
Effect of Varying Water Management Practices on the Growth, Yield and Nitrogen Uptake by High-Yielding Rice Varieties,
W73-12583 3F

NITROGEN FIXATION
Flow of Microbially Fixed Nitrogen in a Model Ecosystem,
W73-12847 5B

NITROGEN FIXING BACTERIA
Flow of Microbially Fixed Nitrogen in a Model Ecosystem,
W73-12847 5B

NITROGEN ISOTOPE RATIO
An Investigation of the Nitrate Problem in Runnels County, Texas,
W73-12514 5B

NITROGEN RELEASE
Nitrogen Release from Lake Sediments,
W73-12860 5B

NONAQUEOUS SOLUTIONS
Voltammetric Study of the Hydrogen Ion/Hydrogen Couple in Acetonitrile/Water Mixtures,
W73-12872 2K

NORTH CAROLINA
Sediment Resulting From Construction of an Interstate Highway in the Piedmont Area of North Carolina,
W73-12713 4C

A Hydrographic Atlas of Larger North Carolina Sounds,
W73-12948 2L

NORTH DAKOTA
Ground-Water Resources, Nelson and Walsh Counties, North Dakota,
W73-12578 2F

Geology of Nelson and Walsh Counties, North Dakota,
W73-12579 2F

Studies on Helminths of North Dakota: IV. Parasites of the River Carpsucker, Carpiodes carpio, with Descriptions of Three New Species (Monogenea),
W73-12984 2I

NORTH DAKOTA (LAKE ASHTABULA)
Benthic Invertebrates in Lake Ashtabula Reservoir, North Dakota,
W73-12863 5C

NUCLEAR EXPLOSIONS
Radiochemical Monitoring of Water After the Cannikin Event, Amchitka Island, Alaska, October, 1972,
W73-12945 5B

NUISANCE BLOOMS
Sources of CO2 for Nuisance Blooms of Algae,
W73-13000 5C

NUTRIENT
Nutrient Uptake by Tupelo Gum and Bald Cypress from Saturated or Unsaturated Soil,
W73-12828 2I

NUTRIENT ABSORPTION (PLANTS)
Influence of Different Moisture Regimes and Methods of Phosphate Application on Growth and Nutrient Absorption by Wheat (Triticum Aestivum L.),
W73-12539 3F

NUTRIENT CYCLING (MINERALS)
Investigation of Mineral Nutrient Cycling in Upland Piedmont Forest,
W73-12700 4A

NUTRIENT INTERCHANGE
Phosphate Chemistry in Lake Sediments,
W73-12917 5C

NUTRIENT REMOVAL
Nutrient Control in North San Francisco Bay,
W73-12398 5C

Cross-Flow Filtration Process for Removal of Total Organic Carbon and Phosphates from Aqueous Sewage Effluents,
W73-12460 5D

Phosphorus Removal and Plant Operation Studies at Fort Wayne, Indiana,
W73-12500 5D

The Shagawa Lake Project: Lake Restoration by Nutrient Removal from Wastewater Effluent,
W73-12520 5D

NUTRIENT REQUIREMENTS
A Study of Inorganic Salts Requirements and Effect on the Morphology of Marine Bacteria,
W73-12628 5C

Phytoplankton Algae: Nutrient Concentrations and Growth,
W73-12924 5C

NUTRIENTS
Sediment-Water Nutrient Interchange in Eutrophic Lakes,
W73-12395 5C

Nutrients in Nebraska's Waters,
W73-12615 5B

Chemistry and Trophic Status of Seven New Zealand Lakes,
W73-12928 5C

NUTRITIVE STRESS
Physiological Changes in Mytilus Edulis L. Induced by Temperature and Nutritive Stress,
W73-12878 5C

OAHU (HAWAII)
Tritium Measurement of Natural Waters on Oahu, Hawaii: A Preliminary Interpretation (Sampling Period: July 1969 to June 1970),
W73-12499 5A

Climatology of Rainfall Probabilities for Oahu, Hawaii,
W73-12587 2B

OAKLEY DAM (ILL)
Spillway for Oakley Dam, Sangamon River, Illinois-Appendix A: Type 2 (Revised) Spillway,
W73-12582 8A

OCHROMONAS DANICA
Effect of Incubation Temperature on the Macromolecular and Lipid Content of the Phytoflagellate Ochromonas danica,
W73-12896 5C

OHIO
Interim Areawide Water and Sewer Plan: Bel-O-Mar area.
W73-12362 5G

Parasitism of Mosquitoes by Water Mites,
W73-12987 2I

OHIO RIVER
Interim Areawide Water and Sewer Plan: Bel-O-Mar area.
W73-12362 5G

OIL
Determination of Lead in Petroleum Additives Using Atomic Absorption Spectrophotometry,
W73-12864 5A

Investigation of the Nature, Extent and Fate of Natural Oil Seepage Off Southern California,
W73-12958 5B

OIL INDUSTRY
Impact of Costs Associated with New Environmental Standards Upon the Petroleum Refining Industry. Part I. The Impact of Environmental Control Costs.
W73-12708 5G

Petroleum...40 Years of Research,
W73-12768 3E

Proposed Oil Pollution Regulations, (Final Environmental Statement).
W73-12955 5G

Channel Erosion Surveys Along Proposed Taps Route, Alaska, July 1971,
W73-12957 2J

OIL POLLUTION
Vessel for the Removal of Oil on Water,
W73-12448 5G

Pollutant Recovery System,
W73-12456 5G

Biological Effects of Oil Pollution - Selected Bibliography II,
W73-12626 5C

OIL SPILLS
Control of Oil and Other Hazardous Materials.
W73-12427 5G

Vessel for the Removal of Oil on Water,
W73-12448 5G

Pollutant Recovery System,
W73-12456 5G

Proposed Oil Pollution Regulations, (Final Environmental Statement).
W73-12955 5G

OIL WELLS
Here's a New Sand Pack Method,
W73-12761 8G

Micellar Solutions Stimulate Wells,
W73-12762 8B

OILY WATER
Mariculture in Estuarine Oil-Pipeline Canals in Louisiana,
W73-12951 5C

Standing Crops of Natural Fish Populations in Brackish-Water Oil Field Pipeline Canals,
W73-12952 5C

OKANAGAN LAKE
Crustacean Plankton and the Eutrophication of Lakes in the Okanagan Valley, British Columbia,
W73-12624 5C

OKLAHOMA
Systems Approach to Metropolitan and Regional Area Water and Sewer Planning,
W73-12351 6A

Kay County, Oklahoma, Water and Sewerage Comprehensive Plan.
W73-12364 5G

Some Effects of Evaporation Suppression on Reservoir Ecology,
W73-12869 5C

ON-SITE DATA COLLECTIONS
The Use of Fish as Sensors in Industrial Waste Lines to Prevent Fish Kills,
W73-12889 5C

Estimation of Mortality Coefficients from Field Samples of Zooplankton,
W73-12906 5C

ON-SITE TEST
A Comparison of Liquid Scintillation and Geiger-Muller Estimates of Primary Productivity in an in Situ Experiment,
W73-12848 5A

ON-SITE TESTS
Uptake of Mercury by Caged Rainbow Trout (Salmo Gairdneri) in the South Saskatchewan River,
W73-12857 5C

ONION ROOTS
Characterization of Exudation from Excised Roots of Onion, Allium Cepa: I. Water Flux,
W73-12989 3F

ONON-ARGUN' STEPPE
Hydrochemical Description of the Onon-Argun' Steppe (Gidrokhimicheskaya kharakteristika Onon-Argunskoy stepi),
W73-12746 2K

ONTARIO
Ontario Unhappy with Efforts of Industry to Halt Pollution,
W73-12538 5G

OPEN CHANNEL FLOW
Computing Backwater at Open Channel Constrictions,
W73-12415 8B

Computer Determination of Critical Depth Control Points in Open Channel Flow,
W73-12483 8B

Effective Hydraulic Roughness for Channels Having Bed Roughness Different from Bank Roughness; A State-Of-The-Art Report,
W73-12565 8B

OPEN SPACES
Stream Quality Preservation Through Planned Urban Development,
W73-12518 5G

OPERCULAR BEATS
A Simple Method for Recording Fish Heart and Operculum Beats Without the Use of Implanted Electrodes,
W73-12858 7B

OPTICAL PROPERTIES
Optical Properties and Color of Lake Tahoe and Crater Lake,
W73-12926 5A

OPTIMAL DEVELOPMENT PLANS
Mathematical Modeling of Water Management Strategies in Urbanizing River Basins,
W73-12509 5G

Evaluation of Urban Water Management Policies in the Denver Metropolitan Area,
W73-12510 5G

OPTIMIZATION
Coordination of Agricultural and Urban Water Quality Management in the Utah Lake Drainage Area,
W73-12508 5G

Externalities, Welfare, And the Feasibility of Corrective Taxes,
W73-12694 6B

Mathematical Modeling for Environmental Pollution Control,
W73-12711 5G

Real-Time Interactive Instrumentation,
W73-12850 7A

OREGON
Tertiary Treatment of Combined Domestic and Industrial Wastes,
W73-12512 5D

Water Resource Decison Making--How Effective is the Public Input,
W73-12693 6B

Optical Properties and Color of Lake Tahoe and Crater Lake,
W73-12926 5A

ORGANIC ACIDS
A Relationship between Heterotrophic Utilization of Organic Acids and Bacterial Populations in West Blue Lake, Manitoba,
W73-12903 5C

ORGANIC COMPOUNDS
Studies on the Growth of Phaeodactylum Tricornutum. II. The Effect of Organic Substances on Growth,
W73-12389 5C

ORGANIC MATTER
Aspects of the Biogeochemistry of Carbohydrates and Proteins in Aquatic Environments,
W73-12371 5C

The Monitoring of Organic Matter with Polyurethane Foam,
W73-12868 5A

Bacterial Content of Particulate Matter in Offshore Surface Waters,
W73-12912 5B

ORGANOLEAD COMPOUNDS
Biological Aspects of Lead: An Annotated Bibliography - Literature From 1950 through 1964. Parts I and II,
W73-12627 5C

OSOYOOS LAKE MACROINVERTEBRATES
Crustacean Plankton and the Eutrophication of Lakes in the Okanagan Valley, British Columbia,
W73-12624 5C

OUTLET WORKS
Outlet Works Stilling Basin for Tallahala Dam, Tallahala Creek, Mississippi; Hydraulic Model Investigation,
W73-12568 8B

OUTLETS
Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-12506 5B

OXIDATION
Selective Substrate Utilization by Marine Hydrocarbonoclastic Bacteria,
W73-12621 5B

Comparison of Waterflood Corrosion Detection and Monitoring Devices,
W73-12757 8G

OXIDATION LAGOON
Stabilization of Sewage Solids by the Channel Aeration Process,
W73-12502 5D

OXIDATION-REDUCTION POTENTIAL
The Influence of Vegetation on the Redox Profile in the Sediment of Grane Langso, A Danish Lobelia Lake,
W73-12379 5C

OXYGEN DEMAND
Wastewater Treatment Design Related to Biological Growth Supported by Activated Carbon,
W73-12494 5D

OXYGEN DIFFUSION CONTROL
Corrosion of Metals in Tropical Waters---Structural Ferrous Metals,
W73-12772 8G

OXYGEN SAG
The Effect of Longitudinal Dispersion on the Deoxygenation Rate in Polluted Streams,
W73-12714 5B

Swimming Performance of Young Atlantic Salmon (Salmo salar) as Affected by Reduced Ambient Oxygen Concentration,
W73-12897 5C

OXYGEN UPTAKE
Wastewater Treatment Design Related to Biological Growth Supported by Activated Carbon,
W73-12494 5D

OXYGENATION
Wastewater Treatment System,
W73-12455 5D

OYSTERS
The Effect of Floodwater on Oysters in Mobile Bay,
W73-12658 5C

PACIFIC HERRING
A Record of Pacific Herring (Clupea harengus Pallasi) Feeding on Juvenile Chinook Salmon (Oncorhynchus tshawytscha) in a British Columbia Estuary,
W73-12375 2L

PACIFIC OCEAN
Process-Form Variability of Multiclass Coasts: Baja California,
W73-12422 2L

PADDY FIELDS
Ecological Information on the Differences in the Number of Culex tritaeniorhynchus Larvae Among Paddy Fields (In Japanese),
W73-12829 3F

PALEOCLIMATOLOGY
Trials on Trends Through Clusters of Cirques,
W73-12732 2J

PAPER MILL WASTES
Influence of Land Reclamation and Waste Water from Paper Mill on Environment of 'Nori' (Porphyra Tenera) Culture Farm, (In Japanese),
W73-12639 5C

PARTICLE SIZE
Dynamics of a Falling Particle Zone,
W73-12603 2B

PARTICULATE MATTER
Bacterial Content of Particulate Matter in Offshore Surface Waters,
W73-12912 5B

PASTURES
Cenchrus Ciliaris--A Perennial Pasture Grass of Arid and Semi-Arid Areas,
W73-12790 4A

PATENTS
System for Removing Color From Paper Mill Liquid Waste,
W73-12445 5D

Water Decolorization,
W73-12446 5D

Method of Reducing Phenolic Waste,
W73-12447 5D

PATENTS

Vessel for the Removal of Oil on Water,
W73-12448 5G

Process and Apparatus for Removing Mercury from Waste Water,
W73-12449 5D

High-Purity Distilled Water Producing Apparatus,
W73-12450 3A

Activated Sludge Plant,
W73-12451 5D

Flotation Machine with Vertically Reciprocating Aerators,
W73-12452 5D

Heat-Exchanger for Desalting Sea Water,
W73-12453 3A

Waste Disposal Assembly,
W73-12454 5D

Wastewater Treatment System,
W73-12455 5D

Pollutant Recovery System,
W73-12456 5G

Circular Flotation System,
W73-12457 5D

Process of Treating and Purifying Sewage, Particularly of Sewage Contaminated with Detergents,
W73-12458 5D

Waste Water Purification by Breakpoint Chlorination and Carbon Adsorption,
W73-12459 5D

Cross-Flow Filtration Process for Removal of Total Organic Carbon and Phosphates from Aqueous Sewage Effluents,
W73-12460 5D

Waste Treatment System,
W73-12461 5D

Neutralization of Metal Containing Wastes,
W73-12462 5D

PATH OF POLLUTANTS

Lead Pollution: Records in Southern California Coastal Sediments,
W73-12589 5B

Long-Lived Pollutants in Sediments From the Laguna Atascosa National Wildlife Refuge, Texas,
W73-12595 5B

Heavy Metals in Estuaries and the Coastal Zone,
W73-12606 5B

The Effect of Longitudinal Dispersion on the Deoxygenation Rate in Polluted Streams,
W73-12714 5B

Flow of Microbially Fixed Nitrogen in a Model Ecosystem,
W73-12847 5B

Lithium Silicate Sedimentation Tracer for Shoal Deposit Studies,
W73-12862 5B

Mercury Distribution in Estuarine-Nearshore Environment,
W73-12920 5B

Salt Pollution of a Shallow Aquifer--Indianapolis, Indiana,
W73-12940 5B

PATUXENT ESTUARY (MD)

Observations of Intermediate and Small Scale Turbulent Water Motion in a Stratified Estuary (Parts I and II),
W73-12424 2L

PEACHES

Viruses Infecting Peaches in the Murrumbidgee Irrigation Areas of New South Wales,
W73-12981 3F

PEAT BOGS

Water Relations of Plants in Raised Sphagnum Peat Bogs,
W73-12838 2I

PEE DEE REGION (SOUTH CAROLINA)

Functional Water and Sewerage Plan and Program, Pee Dee Region, South Carolina.
W73-12365 5G

PENNSYLVANIA

Delaware Estuary, Pennsylvania, New Jersey, and Delaware, Long-Range Dredged Spoil Disposal Problem.
W73-12560 5E

Effect of School Water Fluoridation on Dental Caries: Final Results in Elk Lake, Pa., After 12 years,
W73-12647 5C

New Applications of Geophysical Methods to Ground-Water Problems in Pennsylvania,
W73-12783 2F

Simplification of the Blue Mountain Lichen Communities Near a Zinc Factory,
W73-12973 5C

PENSACOLA (FLORIDA)

The Design and Operation of Deep-Well Disposal System,
W73-12780 5E

PERCHLORIC ACID

Voltammetric Study of the Hydrogen Ion/Hydrogen Couple in Acetonitrile/Water Mixtures,
W73-12872 2K

PERCOLATION

Laboratory Investigations of the Transmission Capacity of Frozen and Thawed Soils Based on Data of the Valday Field Laboratory (Vnigl) (Laboratornyye issledovaniya vodopropusknoy sposobnosti merzlykh i talykh pochvo-gruntov (po materialam merzlothoy laboratorii VNIGL)),
W73-12437 2G

Factors Affecting the Percolation Test,
W73-12716 5B

PERCOLATION TESTS

Factors Affecting the Percolation Test,
W73-12716 5B

PERFORMANCE TESTS

Turbine Design and Performance for the Mersey-Forth Hydro Power Development,
W73-12486 8C

PERMEABILITY

Leaching Salty Soils,
W73-12789 2G

Nomograph for Hydraulic Conductivity and Intrinsic Permeability of Water-Soil System,
W73-12808 2G

PERSISTENCE

Dispersion, Dispersal, and Persistence of the Annual Intertidal Alga, Postelsia Palmeformis Ruprecht,
W73-12883 5C

PERSONNEL

WPCF Project Report: A State Certification Program Guide,
W73-12842 5G

PERU

Catastrophic Rock Slide, Mount Huascaran, North-Central Peru, May 31, 1970,
W73-12409 2J

Peruvian Fisheries: Conservation and Development.
W73-12689 6B

PEST CONTROL

Report to the Federal Working Group on Pest Management from the Task Group on Categorization of Pesticides Used by the Federal Government.
W73-12598 5G

PESTICIDE RESIDUES

Insecticide Residues in Water and Sediment from Cisterns on the U.S. and British Virgin Islands - 1970,
W73-12894 5B

PESTICIDES

Electrostatic Crop Spraying,
W73-12482 3F

Long-Lived Pollutants in Sediments From the Laguna Atascosa National Wildlife Refuge, Texas,
W73-12595 5B

Report to the Federal Working Group on Pest Management from the Task Group on Categorization of Pesticides Used by the Federal Government.
W73-12598 5G

pH-Sensitive Fluorogenic Spray Reagents: II. Quantitative Studies with Pesticides,
W73-12727 5A

Effects of Pesticides in Water--A Report to the States.
W73-12752 5G

PESTICIDES CATEGORIZATION

Report to the Federal Working Group on Pest Management from the Task Group on Categorization of Pesticides Used by the Federal Government.
W73-12598 5G

PETROLEUM HYDROCARBONS

Steam Distillation: A Simple Technique for Recovery of Petroleum Hydrocarbons from Tainted Fish,
W73-12849 5A

PHAEODACTYLUM TRICORNUTUM

Studies on the Growth of Phaeodactylum Tricornutum. II. The Effect of Organic Substances on Growth,
W73-12389 5C

PHAEOPHYTA
Correlated Light and Electron Microscope Studies on Brown Algae. II. Physode Production in Dictyota,
W73-12388 5C

Dispersion, Dispersal, and Persistence of the Annual Intertidal Alga, Postelsia Palmeformis Ruprecht,
W73-12883 5C

PHEASANTS
Effects of Stress on Pheasants Previously Given Polychlorinated Biphenyls,
W73-12995 5C

PHENOLIC PESTICIDES
Preparation and Properties of 3-Trifluoromethyl-4-Aminophenol,
W73-12622 5B

PHENOLS
Method of Reducing Phenolic Waste,
W73-12447 5D

Recondition and Reuse of Organically Contaminated Waste Sodium Chloride Brines,
W73-12521 5D

PHOSPHATES
Study of Utilization and Disposal of Lime Sludges Containing Phosphates,
W73-12501 5D

Influence of Different Moisture Regimes and Methods of Phosphate Application on Growth and Nutrient Absorption by Wheat (Triticum Aestivum L.),
W73-12539 3F

Phosphate Chemistry in Lake Sediments,
W73-12917 5C

PHOSPHOROUS
Effect of Compaction on Yield and Uptake of N, P and K by Maize (Zea mays L.),
W73-12660 3F

PHOSPHORUS
Nutrient Enrichment and Eutrophication of Lake Michigan,
W73-12377 5C

Phosphorus and Eutrophication,
W73-12394 5C

The Shagawa Lake Project: Lake Restoration by Nutrient Removal from Wastewater Effluent,
W73-12520 5D

Nutrients in Nebraska's Waters,
W73-12615 5B

The Characterization of Soluble Phosphorus Released by Limnetic Zooplankton,
W73-12904 5B

PHOSPHORUS REMOVAL
Phosphorus Removal and Plant Operation Studies at Fort Wayne, Indiana,
W73-12500 5D

PHOTO SULFOXIDATION
Photosulfoxidation of Hydrocarbons in the Liquid Phase,
W73-12833 2K

PHOTOSYNTHESIS
Extreme Water Stress and Photosynthetic Activity of the Desert Plant Artemisia Herba-Alba Asso,
W73-12785 2I

Physiology and Cytological Chemistry of Blue-Green Algae,
W73-12845 5C

Simulation Study of Phytoplankton Photosynthesis and Growth in the Fraser River Estuary,
W73-12919 5C

PHREATOPHYTES
A Comparison of Rates of Water Loss Through Transpiration of Several Southern New Mexico Phreatophyte Species,
W73-12497 2D

PHYSICAL CONTROL
Water Pollution in the Pulp and Paper Industry. IV. Treatment Methods. A. Physical Operations,
W73-12556 5D

PHYSICAL PROPERTIES
Annotated Bibliography of Lake Ontario Limnological and Related Studies - Vol III - Physical,
W73-12755 2H

PHYSIOCHEMICAL PROPERTIES
Preparation and Properties of 3-Trifluoromethyl-4-Aminophenol,
W73-12622 5B

PHYSIOGNOMY
The Physiognomy and Structure of the Benthic Macrophyte Communities on Rocky Shores in the Southwestern Archipelago of Finland (Seili Islands),
W73-12929 5A

PHYSIOLOGICAL ECOLOGY
Physiological Changes in Mytilus Edulis L. Induced by Temperature and Nutritive Stress,
W73-12878 5C

PHYSODES
Correlated Light and Electron Microscope Studies on Brown Algae. II. Physode Production in Dictyota,
W73-12388 5C

PHYTOKARST
Black Phytokarst From Hell, Cayman Islands, British West Indies,
W73-12593 2J

PHYTOPLANKTON
Mathematical modeling of Phytoplankton Populations,
W73-12399 5C

An Interdisciplinary Study of the Estuarine and Coastal Oceanography of Block Island Sound and Adjacent New York Coastal Waters,
W73-12629 5A

Artificial Reservoir Destratification Effects on Phytoplankton,
W73-12895 5C

A Mathematical Model of the Nutrient Dynamics of Phytoplankton in a Nitrate-Limited Environment,
W73-12915 5C

Simulation Study of Phytoplankton Photosynthesis and Growth in the Fraser River Estuary,
W73-12919 5C

Phytoplankton Algae: Nutrient Concentrations and Growth,
W73-12924 5C

PICLORAM ADSORPTION
Herbicide Contamination of Surface Runoff Waters,
W73-12511 5B

PIEDMONT FORESTS
Investigation of Mineral Nutrient Cycling in Upland Piedmont Forest,
W73-12700 4A

PIGMENTS
Laser Induced Fluorescence in Algae: A New Technique for Remote Detection,
W73-12841 5A

PIGOUVIAN TAX POLICY
Externalities, Welfare, And the Feasibility of Corrective Taxes,
W73-12694 6B

PINES (RED)
Water Potential in Red Pine: Soil Moisture, Evapotranspiration, Crown Position,
W73-12837 2I

PIPELINES
Cathodic Protection for Coated Steel Pipelines,
W73-12765 8G

Channel Erosion Surveys Along Proposed Taps Route, Alaska, July 1971,
W73-12957 2J

PITLESS ADAPTERS
Pitless Units and Adapters,
W73-12776 8G

PITTING
Comparison of Waterflood Corrosion Detection and Monitoring Devices,
W73-12757 8G

PIUTE SCULPIN
Contributions to the Life History of the Piute Sculpin in Sagehen Creek, California,
W73-12986 2I

PLANKTON
Some Effects of Artificial Fertilization on Enclosed Plankton Populations in Marion Lake, British Columbia,
W73-12384 5C

Selectivity of Towed-Net Samplers,
W73-12669 7B

Trace Element Trapping in Pteropod Tests,
W73-12937 5B

PLANNING
Systems Approach to Metropolitan and Regional Area Water and Sewer Planning,
W73-12351 6A

Identification of Water Resources Planning Problems in the Metropolitan Area of Greater San Antonio and Its Associated Counties,
W73-12354 6B

Comprehensive Public Water Supply Study for Schenectady County, New York.
W73-12358 3D

Summary Report: Comprehensive Sewerage Study for Schenectady County, New York.
W73-12359 5G

Interim Areawide Water and Sewer Plan: Bel-O-Mar area.
W73-12362 5G

Functional Water and Sewerage Plan and Program, Pee Dee Region, South Carolina.
W73-12365 5G

PLANNING

Town of Cairo Waste Water Report.
W73-12366 5D

The Lakefront Plan of Chicago.
W73-12367 4C

New Techniques for Participative Planning in Water Resources,
W73-12472 6B

Determination of Public Environmental Preferences in Water Resources Planning and Development,
W73-12706 6B

The Development of a Regional Systems Oriented Water Management Model: A Tool for Policy Analysis,
W73-12839 6A

Annual Literature Review: Administration, Systems Analysis,
W73-12840 5G

PLANT GROWTH

Studies on the Growth of Phaeodactylum Tricornutum. II. The Effect of Organic Substances on Growth,
W73-12389 5C

Effects of Light and Temperature on Algal Growth,
W73-12396 5C

The Effect of Soil Temperature on Plants Grown in Saline Soil,
W73-12797 2G

PLANT MORPHOLOGY

Physiology and Cytological Chemistry of Blue-Green Algae,
W73-12845 5C

PLANT PHYSIOLOGY

Sodium Relations in Desert Plants: 1. Cation Contents of Some Plant Species from the Mojave and Great Basin Deserts,
W73-12792 2I

Sodium Relations in Desert Plants: 2. Distribution of Cations in Plant Parts of Three Different Species of Atriplex,
W73-12793 2I

Physiology and Cytological Chemistry of Blue-Green Algae,
W73-12845 5C

Ecological Studies of Codium fragile in New England, USA,
W73-12918 5C

PLANT POPULATIONS

Some Effects of Artificial Fertilization on Enclosed Plankton Populations in Marion Lake, British Columbia,
W73-12384 5C

PLANT TISSUES

Welwitschia Mirabilis: Paradox of the Namib Desert,
W73-12796 2I

PLATINUM ELECTRODES

Voltammetric Study of the Hydrogen Ion/Hydrogen Couple in Acetonitrile/Water Mixtures,
W73-12872 2K

PLEISTOCENE EPOCH

Trials on Trends Through Clusters of Cirques,
W73-12732 2J

POLAND

Construction Costs of Water Supply and Sewage Networks in Poland--1961-1970,
W73-12703 6C

POLAROGRAPHIC DETERMINATION

Simultaneous Polarographic Determination of Iron (II) and Iron (III) in Coal Mine Waste Water,
W73-12976 5A

POLICIES

Anti-Pollution Policy and Cost Allocation: The Issues in Practice,
W73-12677 6B

POLIOVIRUS

Poliovirus in a Water Supply,
W73-12922 5B

POLITICAL ASPECTS

The Development of a Regional Systems Oriented Water Management Model: A Tool for Policy Analysis,
W73-12839 6A

POLLUTANT EFFECTS

Biological Aspects of Lead: An Annotated Bibliography - Literature From 1950 through 1964. Parts I and II,
W73-12627 5C

Some Short-Term Indicators of Sublethal Effects of Copper on Brook Trout, Salvelinus Fontinalis,
W73-12859 5C

POLLUTANT IDENTIFICATION

PCBs and DDT,
W73-12402 5C

Use of Coliphages as Indicators of Water pollution,
W73-12525 5A

Determination of Organic Substances in Industrial Effluents (Nektere moznosti stanoveni organickeho znecisteni odpadnich vod),
W73-12532 5A

Environmental Impact Study.
W73-12580 5G

Problems in the Analysis of Trace Metals,
W73-12608 5A

Factors Influencing Detection of Salmonellae in Rendered Animal By-Products,
W73-12619 5A

Biological Aspects of Lead: An Annotated Bibliography - Literature From 1950 through 1964. Parts I and II,
W73-12627 5C

Identification and Measurement of Environmental Pollutants. Symposium.
W73-12655 5A

Laser Induced Fluorescence in Algae: A New Technique for Remote Detection,
W73-12841 5A

Additional Studies for the Spectrophotometric Measurement of Iodine in Water.
W73-12851 5A

Characterization of Sweet Potato Processing Wastes,
W73-12852 5A

An Improved Method For Determining Organics by Activated Carbon Adsorption and Solvent Extraction - Pt. II (Test Method),
W73-12866 5A

The Monitoring of Organic Matter with Polyurethane Foam,
W73-12868 5A

Sodium Tungsten Bronze as a Potentiometric Indicating Electrode for Dissolved Oxygen in Aqueous solution,
W73-12873 5A

Instrumental and Numerical Considerations for On-Line Interpretation of High Resolution Mass Spectral Data,
W73-12874 2K

The Characterization of Soluble Phosphorus Released by Limnetic Zooplankton,
W73-12904 5B

Behavior of the Goldfish as an Early Warning System for the Presence of Pollutants in Water,
W73-12916 5A

Analytical Reviews 1973/Applications.
W73-12930 5A

Determination of Alkylbenzenesulfonate (ABS) in Bottom Sediment,
W73-12932 5A

POLLUTANTS

Analytical Reviews 1973/Applications.
W73-12930 5A

POLLUTION

Petroleum...40 Years of Research,
W73-12768 3E

POLLUTION ABATEMENT

The Niagara River Pollution Abatement Progress - 1971.
W73-12380 5G

Control of Oil and Other Hazardous Materials.
W73-12427 5G

Vessel for the Removal of Oil on Water,
W73-12448 5G

Waste Disposal Assembly,
W73-12454 5D

Pollutant Recovery System,
W73-12456 5G

Ontario Unhappy with Efforts of Industry to Halt Pollution,
W73-12538 5G

Environmental Care at Pulp Mills, Results and Expectations,
W73-12545 5D

Advanced Pollution Abatement Technology in the Pulp and Paper Industry.
W73-12552 5D

Environmental Impact Study.
W73-12580 5G

Problems of Environmental Economics.
W73-12675 6B

Environmental Policy Issues: Real and Fictitious,
W73-12676 6B

Anti-Pollution Policy and Cost Allocation: The Issues in Practice,
W73-12677 6B

Notes on Information and Administrative Costs in the Theory of Externalities,
W73-12678 6B

Environmental Quality Indicators and Social Indicators,
W73-12679 6B

Peter Bohm.
W73-12680 6B

The Set up of the Statistical System Within Which the Deterioration of the Human Environment will be Estimated,
W73-12681 6B

Some Limitations of Benefit-Cost Analysis in Respect of Programmes with Environmental Consequences,
W73-12682 6B

Evaluation of the Economic Effects of Anti-Pollution Public Policy,
W73-12684 6B

Economic Effects of Technology Changes in Relation to the Environment,
W73-12685 6B

The Role of Uniform Standards in International Environmental Management.
W73-12686 6B

Environmental Cost of Mining,
W73-12687 5G

Note on Charges and Bribes in the Long Run within Watersheds,
W73-12702 5G

A Study of the Economic Impact on the Steel Industry of the Costs of Meeting Federal Air and Water Pollution Abatement Requirements. Part I - Executive Summary.
W73-12707 5G

Impact of Costs Associated with New Environmental Standards Upon the Petroleum Refining Industry. Part I. The Impact of Environmental Control Costs.
W73-12708 5G

A Descriptive Analysis of the Bakery Products Industry Detailing Industry Trends and Characteristics Relevant to Economic Impact Analysis of Environmental Standards. Part II.
W73-12709 5G

A Study of the Impact of Pollution Standards and Charges on the Bakery Industry. Part III.
W73-12710 5G

POLLUTION CONTROL

Anti-Pollution Policy and Cost Allocation: The Issues in Practice,
W73-12677 6B

Environmental Quality Indicators and Social Indicators,
W73-12679 6B

Peter Bohm.
W73-12680 6B

The Set up of the Statistical System Within Which the Deterioration of the Human Environment will be Estimated,
W73-12681 6B

Some Limitations of Benefit-Cost Analysis in Respect of Programmes with Environmental Consequences,
W73-12682 6B

Evaluation of the Economic Effects of Anti-Pollution Public Policy,
W73-12684 6B

The Role of Uniform Standards in International Environmental Management.
W73-12686 6B

POLLUTION CONTROL TREATMENT

River Thames Antipollution: Boardmakers Install World's Largest Tidal River Surface Aerator.
W73-12548 5G

Aeration of the Thames.
W73-12549 5G

Large Surface Aerator Designed to Condition Board Mill Effluent.
W73-12550 5G

POLLUTION EFFECTS

Environmental Contamination by Toxic Metals,
W73-12605 5B

Arsenic and Cadmium in the Environment,
W73-12607 5C

POLLUTION TAXES (CHARGES)

Antipollution Policies, Their Nature and Their Impact on Corporate Profits,
W73-12695 5G

Note on Charges and Bribes in the Long Run within Watersheds,
W73-12702 5G

A Descriptive Analysis of the Bakery Products Industry Detailing Industry Trends and Characteristics Relevant to Economic Impact Analysis of Environmental Standards. Part II.
W73-12709 5G

A Study of the Impact of Pollution Standards and Charges on the Bakery Industry. Part III.
W73-12710 5G

POLLUTION TOLERANCE (FISH)

Effect of Heavy Metals on Fish,
W73-12611 5C

Effects of Metals on Fertilization and Development in Fish,
W73-12612 5C

POLYAROMATIC HYDROCARBONS

Polyaromatic Hydrocarbons in High-Boiling Petroleum Distillates. Isolation by Gel Permeation Chromatography and Identification by Fluorescence Spectrometry,
W73-12875 5A

POLYCHLORINATED BIPHENYLS

PCBs and DDT,
W73-12402 5C

Metabolic Effects of PCB (Polychlorinated Biphenyls) on the Brown Trout (Salmo trutta),
W73-12819 5C

DDT in Some New Zealand Marine and Freshwater Fauna,
W73-12925 5A

POLYELECTROLYTES

Viruses in Metropolitan Waters: Concentration by Polyelectrolytes, Freeze Concentration, and Ultrafiltration,
W73-12867 5F

POLYWATER

Soviet Study Shows Polywater Doesn't Exist.
W73-12540 1B

PORE SPACE

Leaching of Cement from a Concrete Pile Section by Groundwater Flow,
W73-12766 8F

PORES

Theory of Water Movement in Soils: 10. Cavities with Constant Flux,
W73-12600 2G

POSTELSIA PALMAEFORMIS

Dispersion, Dispersal, and Persistence of the Annual Intertidal Alga, Postelsia Palmeformis Ruprecht,
W73-12883 5C

POSTGLACIAL

Stratigraphy of Fossil Pigments as a Guide to the Postglacial History of Kirchner Marsh, Minnesota,
W73-12386 5C

POTABLE WATER

Health Standards for Metals in Drinking Water,
W73-12610 5G

Concentration of Fluorine in Potable Water in Bihar Plateau: A Preliminary Survey,
W73-12645 5A

Poliovirus in a Water Supply,
W73-12922 5B

Trisodium Nitrilotriacetate in Drinking Water: Metabolic and Renal Effects in Rats,
W73-12982 5C

Fluoridation or Fluoride Supplements: A Statement by the Nutrition Committee, Canadian Paediatric Society.
W73-12990 5G

POTASSIUM

Effect of Compaction on Yield and Uptake of N, P and K by Maize (Zea mays L.),
W73-12660 3F

POTATO TUBERS

Effects of Various Soil Moisture Regimes and Different Levels of Nitrogen and Different Spacings of the Quality of Potato Tubers (Solanum Tuberosum L.),
W73-12640 3F

POTENTIOMETRY

Sodium Tungsten Bronze as a Potentiometric Indicating Electrode for Dissolved Oxygen in Aqueous solution,
W73-12873 5A

POWERPLANTS

California Power Plant Siting Study: Volumes, I, II, and III.
W73-12574 5G

PRE-IMPOUNDMENT

Preimpoundment Study of West Point Lake, Georgia,
W73-12376 5C

PRECIPITATION (ATMOSPHERIC)

Climatology of Rainfall Probabilities for Oahu, Hawaii,
W73-12587 2B

Dynamics of a Falling Particle Zone,
W73-12603 2B

PRECIPITATION PARTICLES

Dynamics of a Falling Particle Zone,
W73-12603 2B

PRECIPITATION THEORY
Theory of Precipitation Effects on Dead Cylindrical Fuels,
W73-12381 2B

PREDATION
Predation by Rainbow Trout (Salmo Gairdneri): The Influence of Hungar, Prey Density and Prey Size,
W73-12836 8I

PRESIDIO (TEX)
Presidio Bolson, Trans-Pecos Texas and Adjacent Mexico: Geology of a Desert Basin Aquifer System,
W73-12585 2F

PRESTRESSING
Stresses in the Body and Foundations of Prestressed Dams,
W73-12475 8A

PRICING
The Effect of Price and Other Selected Variables on Water Consumption,
W73-12495 6B

PRIMARY PRODUCTIVITY
A Comparison of Liquid Scintillation and Geiger-Muller Estimates of Primary Productivity in an in Situ Experiment,
W73-12848 5A

An Evaluation of Liquid Scintillation Counting Techniques for Use in Aquatic Primary Production Studies,
W73-12907 5A

Membrane Filter Retention--A Source of Error in the C-14 Method of Measuring Primary Production,
W73-12908 5A

Simulation Study of Phytoplankton Photosynthesis and Growth in the Fraser River Estuary,
W73-12919 5C

Phytoplankton Algae: Nutrient Concentrations and Growth,
W73-12924 5C

Primary Productivity in a New and an Older California Reservoir,
W73-12998 8I

PRIORITIES
Heuristic Ranking and Prioritizing Under Subjective Conductions,
W73-12470 6B

PRODUCTIVITY
A Nitrogen Correction for Caloric Values,
W73-12383 5A

Nutrient Control in North San Francisco Bay,
W73-12398 5C

AGP Studies in the San Francisco Bay-Delta,
W73-12401 5C

PROFUNDAL FAUNA
The Profundal Fauna of Llyn Tegid, North Wales,
W73-12823 2I

PROJECT PLANNING
Heuristic Ranking and Prioritizing Under Subjective Conductions,
W73-12470 6B

A Proposed Streamflow Data Program for Connecticut,
W73-12748 4A

PROJECTS
Estuarine Navigation Projects.
W73-12575 8B

Maintenance of the Hudson River Channel, New York, Navigation Project, (Final Environmental Statement).
W73-12588 8B

Publications of Water Resources Investigations in Colorado and Selected Publications Pertaining to Colorado.
W73-12954 2A

PROTEIN
Protein Content of Brown Rice by Upland Polyethylene Film Mulching Culture, (In Japanese),
W73-12806 3F

PROTEINS
Aspects of the Biogeochemistry of Carbohydrates and Proteins in Aquatic Environments,
W73-12371 5C

PSEUDOMONADS
The Mechanisms of Nitrogen Assimilation in Pseudomonads,
W73-12881 5C

PSEUDOMONAS AERUGINOSA
ATP Pools in Pure and Mixed Cultures,
W73-12887 5A

PSYCHOLOGICAL ASPECTS
Measuring Public Responses to Vegetative Management,
W73-12408 4D

PTEROPODS
Trace Element Trapping in Pteropod Tests,
W73-12937 5B

PUBLIC FINANCING
Public Support of Private Water Resource Development in Agriculture--With Implications for Firm Growth,
W73-12698 4B

PUBLIC HEALTH
Heavy Metals in the Environment.

RAINDROP SIZES

Extremes of Hydrometeors at Altitude for Mil-Std-210B: Supplement--Drop-Size Distributions,
W73-12599 2B

RAINDROPS

Extremes of Hydrometeors at Altitude for Mil-Std-210B: Supplement--Drop-Size Distributions,
W73-12599 2B

RAINFALL

Resistance in Digitaria to Yellow Sugarcane Aphid, Siphaflava (Forbes) as Related to Temperature and Rainfall,
W73-12643 2I

Variability of Rainfall and Agricultural Efficiency of Sholapur District,
W73-12659 3F

Delayed Seed Dispersal and Rapid Germination as Survival Mechanisms of the Desert Plant Blepharis Persica (Burm.) Kuntze,
W73-12787 2I

RAINFALL INTENSITY

Extremes of Hydrometeors at Altitude for Mil-Std-210B: Supplement--Drop-Size Distributions,
W73-12599 2B

RAINFALL-RUNOFF RELATIONSHIPS

Hydrological Reservoir Design Using Basic Systems Theory Techniques,
W73-12471 8A

RATES

Boost A/D Rates with Staggered Operation,
W73-12893 7C

RAYCYCLE PROCESS

Waste Treatment Plant at ITT Rayonier Inc. Mill, Fernandina Beach, Florida.
W73-12541 5D

REAL-TIME COMPUTERS

Real-Time Interactive Instrumentation,
W73-12850 7A

REARING (FISH)

Rearing Channel Catfish Fingerlings Under Intensive Culture Conditions,
W73-12488 8I

RECHARGE

Analysis of Seepage Into Ground-Water System,
W73-12412 4B

Environmental Isotopes and Circulation in Aquifers Under Venice (Isotopes du Milieu et Circulations dans les Aquiferes du Sous-Sol Venitien),
W73-12419 2F

The Disposal of Wastewater Underground,
W73-12781 5E

RECREATION

Outdoor Recreation in the Baltimore Area.
W73-12360 6D

The Lakefront Plan of Chicago.
W73-12367 4C

Evaluation of Environmental Intangibles,
W73-12688 6B

RECREATION DEMAND

Outdoor Recreation in the Baltimore Area.
W73-12360 6D

RECYCLING

New Trends in Waste Water Treatment and Recycle,
W73-12533 5D

REFINERIES

Impact of Costs Associated with New Environmental Standards Upon the Petroleum Refining Industry. Part I. The Impact of Environmental Control Costs.
W73-12708 5G

REFUSE PILES

Control of Mine Drainage from Coal Mine Mineral Wastes - Phase II - Pollution Abatement and Monitoring,
W73-12516 5G

REGENERATION

The Selection of Eucalpts for Regeneration,
W73-12980 2I

REGIONAL ANALYSIS
Systems Approach to Metropolitan and Regional Area Water and Sewer Planning,
W73-12351 6A

Interim Areawide Water and Sewer Plan: Bel-O-Mar area.
W73-12362 5G

Functional Water and Sewerage Plan and Program, Pee Dee Region, South Carolina.

REGRESSION ANALYSIS
The Effect of Price and Other Selected Variables on Water Consumption,
W73-12495 6B

Diamond-Bit Research Provides Basic Drilling Parameters,
W73-12764 8B

REMOTE SENSING
Evaluation of ERTS Data for Certain Oceanographic Uses,
W73-12429 7B

An Investigation of the Nitrate Problem in Runnels County, Texas,
W73-12514 5B

An Interdisciplinary Study of the Estuarine and Coastal Oceanography of Block Island Sound and Adjacent New York Coastal Waters,
W73-12629 5A

Water Quality Determinations in the Virgin Islands from ERTS-A Data,
W73-12630 5A

Laser Induced Fluorescence in Algae: A New Technique for Remote Detection,
W73-12841 5A

REPRODUCIBILITY
An Improved AA Microsampling System,
W73-12865 5A

REPTILES MORTALITY
Aeromonas-Induced Deaths Among Fish and Reptiles in an Eutrophic Inland Lake,
W73-12633 5C

RESERVOIR CAPACITY
Hydrological Reservoir Design Using Basic Systems Theory Techniques,
W73-12471 8A

Reservoir-Yield Estimation Procedures,
W73-12478 4A

RESERVOIR DESIGN
Hydrological Reservoir Design Using Basic Systems Theory Techniques,
W73-12471 8A

Reservoir-Yield Estimation Procedures,
W73-12478 4A

RESERVOIR STORAGE
Hydrological Reservoir Design Using Basic Systems Theory Techniques,
W73-12471 8A

Reservoir-Yield Estimation Procedures,
W73-12478 4A

RESERVOIR YIELD
Reservoir-Yield Estimation Procedures,
W73-12478 4A

RESERVOIRS
Preimpoundment Study of West Point Lake, Georgia,
W73-12376 5C

Selective Withdrawal from Man-Made Lakes, Hydraulic Laboratory Ivestigation,
W73-12569 4A

Biological Effects of Artificial Destratification and Aeration in Lakes and Reservoirs-Analysis and Bibliography,
W73-12625 5C

Some Effects of Evaporation Suppression on Reservoir Ecology,
W73-12869 5C

Artificial Reservoir Destratification Effects on Phytoplankton,
W73-12895 5C

RESIN COMPOUNDS
Sand Control - 3. Chemical Consolidation,
W73-12760 8G

RESINS
Determination of Melamine-Formaldehyde Resin in White Waters (Opredelenie soderzhaniya melamino-formaldegidnoi smoly v podsetochnykh vodakh),
W73-12672 5A

Application of Liquid Chromatography to Pollution Abatement Studies of Munition Wastes,
W73-12877 5A

RESISTIVITY
Cathodic Protection for Coated Steel Pipelines,
W73-12765 8G

New Applications of Geophysical Methods to Ground-Water Problems in Pennsylvania,
W73-12783 2F

RESPIRATION
Physiology and Cytological Chemistry of Blue-Green Algae,
W73-12845 5C

RETENTION
Membrane Filter Retention--A Source of Error in the C-14 Method of Measuring Primary Production,
W73-12908 5A

RETURN FLOW
Herbicide Contamination of Surface Runoff Waters,
W73-12511 5B

RETURN (MONETARY)
Public Support of Private Water Resource Development in Agriculture--With Implications for Firm Growth,
W73-12698 4B

REVIEWS
Critical Review of Currently Available Water Quality Models,
W73-12352 6A

Ground Water Pollution in the South Central States,
W73-12515 5B

Pitfalls and Procedures in BOD Tests,
W73-12527 5A

New Trends in Waste Water Treatment and Recycle,

REYNOLDS NUMBER
Heated Sensors for Flow Measurements,
W73-12618 7B

RICE
Effect of Varying Water Management Practices on the Growth, Yield and Nitrogen Uptake by High-Yielding Rice Varieties,
W73-12583 3F

RICE (BROWN)
Protein Content of Brown Rice by Upland Polyethylene Film Mulching Culture, (In Japanese),
W73-12806 3F

RICE-M FIELDS
Aqueous Iron-Sulfur Systems in Rice Field Soils of Louisiana,
W73-12385 3F

RIPARIAN WATER LOSS
A Comparison of Rates of Water Loss Through Transpiration of Several Southern New Mexico Phreatophyte Species,
W73-12497 2D

RIVER BASIN DEVELOPMENT
The Multipurpose Development of the River Rhone Valley,
W73-12467 4A

RIVER BASINS
Factors Producing the Outstanding Spring Flood of 1970 in Upper Don River Basins (Usloviya formirovaniya vydayushchegosya vesennego polovod'ya 1970 g. v basseynakh rek verkhnego Dona),
W73-12440 2E

Some Hydrophysical Characteristics of Soils in the Don River Basin to Kazanskaya Station (Nekotoryye vodno-fizicheskiye kharakteristiki pochv basseyna r. Dona do st-tsy Kazanskoy),
W73-12443 2G

RIVER FORECASTING
Stage-Discharge Relations on Big Lost River Within National Reactor Testing Station, Idaho,
W73-12750 4A

RIVER LUGG
The Growth, Reproduction and Food of the Roach Rutilus rutilus (L.), of the River Lugg, Herefordshire,
W73-12921 8I

RIVERS
Trace Metal Baseline Studies on the Murderkill and St Jones Rivers, Delaware Coastal Plain,
W73-12959 5B

ROACH
The Growth, Reproduction and Food of the Roach Rutilus rutilus (L.), of the River Lugg, Herefordshire,
W73-12921 8I

ROAD CONSTRUCTION
Sediment Resulting From Construction of an Interstate Highway in the Piedmont Area of North Carolina,
W73-12713 4C

ROCK CRAB
Biology of Rock Crab (Cancer Irroratus) in Northumberland Strait,
W73-12390 2L

ROCK DRILLABILITY
Well Logs can Indicate Formation Drillability,
W73-12769 8E

ROCK SLOPE STABILITY
Evaluation of Hydraulic Properties of Rock Masses Influenced by Major Heterogeneities,
W73-12468 8E

ROCK STRUCTURES
Wave Transmission Through Rock Structures; Hydraulic Model Investigation,
W73-12563 8B

ROCKFILL DAMS
Simplified Calculation of Embankment Deformations,
W73-12473 8D

ROCKSLIDES
Catastrophic Rock Slide, Mount Huascaran, North-Central Peru, May 31, 1970,
W73-12409 2J

ROCKY MOUNTAIN REGION
Report on Arkansas Valley Conduit for Southeastern Colorado Water Conservancy District, Four Corners Regional Commission and U.S. Bureau of Reclamation.
W73-12577 4A

ROOT DEPTH
The Effect of Irrigation Depth on Root Growth of Some Pasture Species,
W73-12834 3F

ROOT GROWTH
The Effect of Irrigation Depth on Root Growth of Some Pasture Species,
W73-12834 3F

ROOT NODULES
Effects of Water Stress on Nitrogen-Fixing Root Nodules: IV. Effects on Whole Plants of Vicia faba and Glycine max,
W73-12977 3F

ROOTS
Water Pathways in Higher Plants: II. Water Pathways in Roots,
W73-12651 2I

ROTATIONS
Hydrophysical Properties and Water Regime of Crimean Southern Chernozems in a Field Crop Rotation (Vodno-fizicheskiye svoystva i vodnyy rezhim yuzhnykh chernozemov Kryma v polevom sevooborote),
W73-12744 2G

Water Regime in a Crop Rotation on Chernozem Soils in Southeast Russia (Vodnyy rezhim v sevooborote na chernozemnykh pochvakh Yugo-Vostoka),
W73-12747 2G

Influence of Certain Rotations Upon Cotton Production in the San Joaquin Valley,
W73-12975 3F

ROUGHNESS (HYDRAULIC)
Extreme Roughness of Natural River Channel,
W73-12416 8B

Effective Hydraulic Roughness for Channels Having Bed Roughness Different from Bank Roughness; A State-Of-The-Art Report,
W73-12565 8B

RURAL AREAS
A Study of Selected Aspects of Rural Water System Development in Mississippi,
W73-12492 6B

Economic and Related Impacts of Rural Water Systems in Mississippi,
W73-12493 6B

RURAL SOCIOLOGY
A Study of Selected Aspects of Rural Water System Development in Mississippi,
W73-12492 6B

Economic and Related Impacts of Rural Water Systems in Mississippi,
W73-12493 6B

RYE GRASS
Mayak, Russian Wild Ryegrass,
W73-12974 4A

SABLEFISH CULTURE
Preliminary Study of Sablefish Culture, A Potential New Industry,
W73-12373 8I

SAGEBRUSH
Extreme Water Stress and Photosynthetic Activity of the Desert Plant Artemisia Herba-Alba Asso,
W73-12785 2I

SALINE SODIC SOILS
Effect of Quality of Well Waters on the Germination and Mineral Composition of Wheat on Saline-Sodic Soils Rich in Magnesium,
W73-12809 3C

SALINE SOILS
Leaching Salty Soils,
W73-12789 2G

Sodium-Affected Soils in the Jordan Valley,
W73-12795 2G

The Effect of Soil Temperature on Plants Grown in Saline Soil,
W73-12797 2G

SALINE WATER
Corrosion of Metals in Tropical Waters---Structural Ferrous Metals,
W73-12772 8G

SALINE WATER INTRUSION
Prediction of Unsteady Salinity Intrusion in Estuaries: Mathematical Model and User's Manual,
W73-12728 2L

SALINITY
Ground Water Pollution in the South Central States,
W73-12515 5B

The Effect of Floodwater on Oysters in Mobile Bay,
W73-12658 5C

Mineral Pollution in the Colorado River Basin,
W73-12715 5B

A Hydrographic Atlas of Larger North Carolina Sounds,
W73-12948 2L

SALMONELLA
Salmonella Contamination of Rivers and Sewages in Fukuyama City, (In Japanese),
W73-12648 5C

SALT BALANCE
Field Leaching by Sprinkler and Surface Irrigation During a Crop Season,
W73-12464 3F

SALT TOLERANCE
Sodium Relations in Desert Plants: 1. Cation Contents of Some Plant Species from the Mojave and Great Basin Deserts,
W73-12792 2I

Sodium Relations in Desert Plants: 2. Distribution of Cations in Plant Parts of Three Different Species of Atriplex,
W73-12793 2I

SALT-VERDE BASIN (ARIZ.)
Valuation of Timber, Forage and Water from National Forest Lands,
W73-12701 6B

SALTBUSH
The Interrelationships of the Vegetation Characters of Four Salt Desert Shrub Associations of Colorado Plateau,
W73-12791 3B

Sodium Relations in Desert Plants: 2. Distribution of Cations in Plant Parts of Three Different Species of Atriplex,
W73-12793 2I

SALTS
Wind-Driven Model for Evaporite Deposition in a Layered Sea,
W73-12594 2J

Experimental Investigation of Rock Weathering by Salts,
W73-12733 2K

Salt Pollution of a Shallow Aquifer--Indianapolis, Indiana,
W73-12940 5B

SAMPLE PREPARATION
Aromatic Hydroxylation as an Analytical Reaction,
W73-12853 5A

Determination of Lead in Petroleum Additives Using Atomic Absorption Spectrophotometry,
W73-12864 5A

SAMPLE PRESERVATION
Sugar-Coated Daphnia: A Preservation Technique for Cladocera,
W73-12910 5A

SAMPLERS
Selectivity of Towed-Net Samplers,
W73-12669 7B

SAMPLING
Variable Sampling Frequency - A New Adaptive Technique,
W73-12616 7B

The Zooplankton of the Gulf of Guinea,
W73-12623 5A

Corrosion Monitoring Method Reduces Effect of Variables in Analyzing Oil Field Waters,
W73-12767 8G

Auger Soil Sampler for Herbicide Residues,
W73-12794 2G

SAN FRANCISCO BAY-DELTA
Proceedings of Seminar on Eutrophication and Biostimulation.
W73-12391 5C

SAN JOAQUIN VALLEY
Influence of Certain Rotations Upon Cotton Production in the San Joaquin Valley,
W73-12975 3F

SANITARY ENGINEERING
Waste Disposal Assembly,
W73-12454 5D

Encourage Applied Research and Publish the Findings,
W73-12758 5G

SARDINES
The Size at Maturity and Breeding Seasons of Sardines in Southern Lake Tanganyika,
W73-12649 2H

SARGASSO SEA
Bacterial Content of Particulate Matter in Offshore Surface Waters,
W73-12912 5B

SATURATION (SOILS)
Nomograph for the Saturation Percentage of Soil,
W73-12807 2G

SCANDINAVIA
Settleable Matter in Waste Water. Scan-W7:72.
W73-12530 5A

SCENERY
The Visual Aspects of Resource Management,
W73-12407 4D

SCHENECTADY COUNTY (NEW YORK)
Summary Report: Comprehensive Sewerage Study for Schenectady County, New York.
W73-12359 5G

SCHENECTADY (NEW YORK)
Comprehensive Public Water Supply Study for Schenectady County, New York.
W73-12358 3D

SCINTILLATION COUNTING
An Evaluation of Liquid Scintillation Counting Techniques for Use in Aquatic Primary Production Studies,
W73-12907 5A

SCOTLAND (MEDWAY ESTUARY)
Fungi Colonizing Wood Submerged in the Medway Estuary,
W73-12825 2L

SCREEN WAVE ABSORBERS
Reflection Characteristics of Screen Wave Absorbers; Hydraulic Model Investigation,
W73-12561 8B

SCREENS
Reflection Characteristics of Screen Wave Absorbers; Hydraulic Model Investigation,
W73-12561 8B

Wave Damping Effects of Fibrous Screens; Hydraulic Model Investigation,
W73-12564 8B

SEA WATER
Heat-Exchanger for Desalting Sea Water,
W73-12453 3A

Particulate Manganese in Sea Water Stressing Regimes in Marine Anoxic Basins,
W73-12854 5A

Bacterial Content of Particulate Matter in Offshore Surface Waters,
W73-12912 5B

Thorium in Water and Algae from the Adriatic Sea,
W73-12927 5A

SECONDARY PRODUCTIVITY
The Utilization of Leaf Litter by Stream Detritivores,
W73-12882 5C

Annual Life Cycle and Production of the Chaetognath Sagitta elegans in Bedford Basin, Nova Scotia,
W73-12898 5B

Annual Production of a Stream Mayfly Population: A Comparison of Methods,
W73-12905 5B

SEDIMENT CONTROL
Sediment Resulting From Construction of an Interstate Highway in the Piedmont Area of North Carolina,
W73-12713 4C

Standards for Soil Erosion and Sediment Control in New Jersey.
W73-12956 2J

SEDIMENT TRANSPORT
Bureau of Reclamation Procedures for Predicting Sediment Yield,
W73-12479 2J

Forecasting Storm-Induced Beach Changes Along Virginia's Ocean Coast,
W73-12584 4A

Computer Models of Delta Growth Due to Sediment Input From Rivers and Longshore Transport,
W73-12592 2J

Sediment Resulting From Construction of an Interstate Highway in the Piedmont Area of North Carolina,
W73-12713 4C

SEDIMENT-WATER INTERFACES
Sediment-Water Nutrient Interchange in Eutrophic Lakes,
W73-12395 5C

The Nitrogen Cycle in Sediment-Water Systems,
W73-12843 5C

Carbon Cycle in Sediment-Water Systems,
W73-12846 5C

SEDIMENTARY STRUCTURES
Characteristic Physical and Biogenic Sedimentary Structures in Georgia Estuaries,
W73-12410 2L

SEDIMENTATION
Glacial Environment and Processes in Southeastern Alaska,
W73-12423 2C

Bureau of Reclamation Procedures for Predicting Sediment Yield,
W73-12479 2J

History of Sedimentation in Montsweag Bay,
W73-12740 2L

Lithium Silicate Sedimentation Tracer for Shoal Deposit Studies,
W73-12862 5B

SEDIMENTOLOGY
Biogeochemistry of Sediments of Delaware Bay,
W73-12739 2L

SEDIMENTS
The Sediments and History of Lake Butte des Morts, Wisconsin,
W73-12355 2J

Aspects of the Biogeochemistry of Carbohydrates and Proteins in Aquatic Environments,

Insecticide Residues in Water and Sediment from Cisterns on the U.S. and British Virgin Islands c 1970,
W73-12894 5B

SEEDS
Delayed Seed Dispersal and Rapid Germination as Survival Mechanisms of the Desert Plant Blepharis Persica (Burm.) Kuntze,
W73-12787 2I

SEEPAGE
Analysis of Seepage Into Ground-Water System,
W73-12412 4B

Hydrologic Models for Poorly Defined Drainage Areas,
W73-12496 2A

SEEPAGE CONTROL
Control of Underseepage by Relief Wells, Trotters, Mississippi; Appendix K: 1969 Pumping Tests,
W73-12597 8B

SEICHES
Long Wave Propagation in Idealized Estuary,
W73-12417 2L

SEISMIC PROPERTIES
Vertical Dynamic Response of Embeded Footings,
W73-12487 8C

SEISMIC STUDIES
Vertical Dynamic Response of Embeded Footings,
W73-12487 8C

SELECTIVE WITHDRAWAL
Selective Withdrawal from Man-Made Lakes, Hydraulic Laboratory Ivestigation,
W73-12569 4A

SELENIUM
Selenium in the Environment,
W73-12614 5C

Optimum Procedure for the Determination of Selenium in Biological Specimens Using Se-77m Neutron Activation,
W73-12876 5A

SEMI-INFINITE AQUIFERS
Waste Disposal Well Performance,
W73-12779 5E

SENSITIVITY
Sensitivity and Detectability Limits for Elemental Analysis by Proton-Induced X-Ray Fluorescence with a 3 Mv Van de Graaff,
W73-12935 5A

SENSORS
Water Quality Determinations in the Virgin Islands from ERTS-A Data,
W73-12630 5A

SEPARATION TECHNIQUES
Fluidized Bed Clarification as Applied to Wastewater Treatment,
W73-12505 5D

Steam Distillation: A Simple Technique for Recovery of Petroleum Hydrocarbons from Tainted Fish,
W73-12849 5A

Polyaromatic Hydrocarbons in High-Boiling Petroleum Distillates. Isolation by Gel Permeation Chromatography and Identification by Fluorescence Spectrometry,
W73-12875 5A

Determination of Uranium in Urine Specimens Following Their Separation Through Anion Exchange, (Bestimmung Des Urans in Urinproben Nach Dessen Abtrennung Durch Anionenaustausch),
W73-12931 5A

SEPTIC TANKS
Factors Affecting the Percolation Test,
W73-12716 5B

SETTLEMENT (STRUCTURAL)
Simplified Calculation of Embankment Deformations,
W73-12473 8D

SETTLING BASINS
Demostration of a Waste Disposal System for Livestock Waste,
W73-12517 5D

Sediment Resulting From Construction of an Interstate Highway in the Piedmont Area of North Carolina,
W73-12713 4C

SEVERN RIVER (ENGLAND)
Climatic Change and Arrested Meander Development on the River Severn,
W73-12737 4A

SEWAGE
Use of Coliphages as Indicators of Water pollution,
W73-12525 5A

Salmonella Contamination of Rivers and Sewages in Fukuyama City, (In Japanese),
W73-12648 5C

Construction Costs of Water Supply and Sewage Networks in Poland--1961-1970,

W73-12839 6A

SKAHA LAKE

Crustacean Plankton and the Eutrophication of Lakes in the Okanagan Valley, British Columbia,
W73-12624 5C

SLABS

Strength Analysis of Corner Column-Slab Connections,
W73-12465 8A

SLOPE PROTECTION

Stone and Woodchip Mulches for Erosion Control on Construction Sites,
W73-12463 4D

SLOPE STABILIZATION

Stone and Woodchip Mulches for Erosion Control on Construction Sites,
W73-12463 4D

SLOPES

Terracettes: A Suggested Classification,
W73-12731 2J

SLOPING LAND

Application of Acrylic Plastic Tension Lysimeters to Sloping Land,
W73-12638 2G

SLUDGE BLANKET

Fluidized Bed Clarification as Applied to Wastewater Treatment,
W73-12505 5D

SLUDGE BULKING

Phosphorus Removal and Plant Operation Studies at Fort Wayne, Indiana,
W73-12500 5D

SLUDGE DIGESTION

Stabilization of Sewage Solids by the Channel Aeration Process,
W73-12502 5D

SLUDGE DISPOSAL

Study of Utilization and Disposal of Lime Sludges Containing Phosphates,
W73-12501 5D

Stabilization of Sewage Solids by the Channel Aeration Process,
W73-12502 5D

Methods for Pulp and Paper Mill Sludge Utilization and Disposal,
W73-12519 5E

Land Disposal of Liquid Sewage Sludge: I. The Effect on Yield, in Vivo Digestibility, and Chemical Composition of Coastal Bermudagrass (Cynodon dactylon L. Pers.),
W73-12914 5D

SLUDGE TREATMENT

An Efficient Method of Dewatering Effluent Sediments (Effektivnyi Sposob Obezvozhivaniya Osadkov Stochnikh Vod),
W73-12674 5E

SLURRY PONDS

Control of Mine Drainage from Coal Mine Mineral Wastes - Phase II - Pollution Abatement and Monitoring,
W73-12516 5G

SMALL WATERSHEDS

Results of a Study of Water Regime of Soils on Small Watersheds in the Don River Basin (Rezul'taty izucheniya vodnogo rezhima pochv malykh vodosborov v basseyne r. Dona),
W73-12441 2G

Preliminary Flood-Frequency Relations for Small Streams in Georgia,
W73-12946 4A

SNOW

Tritium and Deuterium Content of the Snow in Groenland,
W73-12418 5B

Green Snow and Ice From the Antarctica,
W73-12644 2I

Trials on Trends Through Clusters of Cirques,
W73-12732 2J

Estimating Snow-Water Equivalent from Point-Density Measurements of Forest Stands,
W73-12827 4A

SNOW COVER

Snow Cover of the Issyk-kul' Depression and Its Alpine Environment (Snezhnyy pokrov Issyk-Kul'skoy kotloviny i yeye vysokogornogo obramleniya),
W73-12726 2C

SNOWFALL

Tritium and Deuterium Content of the Snow in Groenland,
W73-12418 5B

SNOWLINES

Trials on Trends Through Clusters of Cirques,
W73-12732 2J

SNOWMELT

Investigation of Thermal Properties of Soils in the Don River Basin for Estimation of Snowmelt Losses to Infiltration Into Frozen Soil (Issledovaniye teplovykh svoystv pochv basseyna r. Dona dlya otsenki poter' talykh vod na in fil'tratsiyu v merzluyu pochvu),
W73-12436 2G

Evaporation During a Flood Period Caused by Spring Snowmelt (Ispareniye v period vesennego snegotayaniya i polovod'ya),
W73-12442 2D

SNOWPACKS

Snow Cover of the Issyk-kul' Depression and Its Alpine Environment (Snezhnyy pokrov Issyk-Kul'skoy kotloviny i yeye vysokogornogo obramleniya),
W73-12726 2C

SOCIAL CHANGE

Economic and Related Impacts of Rural Water Systems in Mississippi,
W73-12493 6B

SOCIAL INDICATORS

Environmental Quality Indicators and Social Indicators,
W73-12679 6B

SOCIAL VALUES

Water Resource Decison Making--How Effective is the Public Input,
W73-12693 6B

Determination of Public Environmental Preferences in Water Resources Planning and Development,
W73-12706 6B

SOCKEYE SALMON

The Effects of Sublethal Concentrations of Whole Bleached Kraftmill Effluent on the Growth and Food Conversion Efficiency of Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-12913 5C

SODIUM

Sodium Relations in Desert Plants: 1. Cation Contents of Some Plant Species from the Mojave and Great Basin Deserts,
W73-12792 2I

Sodium Relations in Desert Plants: 2. Distribution of Cations in Plant Parts of Three Different Species of Atriplex,
W73-12793 2I

SODIUM CHLORIDE

Recondition and Reuse of Organically Contaminated Waste Sodium Chloride Brines,
W73-12521 5D

SOIL ANALYSIS
Auger Soil Sampler for Herbicide Residues,
W73-12794 2G

SOIL CONSERVATION
Economics in Soil and Water Conservation,
W73-12691 3F

Cenchrus Ciliaris--A Perennial Pasture Grass of Arid and Semi-Arid Areas,
W73-12790 4A

SOIL DISPOSAL FIELDS
Water Quality Hydrology of Lands Receiving Farm Animal Wastes,
W73-12353 5B

SOIL DYNAMICS
Time Effects on Dynamic Shear Modulus of Clays,
W73-12477 2G

Vertical Dynamic Response of Embeded Footings,
W73-12487 8C

SOIL EROSION
Standards for Soil Erosion and Sediment Control in New Jersey.
W73-12956 2J

SOIL EXTRACTS
Determination of Ammonium in Soil Extracts and Water Samples by an Ammonia Electrode,
W73-12939 2G

SOIL MOISTURE
Problems in the Production of a Spring Flood (Voprosy formirovaniya vesennego polovod-'ya).
W73-12435 4A

Results of a Study of Water Regime of Soils on Small Watersheds in the Don River Basin (Rezul'taty izucheniya vodnogo rezhima pochv malykh vodosborov v basseyne r. Dona),
W73-12441 2G

Methods of Determining Soil Moisture Storage in Winter (K metodike opredeleniya vlagozapasov pochvy v zimniy period goda),
W73-12444 2G

Effects of Air Gaps and Saturated Voids on Accuracy of Neutron Moisture Measurements,
W73-12636 2G

Effects of Various Soil Moisture Regimes and Different Levels of Nitrogen and Different Spacings of the Quality of Potato Tubers (Solanum Tuberosum L.),
W73-12640 3F

Characteristics of Water Migration in a Thick Leached Chernozem (Osobennosti dvizheniya vody v vyshchelochennom moshchnom chernozeme),
W73-12743 2G

Water Regime in a Crop Rotation on Chernozem Soils in Southeast Russia (Vodnyy rezhim v sevooborote na chernozemnykh pochvakh Yugo-Vostoka),
W73-12747 2G

Delayed Seed Dispersal and Rapid Germination as Survival Mechanisms of the Desert Plant Blepharis Persica (Burm.) Kuntze,
W73-12787 2I

Auger Soil Sampler for Herbicide Residues,
W73-12794 2G

Effect of Level of Soil Moisture on Nitrogen Mineralization and Nitrification During Incubation of East Pakistan Tea Soils,
W73-12799 3F

Effect of Soil Moisture on the Growth of Macrophomina Phaseoli, Sclerotium Rolfsii and Fausarium Solani in Soil,
W73-12831 3F

Water Potential in Red Pine: Soil Moisture, Evapotranspiration, Crown Position,
W73-12837 2I

SOIL PHYSICAL PROPERTIES
Some Hydrophysical Characteristics of Soils in the Don River Basin to Kazanskaya Station (Nekotoryye vodno-fizicheskiye kharakteristiki pochv basseyna r. Dona do st-tsy Kazanskoy),
W73-12443 2G

Hydrophysical Properties and Water Regime of Crimean Southern Chernozems in a Field Crop Rotation (Vodno-fizicheskiye svoystva i vodnyy rezhim yuzhnykh chernozemov Kryma v polevom sevooborote),
W73-12744 2G

SOIL PHYSICS
Characteristics of Water Migration in a Thick Leached Chernozem (Osobennosti dvizheniya vody v vyshchelochennom moshchnom chernozeme),
W73-12743 2G

SOIL TEMPERATURE
The Effect of Soil Temperature on Plants Grown in Saline Soil,
W73-12797 2G

SOIL TESTS
Time Effects on Dynamic Shear Modulus of Clays,
W73-12477 2G

SOIL TREATMENT
Methods for Pulp and Paper Mill Sludge Utilization and Disposal,
W73-12519 5E

Significance of Heating Agricultural Soils,
W73-12802 3F

SOIL TYPES
Sodium-Affected Soils in the Jordan Valley,
W73-12795 2G

SOIL WATER
Diurnal and Seasonal Effects of Environment on Plant Water Relations and Fruit Diameter of Citrus,
W73-12805 3F

Nomograph for the Saturation Percentage of Soil,
W73-12807 2G

SOIL WATER MOVEMENT
Theory of Water Movement in Soils: 10. Cavities with Constant Flux,
W73-12600 2G

Characteristics of Water Migration in a Thick Leached Chernozem (Osobennosti dvizheniya vody v vyshchelochennom moshchnom chernozeme),
W73-12743 2G

Water Regime in a Crop Rotation on Chernozem Soils in Southeast Russia (Vodnyy rezhim v sevooborote na chernozemnykh pochvakh Yugo-Vostoka),
W73-12747 2G

SOIL-WATER-PLANT RELATIONSHIPS
Water Regime in a Crop Rotation on Chernozem Soils in Southeast Russia (Vodnyy rezhim v sevooborote na chernozemnykh pochvakh Yugo-Vostoka),
W73-12747

Extreme Water Stress and Photosynthetic Activity of the Desert Plant Artemisia Herba-Alba Asso,
W73-12785 2I

SOIL-WATER STRESS
Germination of Wheat as Affected by Soil Water Stress,
W73-12884 3F

SOIL-WATER SYSTEM
Nomograph for Hydraulic Conductivity and Intrinsic Permeability of Water-Soil System,
W73-12808 2G

SOILS
Problems in the Production of a Spring Flood (Voprosy formirovaniya vesennego polovod-'ya).
W73-12435 4A

Investigation of Thermal Properties of Soils in the Don River Basin for Estimation of Snowmelt Losses to Infiltration Into Frozen Soil (Issledovaniye teplovykh svoystv pochv basseyna r. Dona dlya otsenki poter' talykh vod na in fil'tratsiyu v merzluyu pochvu),
W73-12436 2G

Some Hydrophysical Characteristics of Soils in the Don River Basin to Kazanskaya Station (Nekotoryye vodno-fizicheskiye kharakteristiki pochv basseyna r. Dona do st-tsy Kazanskoy),
W73-12443 2G

Erodibility of Hill Soils of Sutlej Catchment Area in Himachal Pradesh,
W73-12635 2J

Application of Acrylic Plastic Tension Lysimeters to Sloping Land,
W73-12638 2G

The Effect of Adsorbents on the Rate of Degradation of Herbicides Incubated with Soil,
W73-12656 5B

SOILS (LATERITE)
Influence of Moisture Regime on the Genesis of Laterite Soils in South Inida: II. Clay Composition and Mineralogy,
W73-12721 2G

SOLAR RADIATION
Optical Properties and Color of Lake Tahoe and Crater Lake,
W73-12926 5A

SOLIDS CONTACT PROCESSES
Fluidized Bed Clarification as Applied to Wastewater Treatment,
W73-12505 5D

SOLVENT EXTRACTIONS
An Improved Method For Determining Organics by Activated Carbon Adsorption and Solvent Extraction - Pt. II (Test Method),
W73-12866 5A

SONIC TRANSIT TIME LOG
Well Logs can Indicate Formation Drillability,
W73-12769 8E

SOUNDS
A Hydrographic Atlas of Larger North Carolina Sounds,
W73-12948 2L

SOUTH CAROLINA
Functional Water and Sewerage Plan and Program, Pee Dee Region, South Carolina.
W73-12365 5G

A Topologically Optimum River Sampling Plan for South Carolina,
W73-12498 5B

Determination of Public Environmental Preferences in Water Resources Planning and Development,
W73-12706 6B

Length-Weight Relationship and Condition Factors of Fishes From a South Carolina Reservoir Receiving Thermal Effluent,
W73-12774 5C

SOUTH CAROLINA (PRATERS CREEK)
The Influence of Organic Drift on the Food Habits and Life History of the Yellowfin Shiner, Notropis Lutipinnis (Jordan and Brayton),
W73-12844 2I

SOUTH-CENTRAL US
Ground Water Pollution in the South Central States,
W73-12515 5B

SOUTH SASKATCHEWAN RIVER
Uptake of Mercury by Caged Rainbow Trout (Salmo Gairdneri) in the South Saskatchewan River,
W73-12857 5C

SOYBEAN OIL
Treatment of Soybean Oil Soapstock to Reduce Pollution,
W73-12668 5D

SOYBEANS
Effects of Water Stress on Nitrogen-Fixing Root Nodules: IV. Effects on Whole Plants of Vicia faba and Glycine max,
W73-12977 3F

SPAIN (MURCIA)
Determination of Exchangeable Cations in Calcareous Soils,
W73-12786 2G

SPARTINA-M DIEBACK
Bacteria of Muds Colonized by Spartina Townsendii and their Possible Role in Spartina Die-Back,
W73-12705 2L

SPATIAL DISTRIBUTION
Community Structure of the Benthos in Scottish Sea-Lochs. II. Spatial Pattern,
W73-12855 5C

SPAWNING
Investigations on American Shad in the St. Johns River,
W73-12370 2H

SPECIATION
The Association of Amphipods in the Shallow-Water Sand Habitat of Strangford Lough, Co. Down,
W73-12879 5A

Description and Ecology of Hyaiella Texana N. Sp. (Crustacea: Amphipoda) from the Edwards Plateau of Texas,
W73-12900 2I

Some Marine Diatoms from the Galapagos Islands,
W73-12902 2I

SPECIES DIVERSITY
The Zooplankton of the Gulf of Guinea,
W73-12623 5A

SPECIES LEAF SURFACE AREA
A Comparison of Rates of Water Loss Through Transpiration of Several Southern New Mexico Phreatophyte Species,
W73-12497 2D

SPECTROPHOTOMETRY
Additional Studies for the Spectrophotometric Measurement of Iodine in Water.
W73-12851 5A

Spectrophotometric Determination of Ammonia,
W73-12886 5A

SPILLWAYS
Spillway for Oakley Dam, Sangamon River, Illinois-Appendix A: Type 2 (Revised) Spillway,
W73-12582 8A

SPOIL BANKS
Delaware Estuary, Pennsylvania, New Jersey, and Delaware, Long-Range Dredged Spoil Disposal Problem.
W73-12560 5E

Disposal of Dredge Spoil; Problem Identification and Assessment and Research Program Development,
W73-12573 4A

SPRAYING
Electrostatic Crop Spraying,
W73-12482 3F

SPRING
Problems in the Production of a Spring Flood (Voprosy formirovaniya vesennego polovod-'ya).
W73-12435 4A

Factors Producing the Outstanding Spring Flood of 1970 in Upper Don River Basins (Usloviya formirovaniya vydayushchegosya vesennego polovod'ya 1970 g. v basseynakh rek verkhnego Dona),
W73-12440 2E

Evaporation During a Flood Period Caused by Spring Snowmelt (Ispareniye v period vesennego snegotayaniya i polovod'ya),
W73-12442 2D

SPRINKLER IRRIGATION
Field Leaching by Sprinkler and Surface Irrigation During a Crop Season,
W73-12464 3F

Improvements in Moving Sprinkler Irrigation Systems for Conservation of Water,
W73-12507 3F

SPRUCE FIR
Estimating Snow-Water Equivalent from Point-Density Measurements of Forest Stands,
W73-12827 4A

ST. CLAIR RIVER (MICH)
Effects of Submerged Sills in the St. Clair River; Hydraulic Model Investigation,
W73-12572 8B

ST. JONES RIVER (DEL)
Trace Metal Baseline Studies on the Murderkill and St Jones Rivers, Delaware Coastal Plain,
W73-12959 5B

ST. LAWRENCE SEAWAY
Toward a Regional Policy for the Great Lakes,
W73-12963 6B

ST. LOUS HARBOR (MO)
Shoaling Conditions, St. Louis Harbor, Mississippi River; Hydraulic Model Investigation,
W73-12570 8B

STABLE ISOTOPES
An Investigation of the Nitrate Problem in Runnels County, Texas,
W73-12514 5B

STAGE-DISCHARGE RELATIONS
Extreme Roughness of Natural River Channel,
W73-12416 8B

Stage-Discharge Relations on Big Lost River Within National Reactor Testing Station, Idaho,
W73-12750 4A

STANDARDS
The Role of Uniform Standards in International Environmental Management.
W73-12686 6B

STANDING CROPS
Annual Production of a Stream Mayfly Population: A Comparison of Methods,
W73-12905 5B

STATISTICAL METHODS
The Set up of the Statistical System Within Which the Deterioration of the Human Environment will be Estimated,
W73-12681 6B

Trials on Trends Through Clusters of Cirques,
W73-12732 2J

STEAM DISTIALLATION
Steam Distillation: A Simple Technique for Recovery of Petroleum Hydrocarbons from Tainted Fish,
W73-12849 5A

STEEL INDUSTRY
A Study of the Economic Impact on the Steel Industry of the Costs of Meeting Federal Air and Water Pollution Abatement Requirements. Part I - Executive Summary.
W73-12707 5G

STEEL STRUCTURES
High Strength Bolted Galvanized Joints,
W73-12489 8G

STILLING BASINS
Outlet Works Stilling Basin for Tallahala Dam, Tallahala Creek, Mississippi; Hydraulic Model Investigation,
W73-12568 8B

STIMULATION
Electrical Stimulation of Microbial Waste Treatment,
W73-12503 5D

STOCKYARDS
Demostration of a Waste Disposal System for Livestock Waste,
W73-12517 5D

STORAGE COEFFICIENT
Flow to Wells Near Streams in the Presence of Delayed Yield From Storage and Analysis of Pumping Test Data,
W73-12943 4B

STORM CLOUDS
Water Content in Convective Storm Clouds,
W73-12536 2B

STORMS
Forecasting Storm-Induced Beach Changes Along Virginia's Ocean Coast,
W73-12584 4A

STRAHLERS LAW
Some Examples of Drainage Component Analysis,
W73-12734 4A

STRATIFIED FLOW
Observations of Intermediate and Small Scale Turbulent Water Motion in a Stratified Estuary (Parts I and II),
W73-12424 2L

Selective Withdrawal from Man-Made Lakes, Hydraulic Laboratory Ivestigation,
W73-12569 4A

STREAM CHANNELING
Effects of Stream Channeling on Wetlands in a Minnesota Watershed,
W73-12667 4A

STREAMFLOW
A Proposed Streamflow Data Program for Connecticut,
W73-12748 4A

Stage-Discharge Relations on Big Lost River Within National Reactor Testing Station, Idaho,
W73-12750 4A

STRESS ANALYSIS
Stresses in the Body and Foundations of Prestressed Dams,
W73-12475 8A

STRESS DISTRIBUTION
Stress Distribution Around a Tunnel Situated in a Layer Under the Action of Gravity,
W73-12490 8E

STRUCTURAL ANALYSIS
Tests of Selected Insulating Materials for Mass Concrete,
W73-12431 8F

Strength Analysis of Corner Column-Slab Connections,
W73-12465 8A

STRUCTURAL CONCRETE
Strength Analysis of Corner Column-Slab Connections,
W73-12465 8A

STRUCTURAL DESIGN
Guide for the Design of Aluminum Transmission Towers.
W73-12485 8C

STRUCTURAL STEEL
Welding of a Normalized High Strength Low Alloy Plate Steel of Structural Quality,
W73-12466 8G

High Strength Bolted Galvanized Joints,
W73-12489 8G

SUBMARINE CANYONS
Sea Floor Off Magdalena Delta and Santa Marta Area, Colombia,
W73-12591 2J

SUBMERGED SILLS
Effects of Submerged Sills in the St. Clair River; Hydraulic Model Investigation,
W73-12572 8B

SUBSTRATE UTILIZATION
The Mechanisms of Nitrogen Assimilation in Pseudomonads,
W73-12881 5C

A Relationship between Heterotrophic Utilization of Organic Acids and Bacterial Populations in West Blue Lake, Manitoba,
W73-12903 5C

SUBSURFACE DRAINAGE
Leaching of Cement from a Concrete Pile Section by Groundwater Flow,
W73-12766 8F

SUCCESSION
Some Effects of Artificial Fertilization on Enclosed Plankton Populations in Marion Lake, British Columbia,
W73-12384 5C

SUCROSE
Sugar-Coated Daphnia: A Preservation Technique for Cladocera,
W73-12910 5A

SUISUN BAY (CALIF.)
Mathematical modeling of Phytoplankton Populations,
W73-12399 5C

SULFATE SOILS
Morphology, Genesis, Occurrence and Agricultural Potential of Acid Sulphate Soils in Central Thailand,
W73-12818 2G

SULFER BACTERIA
Corrosion by the Sulphate-Reducing Bacteria,
W73-12756 5G

SULFITE LIQUORS
Waste Treatment Plant at ITT Rayonier Inc. Mill, Fernandina Beach, Florida.
W73-12541 5D

Volatile Biochemical Oxygen-Consuming Materials Occurring in the Sulfite Process with Liquor Neutralization and Condensate Recovery: Theoretical Study, (Flyktiga biokemisk syreforbrukande amnens upptradande i sulfitprocessen vid lutneutralisering och kondensataterforing, Teoretisk undersokning),
W73-12546 5D

SULFITE MILLS
Waste Treatment Plant at ITT Rayonier Inc. Mill, Fernandina Beach, Florida.
W73-12541 5D

SULFITE PULPING
Methods for the Further Improvement of Spent Liquor Recovery in Lenzing,
W73-12524 5D

Rayonier Makes Major Breakthrough in Sulfite Pollution Control.
W73-12542 5D

SURFACANTS
Micellar Solutions Stimulate Wells,
W73-12762 8B

SURFACE AERATION
Stabilization of Sewage Solids by the Channel Aeration Process,
W73-12502 5D

SURFACE-GROUNDWATER RELATIONSHIPS
An Approach to Hydrogeologic Investigations of River Alluvium by the Use of Computerized Data Processing Techniques,
W73-12942 2A

Flow to Wells Near Streams in the Presence of Delayed Yield From Storage and Analysis of Pumping Test Data,
W73-12943 4B

SURFACE IRRIGATION
Field Leaching by Sprinkler and Surface Irrigation During a Crop Season,
W73-12464 3F

SURFACE PITS
Problems of Groundwater Pollution by Brine,
W73-12770 5B

SURFACE WATERS
Hydrological Year-Book of Israel, 1970/71.
W73-12432 2A

Hydrologic Records for Lake County, Florida: 1971-72,
W73-12949 2E

SURFACTANTS
Bacterial Degradation of Detergent Compounds,
W73-12938 5B

SURVEYS
Biological Aspects of Lead: An Annotated Bibliography - Literature From 1950 through 1964. Parts I and II,
W73-12627 5C

Determination of Public Environmental Preferences in Water Resources Planning and Development,
W73-12706 6B

SUSPENDED SOLIDS
Waste Water Treatment in Commercial Fish Processing: Reducing Stick Water Loadings,
W73-12420 5D

Circular Flotation System,
W73-12457 5D

Waste Treatment System,
W73-12461 5D

Settleable Matter in Waste Water. Scan-W7:72.
W73-12530 5A

Stream-Velocity Effects on the Heavy-Metal Concentrations,
W73-12870 5B

SWEDEN
Environmental Care at Pulp Mills, Results and Expectations,
W73-12545 5D

SWEET POTATOES
Characterization of Sweet Potato Processing Wastes,
W73-12852 5A

SWIMMING
Swimming Performance of Young Atlantic Salmon (Salmo salar) as Affected by Reduced Ambient Oxygen Concentration,
W73-12897 5C

SYMPOSIUM (OREGON STATE UNIV)
Heavy Metals in the Environment.
W73-12604 5B

SYNCHRONOUS MACHINES
An Electric Conversion for Mechanical Hydraulic Governors of Water Wheel Turbines,
W73-12469 8C

SYSTEMATICS
The Association of Amphipods in the Shallow-Water Sand Habitat of Strangford Lough, Co. Down,
W73-12879 5A

Description and Ecology of Hyaiella Texana N. Sp. (Crustacea: Amphipoda) from the Edwards Plateau of Texas,
W73-12900 2I

SYSTEMS ANALYSIS
Systems Approach to Metropolitan and Regional Area Water and Sewer Planning,
W73-12351 6A

Annual Literature Review: Administration, Systems Analysis,
W73-12840 5G

TALLAHALA DAM (MISS)
Outlet Works Stilling Basin for Tallahala Dam, Tallahala Creek, Mississippi; Hydraulic Model Investigation,
W73-12568 8B

TANANA RIVER (ALAS)
Chena River Lakes Project, Alaska, Problems Relating to Channel Development, Erosion, and Bank and Levee Protection,
W73-12559 8B

TANNERY WASTES
Water Decolorization,
W73-12446 5D

TEMPERATURE
Effects of Light and Temperature on Algal Growth,
W73-12396 5C

Mortality Curves of Bluegills (Lepomis Macrochirus Rafinesque) Simultaneously Exposed to Temperature and Zinc Stress,
W73-12637 5C

Resistance in Digitaria to Yellow Sugarcane Aphid, Siphaflava (Forbes) as Related to Temperature and Rainfall,
W73-12643 2I

TENNESSEE
Hydraulics of Sheetlike Solution Cavities,
W73-12944 4B

TENNESSEE (CUMBERLAND RIVER)
Fishes of the Big South Fork of the Cumberland River,
W73-12820 4C

TENNESSEE RIVER
Mussels in the Unique Nickajack Dam Construction Site, Tennessee River, 1965,
W73-12800 2I

TENSIOMETERS
Evaluation of Tensiometers for Estimating Plant Water Stress in Citrus,
W73-12985 3F

TERRACETTES
Terracettes: A Suggested Classification,
W73-12731 2J

TERRAIN ANALYSIS
A Suggested New Approach to the Analysis of Drainage Basin Shapes,
W73-12729 4A

TERTIARY TREATMENT
Study of Utilization and Disposal of Lime Sludges Containing Phosphates,
W73-12501 5D

Tertiary Treatment of Combined Domestic and Industrial Wastes,
W73-12512 5D

The Shagawa Lake Project: Lake Restoration by Nutrient Removal from Wastewater Effluent,
W73-12520 5D

TESTING PROCEDURES
Water Pollution in the Pulp and Paper Industry. II. Testing Methods,
W73-12554 5A

TEXAS
Water Quality Hydrology of Lands Receiving Farm Animal Wastes,
W73-12353 5B

Identification of Water Resources Planning Problems in the Metropolitan Area of Greater San Antonio and Its Associated Counties,
W73-12354 6B

An Investigation of the Nitrate Problem in Runnels County, Texas,
W73-12514 5B

Presidio Bolson, Trans-Pecos Texas and Adjacent Mexico: Geology of a Desert Basin Aquifer System,
W73-12585 2F

Long-Lived Pollutants in Sediments From the Laguna Atascosa National Wildlife Refuge, Texas,
W73-12595 5B

Auger Soil Sampler for Herbicide Residues,
W73-12794 2G

Description and Ecology of Hyaiella Texana N. Sp. (Crustacea: Amphipoda) from the Edwards Plateau of Texas,
W73-12900 2I

THAILAND
Morphology, Genesis, Occurrence and Agricultural Potential of Acid Sulphate Soils in Central Thailand,
W73-12818 2G

THAMES RIVER (U.K.)
River Thames Antipollution: Boardmakers Install World's Largest Tidal River Surface Aerator.
W73-12548 5G

Aeration of the Thames.
W73-12549 5G

Large Surface Aerator Designed to Condition Board Mill Effluent.
W73-12550 5G

THAWING
Laboratory Investigations of the Transmission Capacity of Frozen and Thawed Soils Based on Data of the Valday Field Laboratory (Vnigl) (Laboratornyye issledovaniya vodopropusknoy sposobnosti merzlykh i talykh pochvo-gruntov (po materialam merzlothoy laboratorii VNIGL)),
W73-12437 2G

THEORETICAL ANALYSIS
Identification of the Limiting Nutrient and Specific Growth Rate,
W73-12861 5C

THERMAL CONDUCTIVITY
Heated Sensors for Flow Measurements,
W73-12618 7B

THERMAL DESTRATIFICATION
Artificial Reservoir Destratification Effects on Phytoplankton,
W73-12895 5C

THERMAL EFFLUENTS
Length-Weight Relationship and Condition Factors of Fishes From a South Carolina Reservoir Receiving Thermal Effluent,
W73-12774 5C

THERMAL EXPANSION
Tests of Selected Insulating Materials for Mass Concrete,
W73-12431 8F

THERMAL INSULATION
Tests of Selected Insulating Materials for Mass Concrete,
W73-12431 8F

THERMAL POLLUTION
Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-12506 5B

THERMAL PROPERTIES
Investigation of Thermal Properties of Soils in the Don River Basin for Estimation of Snowmelt Losses to Infiltration Into Frozen Soil (Issledovaniye teplovykh svoystv pochv basseyna r. Dona dlya otsenki poter' talykh vod na in fil'tratsiyu v merzluyu pochvu),
W73-12436 2G

THERMAL STRESS
Physiological Changes in Mytilus Edulis L. Induced by Temperature and Nutritive Stress,
W73-12878 5C

Effect of Incubation Temperature on the Macromolecular and Lipid Content of the Phytoflagellate Ochromonas danica,
W73-12896 5C

THERMAL WATER
Silica In Thermal and Cold Waters (Kremnezem v termal'nykh i kholodnykh vodakh),
W73-12751 2K

THIN LAYER CHROMATOGRAPHY
Polyaromatic Hydrocarbons in High-Boiling Petroleum Distillates. Isolation by Gel Permeation Chromatography and Identification by Fluorescence Spectrometry,
W73-12875 5A

THORIUM
Thorium in Water and Algae from the Adriatic Sea,
W73-12927 5A

TIDAL EFFECTS
The Computation of Tides and Currents in Estuaries and Canals,
W73-12428 2L

TIDAL WATERS
Estuarine Navigation Projects.
W73-12575 8B

TIDES
Long Wave Propagation in Idealized Estuary,
W73-12417 2L

Effects of Proposed Dock Expansion at Newport News on Tides, Currents, and Shoaling; Hydraulic Model Investigation,
W73-12566 8B

TISSUE
Optimum Procedure for the Determination of Selenium in Biological Specimens Using Se-77m Neutron Activation,
W73-12876 5A

TNT
Application of Liquid Chromatography to Pollution Abatement Studies of Munition Wastes,
W73-12877 5A

TOPOGRAPHY
Climatic Change and Arrested Meander Development on the River Severn,
W73-12737 4A

TOPOLOGICALLY OPTIMUM PLAN
A Topologically Optimum River Sampling Plan for South Carolina,
W73-12498 5B

TOXICITY
Detoxification of Kraft Pulp Mill Effluent by an Aerated Lagoon,
W73-12529 5D

Environmental Contamination by Toxic Metals,
W73-12605 5B

Some Short-Term Indicators of Sublethal Effects of Copper on Brook Trout, Salvelinus Fontinalis,
W73-12859 5C

Stream-Velocity Effects on the Heavy-Metal Concentrations,
W73-12870 5B

The Use of Fish as Sensors in Industrial Waste Lines to Prevent Fish Kills,
W73-12889 5C

The Reduction of Copper Toxicity in a Marine Copepod by Sediment Extract,
W73-12909 5C

TOXICOLOGICAL STUDIES
Mercury in Fish: Some Toxicological Considerations,
W73-12826 5C

TOXICOLOGY
Biological Aspects of Lead: An Annotated Bibliography - Literature From 1950 through 1964. Parts I and II,
W73-12627 5C

TRACE ELEMENTS
Problems in the Analysis of Trace Metals,
W73-12608 5A

Trace Element Trapping in Pteropod Tests,
W73-12937 5B

Trace Metal Baseline Studies on the Murderkill and St Jones Rivers, Delaware Coastal Plain,
W73-12959 5B

TRACERS
Prediction of Mixing Lengths for River Flow Gaging,
W73-12414 5B

Lithium Silicate Sedimentation Tracer for Shoal Deposit Studies,
W73-12862 5B

TRAINING
WPCF Project Report: A State Certification Program Guide,
W73-12842 5G

TRANS-ALASKA PIPELINE SYSTEM
Channel Erosion Surveys Along Proposed Taps Route, Alaska, July 1971,
W73-12957 2J

TRANSMISSION CAPACITY
Laboratory Investigations of the Transmission Capacity of Frozen and Thawed Soils Based on Data of the Valday Field Laboratory (Vnigl) (Laboratornyye issledovaniya vodopropusknoy sposobnosti merzlykh i talykh pochvo-gruntov (po materialam merzlothoy laboratorii VNIGL)),
W73-12437 2G

TRANSMISSION LINES
Energy Method for Computing the Amplitude of Vibration of Conductor Bundles Due to Wake Effect,
W73-12480 8C

TRANSMISSION TOWERS
Guide for the Design of Aluminum Transmission Towers.
W73-12485 8C

TRANSPIRATION
A Comparison of Rates of Water Loss Through Transpiration of Several Southern New Mexico Phreatophyte Species,
W73-12497 2D

Water Pathways in Higher Plants: III. The Transpiration Stream Within Leaves,
W73-12652 2I

TRANSPORT DEPLETION
Trace Element Trapping in Pteropod Tests,
W73-12937 5B

TRANSPORTATION
Survey of Water Transportation Potential to Reduce Congestion and Pollution in Washington, D.C. and Other Major Cities.
W73-12363 5G

TRAPNETS
Design of Trapnet with Interchangeable Parts for the Capture of Large and Small Fishes from Varying Depths,
W73-12899 8I

TRAWLING
Exploratory Bottom Trawling in Lake Victoria,
W73-12803 2H

TREARDDUR BAY (NORTH WALES)
Correlated Light and Electron Microscope Studies on Brown Algae. II. Physode Production in Dictyota,
W73-12388 5C

TREATMENT FACILITIES
Detoxification of Kraft Pulp Mill Effluent by an Aerated Lagoon,
W73-12529 5D

Start-up of Biological Treatment Facilities for Pulp and Paper Mill Wastes,
W73-12531 5D

Selecting Waste Water Aeration Equipment,
W73-12534 5D

Rayonier Makes Major Breakthrough in Sulfite Pollution Control.
W73-12542 5D

TRICLAD TURBELLARIAN
Extension of Range of the Triclad Turbellarian Phagocata Gracilis (Haldeman),
W73-12856 2I

TRICLADS (PLATHYHELMINTHES)
The Distribution of Stream-Dwelling Triclads (Platyhelminthes) in North Wales,
W73-12971 2I

TRITIUM
Tritium and Deuterium Content of the Snow in Groenland,
W73-12418 5B

Tritium Measurement of Natural Waters on Oahu, Hawaii: A Preliminary Interpretation (Sampling Period: July 1969 to June 1970),
W73-12499 5A

TROPIC LEVEL
Chemistry and Trophic Status of Seven New Zealand Lakes,
W73-12928 5C

TROPICAL REGIONS
Extremes of Hydrometeors at Altitude for Mil-Std-210B: Supplement--Drop-Size Distributions,
W73-12599 2B

TROTTERS (MISS)
Control of Underseepage by Relief Wells, Trotters, Mississippi; Appendix K: 1969 Pumping Tests,
W73-12597 8B

TROUT (METABOLISM)
Metabolic Effects of PCB (Polychlorinated Biphenyls) on the Brown Trout (Salmo trutta),
W73-12819 5C

TUALATIN (ORE)
Tertiary Treatment of Combined Domestic and Industrial Wastes,
W73-12512 5D

TUFA
Observations of Tufa Deposition,
W73-12730 2K

TUNDRA
Simulations of Meteorological Variations Over Arctic Coastal Tundra Under Various Physical Interface Conditions,
W73-12983 2B

TUNICATES
Biomass Characteristics of the Asidian Molgula Manhattensis (Dekay),
W73-12880 5A

TUNNEL CONSTRUCTION
Evaluation of Hydraulic Properties of Rock Masses Influenced by Major Heterogeneities,
W73-12468 8E

TUNNEL DESIGN
Stress Distribution Around a Tunnel Situated in a Layer Under the Action of Gravity,
W73-12490 8E

TUNNEL PRESSURES
Stress Distribution Around a Tunnel Situated in a Layer Under the Action of Gravity,
W73-12490 8E

TUNNELS
Stress Distribution Around a Tunnel Situated in a Layer Under the Action of Gravity,
W73-12490 8E

TUPELO GUM
Nutrient Uptake by Tupelo Gum and Bald Cypress from Saturated or Unsaturated Soil,
W73-12828 2I

TURBIDITY
Mathematical Simulation of the Turbidity Structure within an Impoundment; Hydraulic Laboratory Investigation,
W73-12562 8B

TURBULENT FLOW
Observations of Intermediate and Small Scale Turbulent Water Motion in a Stratified Estuary (Parts I and II),
W73-12424 2L

Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-12506 5B

ULTRAFILTRATION
Viruses in Metropolitan Waters: Concentration by Polyelectrolytes, Freeze Concentration, and Ultrafiltration,
W73-12867 5F

ULTRASTRUCTURE
A Study of Inorganic Salts Requirements and Effect on the Morphology of Marine Bacteria,
W73-12628 5C

UNCONFINED SATURATED FLOW
Water Levels Near a Well Discharging From an Unconfined Aquifer,
W73-12777 4B

UNDERGROUND STORAGE
The Disposal of Wastewater Underground,
W73-12781 5E

UNDERSEEPAGE
Control of Underseepage by Relief Wells, Trotters, Mississippi; Appendix K: 1969 Pumping Tests,
W73-12597 8B

UNSTEADY FLOW
Ground Water Models With Parallel Linear Reservoirs,
W73-12723 2F

UNSTEADY RADIAL FLOW
Water Levels Near a Well Discharging From an Unconfined Aquifer,
W73-12777 4B

UPPER CHESAPEAKE BAY
Upper Chesapeake Bay Water Quality Studies, 1968-1971.
W73-12601 5A

URALS
Investigation of Lake-Level Fluctuation Patterns and Moisture Conditions in the Middle and Southern Urals (Issledovaniye zakonomernostey kolebaniy urovnya ozer i uvlazhnennosti Srednego i Yuzhnogo Urala),
W73-12725 2H

URANIUM
Determination of Uranium in Urine Specimens Following Their Separation Through Anion Exchange, (Bestimmung Des Urans in Urinproben Nach Dessen Abtrennung Durch Anionenaustausch),
W73-12931 5A

URBAN AREAS
Stream Quality Preservation Through Planned Urban Development,
W73-12518 5G

URBAN DEVELOPMENT
On The Water Pollution in the Area of Urban Development (In Japanese),
W73-12996 5B

URBAN DEVELOPMENT CORPORATION
Annual Report of the New York State Urban Development Corporation, 1972.
W73-12356 3D

URBAN RENEWAL
Annual Report of the New York State Urban Development Corporation, 1972.
W73-12356 3D

An Evaluation of Baltimore Harbor Land Use Potentials,
W73-12361 6B

URBANIZATION
River Channel Change With Time: An Example,
W73-12590 2J

URINE
Determination of Uranium in Urine Specimens Following Their Separation Through Anion Exchange, (Bestimmung Des Urans in Urinproben Nach Dessen Abtrennung Durch Anionenaustausch),
W73-12931 5A

USSR
Problems in the Production of a Spring Flood (Voprosy formirovaniya vesennego polovod-'ya).
W73-12435 4A

Artificial Recharge of Groundwater and Infiltration Basins (Iskusstvennoye vospolneniye zapasov i infil'tratsionnyye vodozabory podzemnykh vod),
W73-12745 4B

Silica In Thermal and Cold Waters (Kremnezem v termal'nykh i kholodnykh vodakh),
W73-12751 2K

USSR (*ABKHAZIA)
Karst of the Arabika Massif (Karst massiva Arabika),
W73-12742 2K

USSR (AKTYNBINSK OBLAST)
Radiation Regime of Lake Chelkar and Adjoining Regions (O radiatsionnom rezhime ozera Chelkar i prilegayushchey k nemu territorii),
W73-12724 2H

USSR (*CRIMEA)
Hydrophysical Properties and Water Regime of Crimean Southern Chernozems in a Field Crop Rotation (Vodno-fizicheskiye svoystva i vodnyy rezhim yuzhnykh chernozemov Kryma v polevom sevooborote),
W73-12744 2G

USSR (KIRGIZ)
Snow Cover of the Issyk-kul' Depression and Its Alpine Environment (Snezhnyy pokrov Issyk-Kul'skoy kotloviny i yeye vysokogornogo obramleniya),
W73-12726 2C

USSR (KRASNODAR TERRITORY-KUBAN')
Characteristics of Water Migration in a Thick Leached Chernozem (Osobennosti dvizheniya vody v vyshchelochennom moshchnom chernozeme),
W73-12743 2G

UTAH
Sediment-Water Nutrient Interchange in Eutrophic Lakes,
W73-12395 5C

Mathematical Modeling of Water Management Strategies in Urbanizing River Basins,
W73-12509 5G

UTAH LAKE DRAINAGE AREA
Coordination of Agricultural and Urban Water Quality Management in the Utah Lake Drainage Area,
W73-12508 5G

VALDAY FIELD LABORATORY
Laboratory Investigations of the Transmission Capacity of Frozen and Thawed Soils Based on Data of the Valday Field Laboratory (Vnigl) (Laboratornyye issledovaniya vodopropusknoy sposobnosti merzlykh i talykh pochvo-gruntov (po materialam merzlothoy laboratorii VNIGL)),
W73-12437 2G

Estimation and Forecast of Water Losses During a Spring Flood to Groundwater Recharge for Watersheds in Northwestern European USSR Based on Data of the Valday Field Laboratory (Otsenka i prognoz poter' vody v period vesenne go polovod'ya na popolneniye zapasov gruntovykh vod dlya vodosborov Severo-Zapada YeTS (po materialam VNIGL)),
W73-12439 2F

VALLEYS
Climatic Change and Arrested Meander Development on the River Severn,
W73-12737 4A

VALUE
Valuation of Timber, Forage and Water from National Forest Lands,
W73-12701 6B

VARIABILITY
Evaluation of Hydraulic Properties of Rock Masses Influenced by Major Heterogeneities,
W73-12468 8E

VEGETATION
The Influence of Vegetation on the Redox Profile in the Sediment of Grane Langso, A Danish Lobelia Lake,
W73-12379 5C

VEGETATION EFFECTS
Measuring Public Responses to Vegetative Management,
W73-12408 4D

Black Phytokarst From Hell, Cayman Islands, British West Indies,
W73-12593 2J

VEGETATION ESTABLISHMENT
Stone and Woodchip Mulches for Erosion Control on Construction Sites,
W73-12463 4D

Control of Mine Drainage from Coal Mine Mineral Wastes - Phase II - Pollution Abatement and Monitoring,
W73-12516 5G

VERMONT
Considerations for Effective Sloping Land Drainage Systems,
W73-12933 4A

VERTICAL DISPLACEMENTS
Simplified Calculation of Embankment Deformations,
W73-12473 8D

VIBRATION (AEOLIAN)
Energy Method for Computing the Amplitude of Vibration of Conductor Bundles Due to Wake Effect,
W73-12480 8C

VIRGIN ISLANDS
Insecticide Residues in Water and Sediment from Cisterns on the U.S. and British Virgin Islands - 1970,
W73-12894 5B

VIRGINIA
Effects of Proposed Dock Expansion at Newport News on Tides, Currents, and Shoaling; Hydraulic Model Investigation,
W73-12566 8B

Forecasting Storm-Induced Beach Changes Along Virginia's Ocean Coast,
W73-12584 4A

Flood Insurance for Virginia.
W73-12690 6F

VIRUSES
Viruses in Metropolitan Waters: Concentration by Polyelectrolytes, Freeze Concentration, and Ultrafiltration,
W73-12867 5F

Poliovirus in a Water Supply,
W73-12922 5B

Viruses Infecting Peaches in the Murrumbidgee Irrigation Areas of New South Wales,
W73-12981 3F

VIRUSES (FISH)
Handbook of Fish Diseases for Veterinarians and Biologists,
W73-12813 5C

VISCOSITY
Heated Sensors for Flow Measurements,
W73-12618 7B

VOLTAMMETRY
Voltammetric Study of the Hydrogen Ion/Hydrogen Couple in Acetonitrile/Water Mixtures,
W73-12872 2K

WALES
The Distribution of Stream-Dwelling Triclads (Platyhelminthes) in North Wales,
W73-12971 2I

WALES (LLYN TEGID)
The Profundal Fauna of Llyn Tegid, North Wales,
W73-12823 2I

WALLEYE
Conversion, Maintenance and Assimilation for Walleye, Stizostedion Vitreum Vitreum, as Affected by Size, Diet and Temperature
W73-12832 8I

WARSAW (POLAND)
Construction Costs of Water Supply and Sewage Networks in Poland--1961-1970,
W73-12703 6C

WASHINGTON
Methods for Pulp and Paper Mill Sludge Utilization and Disposal,
W73-12519 5E

Grays Harbor Estuary, Washington: Report 2. North Jetty Study,
W73-12581 8B

Dispersion, Dispersal, and Persistence of the Annual Intertidal Alga, Postelsia Palmeformis Ruprecht,

UNIV. OF ILL. URBANA-CHAMPAIGN

☆ U. S. GOVERNMENT PRINTING OFFICE : 1973 O-LT - 542-951 (7)

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

U. OF I. URBANA-CHAMPAIGN

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
